CUMBERLAND, B. C., Nov. 12.—*Editor Forest and Stream:* The tracking here has been good recently, for several inches of wet snow have fallen, and the hunters have killed a good many deer.

On the other hand, there has been an unusual number of cases of men lost in the timber, and certain parties have been out searching for a man named George Allison for nearly a week now. Allison was lost Nov. 6, while hunting on the mountain near Quartz Creek. He and his companion started from camp together to hunt on McDouglas Mountain, but when the companion, M. Hennessey, returned to camp in the afternoon, Allison was not there, nor did he get in at all. The next morning Hennessey looked for Allison for some time, but failing to find him, returned to the settlement and got help. The search was continued, but at last accounts without result. It is feared that some accident has happened, since Allison knew the ground well, and could hardly get lost. When he left camp he had no food with him and was lightly clad. Since then snow has been falling and the weather has been cold, so that if he had fallen and injured himself, there is danger that he may have perished from the cold.

All the other lost men have found their way to camp.

G.

Surgeon-Colonel Pringle writes to the London Times concerning an interesting example of elephantine memory. At the Zoo the other day, with all the Anglo-Indian's regard for respect, he desired the elephant his little boys had been riding to "salaam karo" before he got his bun. The elephant looked at him hard and thought it over for a bit, then he sm—no he did not smile intelligently. He remembered his manners, as they say in the nursery, and made most correct salaam, to the utter amazement of his keeper. The incident is worth noting, as it appears that this elephant has spent seventeen years in the Zoological Gardens, and inquiry revealed that he had never been requested to salaam since his arrival.

Maryland "Duck Degenerates."

THE Baltimore American says that John Henry Keene, a well-known lawyer and hunter of Baltimore, recently spent several days ducking. He returned with the opinion that the sport in Maryland is more than ever in peril. The illegal use of nets constitutes the greatest danger. Mr. Keene said: "The epoch in the game history of Maryland is unmistakably in its decline. The epoch of the pot-hunter degenerate is unmistakably announcing its reapproach. If some decisive action is not immediately taken, Maryland wild duck history must be shortly written. The duck degenerate has shown himself extremely fertile in most diverse directions. Formerly this midnight assassin prowled to his prey with a dark lantern and heavily loaded swivel. Stealthily he stole upon the quietly feeding rick of canvas, redhead, mallard and baldpate; at one fire the dead fowl lay scattered in drifting heaps.

The present system of the duck degenerate is that of imminent perdition and destruction, and the duck degenerate now dominates every tried duck river and cove in Maryland. The new despoilers have appeared with an able body guard even upon the flats at Havre de Grace, Northeast River, and all the environments of that great feeding ground. No one throughout all Maryland, it seems, dares to molest or make the duck degenerate afraid. They pursue their own way with smiling serenity. Their instruments of torture are an improvement upon the Indian fashion. They can, and do, rack every duck ground and feeding marsh in Maryland. The cowardly degenerate now snares the ducks by nets. These nets have meshes into and through which the tired duck dives for his food. The ground is first sown with corn. When the duck redives for the surface, his neck and head pointing upward, he comes with all his force and finds himself entangled in the meshes of the net, which close. The duck misses the opening into and through which he first plunged. Before the break of day the duck degenerate fishes the net, and thousands upon thousands of these captives go to the Northern markets. Seldom are they seen in our markets. The naphtha launch fiend does not stand upon a much higher plane than his brother degenerate. He sails noiselessly upon the feeding rick, so screened that he cannot be seen, and when in range pours his deadly volley into the quietly feeding brood. Is it strange that the wild duck deserts his favorite famous Maryland feeding grounds?

A Bad State of Affairs.

SAGINAW, Mich., Nov. 17.—*Editor Forest and Stream:* Here are some samples of how the game and fish laws are not enforced in Michigan: I was fishing north this summer and heard a hound running, and soon after two shots. My driver said that was deer, and informed us the next day that a doe had been divided up among them. I said: "Why don't you report these things to the game warden?" and he said. "Not much, we all stand in and get some of the meat."

Last week I was at Harrison on a shooting trip, and our driver said that three weeks before (and mind you the season had not even opened then), a party of five one Sunday went up to one of the lakes and drove in some deer and kild two, and said they could get deer all summer any time they wanted to. I spoke about the trout in Cedar and Tobacco, and asked him if they got any large ones, and he said the big ones were all in Town Line Lake, but he said the only way to get them was to spear them; and all summer long they could go up there with a party whenever they felt like it, light a jacklight at night, go out with a spear and fill up a boat in no time. He said: "We got one weighing four pounds awhile ago."

The birds around Lake Station have been completely cleaned out, as I understand it, by two local hunters who hunt entirely for the market. This last week there has been a market-hunter from the south part of the State up around Evart.

The other day a man stopped into the Country Club with a lot of quail and partridge for sale.

W. B. MERSHON.

One of the Old Guard.

ELIZABETHTOWN, N. Y., Nov. 12.—Another of the "old guard" has been summoned to answer the last roll call. Sam Saunders died at Schroon Lake last week. He was truly one of the old-timers. He was probably the most skilled blacksmith who ever operated in Essex county, and as a hunter and trapper his fame had reached far beyond the limits of the Adirondacks. He began hunting in the now famous Boreas region "way back in the forties," having for a companion in those then lonely wilds our late departed friend, Elijah Simonds, of Elizabethtown, than whom a better hunter and trapper never lived in any age or any country. There was then no settlement in the Boreas region; in fact, no road, except "the poorest kind of a wood road." However, there they passed many happy weeks together, then both in the prime and vigor of fine young manhood, killing "loads of deer" and other game. Elijah held Sam, as he always called his senior hunting companion, in high esteem, and Sam thought Lige the most wonderful man he ever hunted with. Sam made the best bear trap springs obtainable in the world, his hand-hammered axes ranked high and his fish hooks beat all competitors. Up to last summer he made fish hooks for New York parties. Sam was a good story teller and had hosts of friends and no enemies that we ever heard of. He was unquestionably the greatest character that Schroon Lake ever knew, and summer tourists will miss his quaint sayings. G. L. B.

North Carolina Conditions.

PINEHURST, N. C., Nov. 20.—I am not a calamity howler, but for general, all-round queer conditions, the last twelve months beat the record.

Last year it rained all the time down here; and now it is as hot and dry as August. Yesterday it was 82 degrees in the shade; and it has been that way for days. Result, birds are in the deep and thickest cover, where they cannot be shot. PINK EDGE.

Some Game Weights.

BROOKLYN, N. Y., Nov. 23.—In a two days' shooting trip in Connecticut my guide and I bagged one squirrel, five quail and thirteen partridge. We flushed about sixty partridges in our two days' journeying. The weights of above birds were as follows: One very large male partridge, 1 lb. 12 oz.; four, 1½ lbs. each; three, 1 lb. 7 oz. each; two, 1 lb. 6 oz. each; two, 1¼ lbs. each, and one weighed 1 lb. 1 oz., and had one leg, part of its breast and its entrails shot away. Two quail were 8 oz. each, two were 7 oz. each, and one 6½ oz.

I enjoyed the trip amazingly, as the weather was fine, though rather warm, and culminated in a driving rain storm in the evening, through which we were compelled to drive seven miles to the boat.

The success of the trip, however, offset the rain, and I do not care to think how I would have felt if the rain had descended earlier and thus cut short the sport.

W. N. E.

New Jersey Ducks.

HARVEY CEDARS, N. J., Nov. 21.—Mr. E. J. Davis killed 7 brant in one shot on Wednesday, and 8 broadbills in one shot on Thursday, with a No. 12 gauge gun that he has been using steadily for 23 years. Mr. Davis and Mr. Davidson got 265 ducks in four days, which they shipped to their friends. D. M. WHITE.

New York League.

THE annual meeting of the New York Fish, Game and Forest League will be held at the Yates Hotel, Syracuse, N. Y., at 10:30 A. M., on Dec. 4, 1902, and a full attendance is hoped for.

The objects of this Association are to create and foster a more general public sentiment in favor of Fish, Game and Forest Protection, to procure the enactment of laws for the protection of fish and game, and for the preservation of our forests, and to promote the observance of such laws.

In order to carry out these objects, we most earnestly ask the co-operation of all fish and game clubs and associations within this State, who are not already enrolled in the League, and urge upon them the great desirability of joining forces with us in order to secure yet more united effort in attaining these objects.

The initiation fee of $5, including as it does the dues for the year commencing on the first Thursday after the first Monday in December, when our annual meeting takes place, gives to each club the privilege of sending two delegates to the annual meeting.

The game laws of our State are at present in much better shape than they were a few years ago.

The constant tinkering by the Legislature with the game law is, however, a serious menace to fish, game and forest protection. Bills are constantly being introduced which, aiming to grant exceptional privileges to certain localities, create a general feeling of distrust, and seriously interfere with the enforcement of good measures.

The careful weighing of the merits or faults of proposed game legislation, by the persons most interested, the indorsement of what is deemed desirable, and the opposition to what is deemed objectionable, is the main business that comes before our annual meetings, and after election of officers for the ensuing year, and one adjournment of the said meeting, our Legislative and Law Committee keeps careful watch, during the entire season, of all proposed legislation affecting the game laws. In order that they may be fully discussed at the annual meeting, all proposed amendments to the present game laws should if possible be forwarded to the Chairman of the Legislative and Law Committee, Mr. Charles H. Mowry, Journal Building, Syracuse, N. Y., prior to the first day of December, 1901.

Applications for membership should be made to the secretary, who will gladly give any further information which may be desired. ROBERT B. LAWRENCE, President.

ERNEST G. GOULD, Secretary.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

Simple Remedies for Woodsloafers.

IN the autumn, after the leaves have fallen off most of the trees and vines, is the time when one is quite likely to be badly poisoned by poison ivy or poison oak, for at such times the leaves are not present to warn one who approaches these plants too closely, and many associate the poison with the leaves only and feel safe in touching the vines. This is a mistake, as I know from personal experience, I having been very severely poisoned during January, as well as at earlier times during the winter months, by touching these vines, both with naked and gloved hands.

Some physicians say there is no satisfactory remedy for ivy poisoning, while others recommend sugar of lead and other loathsome concoctions. Here is something better: It is tincture of *Grindelia robusta*, a simple old remedy that will dry up and cure ivy poisoning in a few days, and it is no more unpleasant to use than arnica. Every person who goes to the woods for a stay of any length should carry a four-ounce bottle of this remedy in his kit, as it is likely to save him days of needless agony. Being peculiarly susceptible to ivy poisoning, I have given *Grindelia* a thorough trial, and have found that it cures rapidly and surely. During last month, while in camp, three of our party were more or less severely poisoned, but a country druggist supplied us with this tincture, and it worked wonders in a few days.

Mr. Hough has told FOREST AND STREAM'S readers of the good qualities of lime water and linseed oil—half and half—for sunburn, and his advice is sound. Nothing can be better, and a four-ounce bottle of it, too, should be found in one's ditty bag throughout the summer. I have seen canoeists, especially those of the fair sex, so badly sunburned that they were in agony and could not move hands or arms without the greatest effort, but this cooling lotion relieved them at once, and occasional applications for a few days effected cures. The only objections to this mixture is that the linseed oil is absorbed by one's garments, and is difficult to remove from them; hence some old cotton thing that is soft should be worn next to the skin while one is anointing himself with this remedy.

A third article for the ditty bag is a primer box containing a mixture of equal parts of vaseline, glycerine, mutton tallow, and Japan wax, by weight. For rough or chapped fingers and faces it is fine, as it is not sticky and oily, like some substances put up for similar uses, and it is healing and cooling as well. The first few days one is in the woods he is almost sure to hammer his hands all to pieces in one way or another, and something like this, to apply to bruises and hurts is worth its weight in gold.

Some old woodsmen recommend eating a small quantity of raw venison as a physic, in an emergency, and others say that for obstinate cases of diarrhoea, or even dysentery, flour and water is a sure remedy. The benefits to be derived from the homely old remedy of heated flaxseed being known; anyone suddenly taken with toothache, earache, pleurisy, etc., in the woods, can get relief from a cupful of rice or wheat, placed in a cotton tobacco bag and heated in a frying-pan over the campfire, then applied to the part affected while piping hot. Ever try it? Well, it is almost as effective in driving away pain as was Nessmuk's burning paper plaster for his friend, the doctor's attack of pleurisy while they were in the Michigan backwoods. It is also well to remember that vinegar will relieve a burn, and as vinegar and burned fingers are often found in camp, the relief should be at hand.

PERRY D. FRAZER.

New Publications.

Samoa 'Uma.

THE decision of King Oscar of Sweden in the question at issue between Germany, Great Britain and the United States lends a peculiar timeliness to Mrs. Churchill's charming volume "Samoa 'Uma," which is just published. The King of Sweden was the arbitrator in the controversy between the three powers, and he has decided in favor of Germany and against the others.

Few of us have any idea where Samoa is, who are its inhabitants what its products. But the readers of FOREST AND STREAM are better off than most people in this respect, since they have had the opportunity of reading many of Mrs. Churchill's delightful descriptions of those far off islands. No one could be better equipped than she for writing of these people, since for four years she resided among them, was a friend to their men and women, witnessed many of their peculiar customs, took part with them in their hunting and fishing, and dug down into the ways of their lives and the motives which animated these ways as deeply as it was possible for any one to do, in the time at her command. If we add to this the fact that Mrs. Churchill is a trained writer and has a peculiarly happy style, it will be seen that her volume ought to contain—as in fact it does contain—more about Samoa, and that more interestingly told, than any volume ever written about the South Sea Islands.

For eight or ten years—during the very time that Mrs. Churchill resided there—the Samoan question was one of vivid active interest, and for a number of years there was decidedly more than a possibility that the country would go to war with Germany over Samoa. This condition of things has impressed the name at least of the islands on the memory of the American people, who have now an opportunity to learn all about the interesting group. It was high time that the study of these people should be taken up, for they are changing as rapidly, as all other primitive peoples change when brought in contact with the white race, which, notwithstanding all its boasted civilization, takes away from the savage much that he has of good, and gives him much that is bad in return.

Perhaps there is no way in which the contents of Mrs. Churchill's book can be better shown than by giving the titles of some of the twenty-four chapters included in its 300 pages. These are: The Real Samoa, The Samoan Family, The Samoan Housewife, Courtesy and Ceremonies, Kava, the Ceremonial Drink, Music and the Siva, Handicraft and Art, Fishers and Sailors, Shooting the Apolima Passage, The Weed that Catches Fish, Torches on the Reef, The Palolo Anniversary, The Chase of Rats, Things that Creep and Crawl, Wreck of the Schooner Lupe, Samoan Fickle Brides, The Vampires of the Tuasivi, The Beach Comber and the Missionary, Copra and Trade, The Tale of Laulu's Hunt, The Great Vaila Steeple Chase, The Sliding Rock of Papas'ea, Some South Sea Hoodoos, Papalangi Life.

Here, then, we have descriptions of the region, its people, their ceremonies, their arts and occupations, the way in which they live, many of their old traditions, and a chapter on the life of the white people obliged to reside on the islands. The field thus is a large one, and it is fittingly expressed in the title of the book, which means "All Samoa." The story is well told, and is of fascinating interest throughout.

Mrs. Churchill's first chapter gives us in compact form the chief facts in the history of Samoa, as concerns the outer world, from the beginning up to the time of its partition between Germany, Great Britain and the United States. The place became important to us because it lay on the border of the migratory course of the sperm whales through the Pacific, and it thus was early a point of call for these New Bedford and Nantucket whaling fleets which followed the herd down into the Antarctic Seas. The strained relations between the civilized powers claiming interests in Samoa were almost at their height in March, 1889, when the memorable hurricane took place in Apia Harbor, and three German and three American war vessels were destroyed or wrecked. The partition of the islands about ten years later put an end to the territorial quarrels, and it is likely that before long Samoa will lapse into the half forgotten condition which it held for nearly fifty years after Wilkes made his treaty with the Samoans at Pago Pago, in 1839.

The most interesting thing that can be learned about any primitive people concerns their social organization, and this Mrs. Churchill treats very fully. The Samoan has but one wife, but he may change his wife at any time, or the wife may change her husband. Marriage, therefore, is only temporary, lasting during the pleasure of the two parties to it. Children born during the existence of the marriage belong to the husband's family, but if born after marriage has been dissolved, to the family of the wife. A child on reaching adult life may not marry into the family of either father or mother. As soon as weaned, the child becomes eligible for adoption into another family, and by such adoption separates himself completely from his blood relatives, and becomes as much a member of the new family as though he had acquired membership in it by birth. But he cannot marry into the families of his blood parents. Thus his actual birth is remembered against him. Adoption is so common, that probably one-third of all Samoans, men and women, are members of families other than those into which they were born.

The male child chooses a name for himself at eight or ten years of age, and at fourteen or fifteen he is tattooed and becomes a man. He may now marry, and go to war, and becomes a worker—one of the productive members of the community. Property is actually held in common, though nominally it all belongs to the head of the family—using the word in the sense of clan. The head of the family is elected, but may resign, may lose his office by absence, or may be removed at the pleasure of those who elect him; the election being by unanimous vote of all the members of the family, male and female.

The Samoan housewife occupies a position of dignity and influence. She is not less important than the man as a member of the community. She is eligible to certain honors, and great respect is paid to her. How her days are spent is interestingly told in the chapter on this subject. Her last duty of the day, after all the household has gone to bed, is to lift out of its wire frame the lamp which has been burning all the evening, and turning it down until the flame is small, she places the lamp on the floor, that it may watch while all sleep. Why does she do this?

"As a good Christian woman she is sure that there are no wandering demons of the night, such as her people used to believe in when they were heathen, and knew no better and had to keep the fire burning all night long to scare away the evil spirts. Of this she is sure in the broad light of day. But in the evening, when it is dark and still, she will tell you there is no such reason now to keep the lamp on a glimmer, but after all it does no harm, she says, and it would be convenient if any one should awake and want to smoke, for then he could toast his tobacco leaf and light his cigarette at the flame. This night, and every night, there is not a Samoan house in which men are asleep, which does not give out the faint glow of a lamp turned low. And the demons of the old times never enter a house which shows this protection."

Here is a charming little essay on Samoan music: "It is natural for the Samoan to burst into song on any occasion. The canoe melodies are as old as the life of the people. Women at work about their houses are always singing, men delving in their lonely plantations lighten toil with song. At the great games of cricket or stick-throwing, in which village contends against village, there is always a chorus of singers. When the frequent processions move across the *malae* on any of their many errands, the presentation of a gift of food, the exhibition of ancient fine mats, there is always the music of singing. Every night at the lighting of the fires as the signal, itself a heathen survival, but now the signal for evening prayer, there is the singing of a hymn. On Sundays, and often

during the week, the same sound of melody swells from the village churches. When the kava is served to merry gatherings in the evenings there is a game of forfeit; after the calling of the cup the recipient must either recite a legend or sing a song, else he can have no drink. Almost all the knowledge of the past is preserved in chants and songs to be handed down with music.

"All this music is vocal, the human voice is the only instrument. The Samoans never attained to the slightest beginning of the idea of fixity of musical values which has culminated in the orchestra. They have a form of flute; with the bamboo growing in all the forests it would have been wonderful if there had been no recognition of its sound-producing value. But the island flute was an instrument of small compass, it was pierced with three holes, but the stops follow no regular system, and therefore are of no service in developing a musical scale. And this flute was blown at the nostril, not at the lips. Its sound is a faint and feeble note, too small of volume to accompany the voice, and with too little flexity to reproduce the tunes of the common songs. They are not whistlers; many of them do not know how to make the sound through puckered lips, a whistle is not used even to call a dog. The only development of the instrumental idea as an assistant to the voice has been along the line of the drum. They have drums of varying sizes, but of one general type, a log of wood somewhat like their canoes in shape and hollowed out through a slit on the upper surface. Some of these reach the length of ten or twelve feet, and give a note correspondingly deep. From this size they grade down to those of less than a foot, which may be carried in the hand. The drum sticks vary in proportion, from the single club which is used on the largest, to the two wands employed on the hand drums. The sharp tones of these excavated drums are employed only for signal purposes, to call the people to meeting, to sound the curfew, which sends the children scurrying off to bed. The drum is used in music, a mere measurer of time, is hastily made by rolling any mat off the floor to surround a bundle of a few sticks; it is beaten by a stick in each hand; in choruses it is usually supplemented by clapping of the hands.

"Rarely in these days does one hear the chanting of the old legends; the older people are becoming very jealous that the knowledge of them should not be spread among the Papalangi foreigners, the younger people are scantily familiar with the old forms of intoning. The reciter droned a large part of the poetry of these tales on a low note; from this he passed suddenly to a higher pitch and chanted a short passage, and then the hearers broke out into a lyric chorus of certain parts, after which the reciter returned to the droning recitative. From those lyric choruses, at first subordinate to the chants, has developed the music of the Samoans."

In the chapters that follow the more serious descriptive parts of the work are given vivid descriptions of adventure, of the habits of the people, and of the part Mrs. Churchill took. Her energy and her fearlessness took the author into many situations which were difficult enough for a civilized woman, but her unfailing cheerfulness and courage invariably brought her through.

The volume is beautifully illustrated with twenty-four full-page plates, including a portrait of the author, and the mechanical execution of the volume is all that can be desired. It is published in two editions, one on antique deckle-edged paper, uncut, with rubricated title page and gilt top. This edition is limited to 500 copies, numbered, and signed by the author. Price, $2.50.

The less expensive edition, price $1.50, is on ordinary paper.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Reminiscences of an Octogenarian.*

Part I.

BY THE OLD ANGLER.

"No life, my honest scholar, no life is so happy and so pleasant as the life of a well-governed angler."

—*Izaak Walton.*

THE Ristigouche, from Dalhousie at its mouth to the junction of Kedgwick, some sixty-five or seventy miles, is unbroken by falls, cascades, rough waters, or even by rapids of any magnitude. It is a deep, swiftly flowing stream, always delightfully cold, and so clear that the bottom, even at a depth of six feet, is easily seen. In the absence of rapids and rough water, the salmon lie in still, deep stretches that glide away almost without a ripple. An angler accustomed to fish Tobique, Nepissiguit, and Miramichi waters, where the fish prefer angry pools at the foot of falls, above and below rapids, and among rough waters, visiting the Ristigouche for the first time, would pass miles of smooth, rapid water without taking the trouble to cast a fly, so unlikely would it seem that salmon would rise in such water, even if they were lying in its depths.

Some forty-five years ago, the late M. H. Perley, then Imperial Immigration Agent at St. John, and the late A. L. Light, C. E., in charge of the Quebec & St. Andrews Railroad, then in course of construction, crossed the short portage from Grand River, an affluent of the St. John, and struck the Ristigouche at its extreme headwaters. In a bark canoe, with two Indians from Tobique, one of whom was the Sachem Gabe, then in his prime, they glided down the whole length of the river to Dalhousie without making a single portage. They reported the river, from Kedgwick down, as alive with salmon which would not rise to the fly, and they had to allow their Indians to spear enough fish for camp on their downward trip. It may seem incredible that two good anglers, both of whom had fished the Spey and the Tweed in Scotland, and the Nepissiguit and Miramichi in New Brunswick, should have canoed down the whole course of the Ristigouche without taking a single salmon with rod and line. But the writer conversed with them both on their return, and finds no difficulty in believing their report nor in accounting for their unique experience. They had not learned to manipulate a fly as the small boy does his worm.

When the writer first visited the Ristigouche, thirty years ago, he was met at Metapedia by the late John Mowat, then a fishery warden on the Quebec side of the river. Born at Dee Side in Scotland, he had been reared from boyhood on the banks of the Ristigouche; had been hunter, trapper, lumberman, farmer and fisherman; he knew every mile of the main river and all the salient features of its principal tributaries—Metapedia, Upsalquitch, Patapedia and Kedgwick. In his boyhood, Dee Side Farm, named after his old home, was the highest point on the river to which civilization extended. Above that, only the Indian, the hunter or the lumberman broke the silence of these vast solitudes, except when the bull moose or caribou bellowed his challenge to some intruder who sought to join the herds. At that time the Ristigouche Salmon Club had not evolved, and few anglers ever went higher than the pools above and below the present railway bridge at Metapedia station. These pools were then, as they are still in the last half of June, well stocked with fresh-run salmon, and were free to all fishermen, whose love of sport induced what in these days was considered a tremendous journey. These were the "gold old days" before millionaires tempted riparian owners with fabulous sums and formed a "trust" which shut out all but moneyed men from the sport of salmon fishing with rod and line. In these pools the fish seldom take the fly above water. Mowat took one in his canoe to the head of the long, deep, still pool a few hundred yards above the bridge, and told me to try there. The pool was then about three hundred yards in length; deep, black, almost without a ripple, flowing swiftly but smoothly, as if oil instead of water was running past and beneath the anchored canoe. Accustomed to the broken and dancing waters of the Miramichi, the rushing and troubling cascades of the Nepissiguit, the Old Angler laughed at his guide; but at his behest made his best casts and played a Jock-Scot across the surface right and left in a manner he thought would tempt any salmon that lay within sight of the fleeting lure. After repeated casts all round without a sight or sign of fish, the guide advised that the fly sink beneath the surface and play it as a bait. This was something new to the writer, and he thought it queer salmon angling; but "live and learn" being one of his pet proverbs, he considered his most artistic Jock—on whose dressing he rather prided himself—a good fat worm, and proceeded to jig it gently up and down, as he used to fish for "sea trout" through the ice when a schoolboy at Newcastle, on the beautiful banks of the Miramichi, the most wonderful fish river in the world. Just here let me digress to tell your readers that in the tideway are sturgeon, mackerel, cod, pollack, herring, lobsters and oysters; up river there are salmon, bass, shad, gaspereau, trout, smelt, frost-fish and eels, all of which the writer has taken in its waters from boyhood to middle age. Here are fifteen species of commercial food fishes, taken in large quantities from a single river, in northern New Brunswick. If there is another like it in the world the writer does not know its whereabouts.

But, *revenons a nos moutons,* the river ran with such velocity that it was difficult to keep the fly submerged, and as artistic casting was useless, the fly was splashed out with the sole view of getting it under water and working it as a bait. I soon had a bite, and acting instinctively from acquired habit, made the turn of the wrist, which long practice with the fly on other waters had rendered automatic. The line came home minus the fly—and Mowat laughed! Several successive attempts cost me leaders, knotted from gut that was a guinea a hank, and flies that cost hours of careful dressing—and Mowat laughed—until I got so excited and nervous that I was glad to retire to the stretches below the bridge and try to get cool by catching some of the fine *fontinalis,* erroneously called sea trout, which rose gallantly to the fly and sometimes took it in mid-air, which no salmon was ever known to do on the Ristigouche or its tributaries. On that occasion the Old Angler had the chagrin of leaving the river without landing a salmon, which fact, with the loss of many leaders and flies, but above all, the unmerciful jibes and irritating laughter of Mowat, made the visit memorable.

On subsequent visits the writer partially overcame old habits and acquired the art of allowing the fish to hook themselves, which they will do if the fisherman will keep his fly moving under the surface and refrain from striking when he feels the fish. *Me judice,* this is but poor angling; but when the fish is securely hooked, he will give the angler all the exercise and excitement he wants and his tackle all it will bear to bring him to gaff, as the salmon of the Ristigouche seldom weigh less than eighteen or twenty pounds; they often run from twenty-five to thirty, with an occasional fresh-run beauty that will turn the scale at forty pounds.

The style of fishing is admirably suited to the millionaires of the Ristigouche Club, who now control almost the whole fishing of the river, and its main tributaries. Seated in a low chair in the bottom of a canoe, into which he has to be assisted for fear of upsetting, well supplied with costly cigars and iced champagne, a double-barreled breechloader at his side, one tube charged with duck shot, the other with ball cartridge, he sets off after a Lucullian breakfast and is paddled to the water he intends fishing, his face protected by an elaborate mosquito mask, and his hands by immaculate kid gloves, minus the finger tips. Arrived there, his attendant, generally a half-breed Indian from Mission Point, on the Quebec side, selects and attaches the fly he considers suitable for the day, and the water, all of which are profound mysteries to the club house angler, who proceeds, with a swish upward and swash downward to get it into the water. At the end of a short line and on a straight rod he sways it up and down the current as the small boy manipulates his gad and line of twine. Often he gets plenty of bites, but loses three fish out of every five that hook themselves. Unable to stand up, his guides humor the movements of the fish by suitable movements of the canoe, so that it is always more by good luck than by skill that the fish is brought to gaff. Very often the wealthy fisherman gets weary of the monotonous motion of manipulating his rod from a low chair and gives it to one of the guides, who does the necessary bobbing till a fish is hooked, when the angler relinquishes his costly cigar and resumes the rod to do what he rightly terms the "killing," which he considers the best part of the sport. The writer remarked to Mowat on one occasion that these fishermen took their outing *otium cum dignitate.* "The *otium* is all right; but the *dignitate,* I suspect, arises from the fear of moving, lest the canoe upsets," he replied with grotesque humor.

This is a fair description of the greater part of the salmon fishing that prevails among the millionaires of the Ristigouche Club; and their ideas of camaraderie—that feeling which makes anglers brothers wherever they meet—were as peculiar as their notions of sport. Their hospitality was confined to asking a visitor in a patronizing way to "have a drink," and that was exercised but seldom. The late Governor Carvell, of P. E. Island, and the present judge of one of the higher courts of Canada, with the writer, when an officer in the Civil Service, paid for our drinks at the bar, which was the most prominent feature of the club house, though the liquids supplied were by no means of first quality; but then perhaps they did not dispense supernaculum to visitors. Of course there were exceptions, and the writer is informed that of late years the exceptions are increasing. A few of the members were both sportsmen and anglers; but these spent little of their time at the club house. With a single attendant, a tent and necessary stores, they sought the most distant and difficult parts of the river, and doing all their own work except paddling the canoe and cooking, found and enjoyed all the sport the salmon of this river can give.

After several visits to the Ristigouche and its tributaries, the writer is compelled to the opinion that for the sportsman who has risen from the ranks of fisherman to the higher grade of angler, there is more sport and keener enjoyment to be had in the Nepissiguit and Miramichi, though the fish of these rivers do not reach more than half the weight of their Ristigouche brethren. The angler who has raised and hooked his salmon by fair casting at Rough Waters, Pabineau or Grand Falls on Nepissiguit, or at Chain of Rocks, Burnt Hill or Slate Island on the Southwest Miramichi, need not envy the millionaires of the club, though they have shut him out from the Ristigouche and all its branches. The fish of this river, especially those of the largest size, seldom leap more than once, no matter how prolonged is their fight for liberty. By main strength they bore their way up and down the deep pools in which they are almost always hooked. Generally they spend much time in "sulking" at the bottom, from which the guides have to rouse them with their setting poles or by throwing stones at their whereabouts, which can only be guessed at. What sport there can be to the angler who, in his chair, is more the prisoner of the salmon than the latter is of his captor, the millionaire alone can tell. The real sportsman who knows what it is to angle amid the music of rushing waters, would find little pleasure in this travesty of his favorite recreation. On the Miramichi and Nepissiguit, where submerged rocks, sharp ledges and narrow passages help the fish in his fight, he very often leaps three feet in the air half a dozen times in the course of his gallant fight. He who has followed his captive from rock, from ledge to ledge, with the eye of hope and the foot of faith, along a rugged bank and at last brought him fairly to gaff, has enjoyed such sport as the millionaire club man could neither appreciate nor follow. He who can stand at Flat Rock, at Pabineau, and by artistic casting (for nothing else will do it) lure the salmon of eighteen pounds that is surely lurking in the edge of the pitch, to follow the fly and take it on the surface; who can by the gentle turn of his wrist fix the hook in his fish—a Nepissiguit salmon never hooks himself—and by masterly management confine him to the pool above; or failing that, can leap ashore from rock to rock with the arch on his rod, follow him in his mad rushes down the rapids below the fall and bring him to gaff in the eddy a quarter of a mile further down, will have sport that no angler on the Ristigouche ever enjoyed. But the Old Angler is inclined to think the millionaires were wise in their generation, for they secured the one river in Canada which can give them the only fishing they desire; a place where they can blend a dilettantism of angling with the *dolce far niente* of kid gloves and Lucullian gastronomy; a place where the real sportsman and angler would be ashamed to waste the few precious days he can steal from the increasing cares of business life.

Some thirty years have elapsed since the writer found himself in the performance of official duty at Indian House Brook, a small stream debouching into the Ristigouche about thirty-eight miles from Metapedia station on the I. C. R. He was again accompanied by John Mowat, who had risen in the fisheries service to be overseer of the whole Ristigouche District, including both sides of the affluents and estuary of this noble river. Many anglers will remember this officer, and those who knew him well will give a kindly thought to one of the cleverest men who ever lived and died on the north shore of New Brunswick; one of the most genial, hearty and versatile men the writer has met in the course of a long and varied life. Those who have enjoyed the hospitality of Mrs. Mowat and the comforts of Dee Side Farm will remember its spacious hall and large tables, where books, magazines and papers—among which was always the Edinburgh Scotsman, with angling news from the Dee, the Tweed and the Spey—told of the prevailing tastes of her fine family of sturdy boys and winsome lassies, who have since become manly men and motherly matrons. Mowat had a brusque manner and a grotesque humor that spared neither foe nor friend; indeed, the latter were those at whose expense it was most often displayed. Neither time, place nor company ever restrained him from laughing himself and making others join him; even his victims could not help joining the laugh against themselves. In after years, when we met in company with the late Samuel Wilmot, Superintendent of Fishculture in Canada, he told with inimitable skill and humor an incident exemplifying a characteristic weakness which, among Wilmot's friends—and he had many warm and sincere ones—in no way detracted from his many good qualities as *bon camarade.* The writer cannot pretend to relate this as Mowat told it; the most graphic word painter would fail to convey any but a faint idea of the exaggerated style and humorous gestures with which he imitated Wilmot's manner and speech; he can only feebly reproduce from memory the salient points of Mowat's story.

When the Marquis of Lorne and the Princess Louise represented royalty in Canada, they were visited by the late Duke of Argyle and his two daughters. When the Marquis and the Princess went salmon fishing on the Ristigouche for the first and last time, the Duke and his daughters joined the party, which landed from a special train of palace cars at Metapedia station; the whole party consisting of the Duke and his daughters, the Marquis and Princess, Sir John Macneil and Major de Winton, A. D. C.s; a French *chef de cuisine,* and several attendants. Mowat met them on arrival, and the whole party, in two divisions, embarked on board two house-boats built on broad-bottomed scows, each towed upstream by a span of horses to the various points where the best fishing was expected. After two or three days' prospecting, with indifferent success, the two parties joined at Indian House and made permanent camps, the several pools in that neighborhood furnishing room for all to fish. The Marquis was soon tired of a kind of angling

* Those of the last two generations who have read "Sporting Sketches in Maine and New Brunswick," by An Old Angler, will be pleased to renew acquaintance with him in the reminiscences which he promised our readers.

quite new to him, and with Sir John, who liked such sport as little, decided to make a rapid run to Grand Cascapedia on the Quebec side of Chaleurs Bay, where cascades, rapids and rough waters gave a better prospect for such angling as they were accustomed to in Scotland, Ireland and Norway. Mowat and an Indian ran them down the forty miles in a few hours, found them a team to New Richmond at the mouth of Cascapedia, and returned to act as guides to the Princess's party at Indian House.

Mr. Wilmot, who had always a keen eye to the main chance, had bought out a squatter on the Quebec side of the river, and the Land Office had notified him that the transfer of title was in progress, consequently he considered himself riparian owner of all the water in front of the land, which included Indian House and the best pools on that part of the river where the royal party was encamped. He hit on a most ingenious plan to ingratiate himself with the Marquis, in the hope of getting some recognition from the Duke as a brother scientist, for as Mowat told it, "Sammy had a gude conceit o' himsel', and stood in no need of the Hielandman's prayer." He and his son, with two Indians, landed on the bank about a hundred yards below De Winton's camp, and with a tape line and note book proceeded to measure distances, drive stakes and make notes, with all the *empressement* of a civil engineer who had no time to spare. Seeing that De Winton, with the usual *insouciance* of the true Englishman, took not the slightest notice of his antics, as Mowat described his movements, Sammy played his trump card, and called to his son in strident tones, "Chawles, bring the theodotile." Charley shouldered a surveyor's compass fixed on the top of a folding tripod, and carried it to his father, who set it up and "took sights" right across De Winton's tent. This roused the curiosity, or, rather, perhaps the pugnacity, of the blasé Englishman, who lazily strolled down and watched Sammy's antics—thus Mowat, at which Wilmot winced while he laughed. Finding that De Winton would not "rise to his fly," the Superintendent was forced to open the conversation, from which he expected at least an invitation to dinner, and perhaps a presentation to the Duke, for "Sammy had a healthy ambition," as Mowat humorously asserted. At this point it was a liberal education in humorous narrative and dramatic art to hear and see Mowat relate the conversation that ensued between the Superintendent and De Winton. The ingenuity with which he would improvise, imitating to the life the Major's dudeism and Wilmot's attempts at dignity of manner and expression, would have forced St. Anthony to roar with laughter in the midst of his most devout orisons. The writer regrets that these cannot be reproduced on paper, and he would need the humor of Mowat himself to adequately describe them. All he can attempt is to give, in a prosaic way, the main facts as he recalls them. Wilmot had a peculiar mannerism, which all who have known him, socially or officially, will remember with a smile. In conversing, he "struck an attitude"—the left foot advanced, which he trotted in unison with the rhythmic swing of his pincenez to emphasize his points. Mowat's mimicry of these was a piece of natural acting that the writer's old friend, Ned Sothern, could not surpass.

Wilmot—"Er—um—my name is Wilmot—Samuel Wilmot, Esq. You have heard of me, perhaps. I am the Superintendent of Fishculture in Canada."

De Winton.—"Aw, yas! Laying out your pond, I s'pose?"

"Not a pond. I shall dam the brook inland to make my pond. I intend erecting a large and sightly structure for a hatching house, with a convenient landing just here."

"Aw, yas! But see here! Doncher know you'll have to defer all this until the Princess leaves the river? You can't intrude on the Princess and the Duke, doncher know!"

"Certainly not. A great deal of preliminary work has to be done, and meantime the Princess and the Duke and yourself are quite welcome to fish my pools as long as you please."

"Aw, thanks, awfully! Didn't know it was your river! Sorry the Princess didn't ask your permission, doncher know! As it is, you'll have to arrange with Mr. Mowat, who will be here to-morrow."

Saying this in the contemptuous manner that makes the impudence of the worst dude impressive, the A. D. C. turned on his heel and took no further notice of the Superintendent than if he were one of his Indians. Wilmot made his way to Mowat's camp and found that he had already returned from sending off the Marquis and Sir John. To him he related the incident, and expressed his disgust of De Winton's cavalier treatment, all of which was nuts and ale to Mowat, whom Sammy considered as his subordinate—because Dee Side hatching house was in his care.

* * * * * *

Wihin easy reach of this camp are several good pools at the mouth of Patapedia above, and two or three below. These afforded fishing for the whole party, which always met at dinner at 6 o'clock. This dinner was prepared by the chef and his assistant, and was served in two messes; the Princess, the Duke and his daughters, the Marquis and Sir John forming one, while De Winton, with two or three young officers of the staff, the other. Mowat and the Indians preferred their own cooking and took their meals as usual, *al fresco*. The Major had several times asked Mowat to join his mess, but he always made some excuse; he had so much to arrange for the morrow and so many instructions to give the Indians, etc. One evening after mess, the Major came on Mowat and the Indians at dinner, and the following colloquy ensued:

"Mowat, I have several times asked you to join our mess, but you have always made some frivolous excuse. Doncher know, I think you prefer the society of the Indians to ours."

"Oh, no, Major; but you see, I'm master of ceremonies here. I would cut a poor figure at your table, where the formalities spoil my appetite."

"Oh, come! You have some other reason than that. You can be as much at ease with us as you can here, if you choose to put on your society manners. Tell me your reason for preferring to mess with Indians."

"Well, Major, if you insist on knowing, I prefer my food clean!"

"What do you mean? Do you think your food any cleaner than ours?"

"Well, I don't know, but I saw your chef making the coffee for dinner with water the potatoes were boiled in.'

"The lazy scoundrel! I will see to this," and he left in hot haste to lecture the chef on his dirty cooking.

Mowat was a fairly read man for his opportunities, but he was not likely to know that the king of cooks and prince of gourmets—Brillat Savarin—made the discovery that coffee is much improved if the decoction is made with water in which potatoes have boiled; nor is it likely that the better educated A. D. C. was aware that his chef was following the approved mode of the greatest *cordon bleu* of modern times. V.

A Pearl River Camp.—VI.

(*Continued from page 412.*)

We had fish enough and to spare next morning, so concluded to take the guns and go part of the way home with Bob and hunt back to camp.

Crossing the lake to the other side, we found ourselves in the large loop, or island, formed by the lake, and wondered how our friend had crossed the other end, as he was compelled to do, to reach that part on which we were camped. This was soon explained, as he led us to the lower end, where it opened into the river, and there we found a large tree which had fallen across the lake just where it emptied into the river, forming a bridge. In crossing we noticed that the tree lay well for fishing, either out into the river or back into the lake, and concluded that we would come over again in the afternoon and try this new territory.

As soon as we got into the woods Bob made us slip along quietly and soon located a squirrel, which he killed for us. A little further along we treed two, both of which we bagged after some wild shooting on the part of the younger boys, who had insisted upon having a try.

We were tremendously excited by finding a real bear track, which Bob showed us in a soft bit of the swamp, and felt very much relieved that it was so far away from our camp. We sighted another squirrel that led us an exciting chase, and finally escaped, after receiving our whole broadside.

"Old fellow, and tough as rawhide," was Bob's consoling explanation of our failure to bag it.

The woods began to thin out now, and we prepared to turn back, leaving our visitor to continue on home, but he remembering that we were near a bee tree, which he had located on a former hunt, took us to see it. It was a large white oak, and the bee den was in a limb high up. It was the first bee tree we had ever seen, and very interesting. We tried hard to see the bees, as Bob would point up, calling out excitedly: "There! see, see! There they are," but, although we would occasionally say that we did see them, it was probably by faith, and not sight, as a cow would have looked small up as high as we were trying to see bees.

Reluctantly bidding our friend adieu, and urging him to visit us again, we turned back toward camp.

Circling round out into the woods, we hunted over new territory on the return, and soon had two more squirrels. Hearing some one chopping with an ax, not far out of the line we were traveling back, we concluded to be sociable and visit them. As we approached nearer we heard the chopper also singing. Drawing near we saw an old colored man chopping on a felled tree, keeping time with the ax strokes in the following song:

"Hard labor, hard labor,
Hard labor makes de man.
Mammy tole me,
Daddy showed me,
Hard labor makes de man."

Over and over he sang the song, two words to the stroke, until we drew near enough to attract his attention, when he ceased work.

"Mawnin', young gentlemen," he said, taking off his hat and scraping the sweat from his forehead with a crooked and calloused forefinger. "Huntin' is you; I hope you has good luck."

We replied to his salutation and exhibited our squirrels in answer to his question.

"Wha' you stoppin' at?" was his next query.

We told him we were camping out, and described the location of our camp, and also the fact that we had had a visitor, and had accompanied him part of the way on his return home.

"Oh, yes," he said, "I know young Marse Bob and he pa, too. I work some foh his pa mos' every spring, plowin' an' plantin', an' sometimes later in de season choppin' cotton."

Talking further with him, he said he lived back a little toward the edge of the swamp, where he had a little cabin and a few acres of land.

"Yo' all kin des go out dah," he said in a hospitable manner, "an' my ole woman will be proud to give yo' a drink of 'simmon beer. We makes hit ourselfs, an' hit is shore good."

We thanked him but declined the beer, and then asked if he thought his wife would sell us a little bread.

"Suttinly, suh, ef she got hit. We'll des pintedly go see," said he, dropping his ax and starting off. "Hit won't be nothin' but cawn bread, though; kin you all eat dat?"

We assured him, with a suspicious earnestness, that we could eat any kind of bread.

Arriving at his cabin, we found everything neat and clean, and the "old woman" as kind and hospitable as heart could wish. When we had been duly presented as: "Foah young gentlemen what is campin' out an' enjoyin' deyselves," the old lady gave us a hearty welcome. She set chairs out on the little vine-covered porch and brought us fresh water from the well.

"An' you little boys is campin' out; sleepin' in de woods all by you'selves?" she said. "Pears like you mamas would be skeered to 'low you to do hit. Ain't you 'fraid of de bears, wildcats and varmints?"

When assured that we were not and that we had plenty of weapons to protect ourselves, she said in a manner that indicated more desire than faith:

"I sho' hope dey won't nothin' git none of you, but hit is pow'ful reesky."

The old man then stated the special object of our visit, considerately adding:

"Yo' know hit des nach'lly make young folks hongry to git out in de woods, an' dey done et up all de nice bred what dey bring wid 'um."

"I got de pone on a bakin' for dinnah," said she, "an' hit a big one, 'cause de ole man is a scandlus eatah. Yo' is welcome to dat soon as hit done, an' I make ash cake foh ouh dinnah."

We visited while the pone was cooking, the good old woman hurrying it up as much as possible, and when done took our leave, carrying it swung in the least soiled handkerchief belonging to our party.

The old people gave us a cordial invitation to come and see them again, and urged us to be sure and let them know if they could do anything for us, or if we got in any trouble.

Congratulating ourselves on having such kind and friendly neighbors, we laid a straight course for camp, and by walking fast and making no stops, arrived there with our bread yet warm and fresh.

The fish being cleaned and ready to cook, we did not stop to prepare any squirrels for dinner. Fresh corn bread and fish we considered good enough for anybody, and were soon enjoying our dinner. The bread was excellent, and there was quite enough for all.

"I certainly am thankful that the old man is such a 'scandlus eatah,'" said Will, as he finished the third generous piece of corn bread.

After dinner we cleaned our squirrels and put them in our refrigerator—a covered bucket set in the spring—and then all hands laid down for a well-earned rest. It was mid afternoon when we awakened and concluded that we had made up the lost sleep of the night before. After some discussion it was unanimously decided that we would forego our trip to the fallen tree to fish the river and mouth of the lake as intended, and just loaf and have a good time the rest of the day, as our larder was stocked for at least two meals. It was almost like a holiday from school after our constant application to the task of providing our daily bread, or, rather, meat. Since finding the alligator tracks and noting the size of the alligator gars which infested the lake, some of which we had seen that were fully five feet long—we had not felt much interest in the delightful pastime of swimming, but Bob had assured us that we need have no fear of them whatever, provided we kept moving while in the water. They woud, he said, attack a man lying perfectly still in the water, but by striking or splashing, they could be frightened away. Knowing that he had lived all his life on the river and having confidence in his judgment, we concluded to go swimming in the lake. We were soon in and engaged in a contest to see who could swim across the lake the greatest number of times without stopping to rest, it being about fifty yards wide at our landing.

The second trip across I met with a slight accident that effectually put me out of the contest. About two-thirds of the distance had been crossed, all swimming abreast a short distance, when something raked me along the outside edge of the right thigh, causing a smart that showed the skin had been broken, and I immediately concluded that it was the attack of an alligator. I had no trouble in calling to mind Bob's instructions, and knew that I ought to thrash about in the water and shout, but could do neither the one nor the other. In an almost fainting condition I paddled weakly on, managing to reach a log at the bank that extended out some distance, on to which I climbed. The other boys, turning to swim back, called to me, but I only replied:

"Tired."

As I recovered, the thought came that I ought to have told them, and prevented their taking the risk of swimming back, but before I had recovered the power of speech it was too late.

On examination I found my hurt to be slight, consisting of two or three long scratches, which even in my excitement showed plainly to be caused by some sunken limb or snag extending near enough to the surface to graze me as I swam over. The boys swam over and turning back to my side, when slipping into the water I returned with them, swimming carefully "dog fashion," feeling for the snag. I found it, a jagged limb extending up from some sunken tree, and turning my head marked its exact position by a tree on each bank.

My companions had engaged in the sport of scaring me half to death with snake alarms on several occasions, knowing my great fear of all the reptile tribe, and it now occurred to me that perhaps here was a chance to retaliate.

On one occasion they had placed a dead snake inside the tent and persuaded me to go after a gun. I secured the gun and turned to leave the tent, and then discovering the snake, apparently in a position to strike, dived head first through the side of our domicile, demolishing the entire north wall and scratching my face badly. Another time Will coiled a short piece of rope under that portion of the bed on which I slept, leaving the end out, and after we had all settled down for the night began to slowly pull it from under me, crying snake in an excited manner, which caused me to take to the woods barefooted and very scantily attired.

As their fear of alligators was fully as great as mine of snakes, it looked as though my opportunity had come. As we rested a few moments after reaching the bank I spoke of a cool spot in the water that was probably caused by a submerged spring, and invited them to fall in line behind me and I would guide them over it. Taking my bearings carefully, I started across, followed by my unsuspecting companions, and coming to where the snag was, swam high, passing over without a scratch. Turning on my back so as to have a good view, I swam on.

Will was next, then Walter, Jim being last. The snag caught Will fairly in the groin, and as he described it afterward, he felt teeth meet through his body. For a minute he came as near walking on the water as ever a boy did, while the woods rang with his frightened yells. Walter was too astonished to change his course, and a moment later he grounded on the snag. His performance was very similar to Will's, only, if possible, he was more noisy. Jim turned back and swam for dear life, also yelling and splashing, and as I was shouting at the top of my voice to stimulate them and keep up the scare, it was a merry din. I venture to say that unless a can-

vention of panthers had broken up in a free for all fight, nothing like it had ever been heard in that neck of woods.

Will and Walter finally reached the shore and retreated well into the woods, where I left them examining their wounds and fairly blubbering with fright. Swimming to the other side I found Jim lying across a log, retching and groaning as he rid his stomach of the warm water he had swallowed on his stormy passage back to safety. As I paddled across in the boat to bring in the wounded, it occurred to me that they would now each have to bite me with a snake before they could even up the score.

Both boys were painfully scratched and both positive and vehement in their denial of my snag theory. Even after I paddled to it, got into the water and stood on the snag, they were skeptical and urged me not to risk my safety in that water.

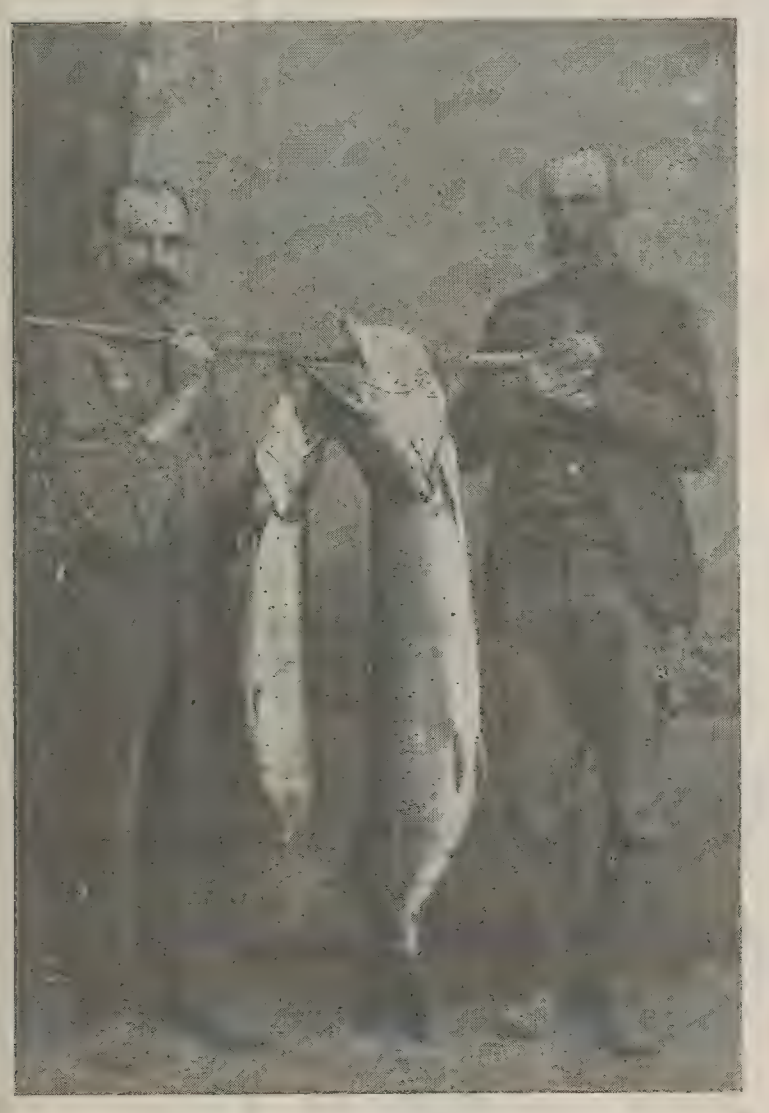
Supper was eaten almost in silence, and our nightly gathering around the fire was not enlivened by the usual flow of conversation.

I had a large amount of fun on hand, but concluded that I had best save it until next day.

LEWIS HOPKINS.

Pennsylvania Muscalunge.

WATERFORD, Pa., Nov. 14.—In your issue of Oct. 25 you publish a record muscalonge caught in the St. Lawrence River, giving the length as 4 feet 8 inches, no weight given. I send you photo of muscalonge caught in our little Lake Leboeuf last August that was 4 feet 7



TOOK THREE MEN TO LAND HIM.

A muscalonge of 44lbs. 2oz., taken by G. B. Skiff, C. E. Fish and L. Z. Fish, Aug. 14, 1902.

inches long, weight, 44 pounds 2 ounces. The small fish weighed 12¾ pounds. These fish were caught with 21-thread Cuttyhunk line. It took two hours to bring the large one to gaff. The fish is not our record fish, but next to it. I have landed seventeen muscalonge this season from 5½ to 15 pounds. My last this afternoon, weighed 8 pounds 2 ounces. F. J. K.

"Not All of Fishing."

IF you've read your Walton you will remember these lines, in which is set forth an ancient exposition of the modern saw, "that it is not all of fishing to fish." Says *Piscator:* "At Trout Hall, not far from this place, where I purpose to lodge to-night, there is usually an angler that proves good company. And let me tell you, good company and good discourse are the very sinews of virtue.

"I'll now lead you to an honest ale house, where we shall find a cleanly room, lavender in the windows, and twenty ballads stuck about the wall: there my hostess, which I may tell you is both cleanly, and handsome, and civil, hath dressed many a one for me; and shall now dress it after my fashion, and I warrant it good meat."

VEN.: "Come, sir, with all my heart, for I begin to be hungry, and long to be at it, and, indeed, to rest myself too; for though I have walked but four miles this morning, yet I begin to be weary; yesterday's hunting hangs still upon me."

PISC.: "Well, sir, and you shall quickly be at rest; for yonder is the house I mean to bring you to. Come, hostess, how do you? Will you first give us a cup of your best drink, and then dress this chub as you dressed my last, when I and my friend were here about eight or ten days ago? But you must do me one courtesy—it must be done instantly."

The King of the Pikes.

THERE is now on exhibition at the office of Mr. Ferris Meigs, at No. 26 Broadway, what is probably the largest pike ever caught in this State. This giant fish measured when caught 43.5 inches long and weighed a plump 25 pounds. It was taken on a common spoon with a naked hook on a hand line in Folansbee Pond, in Franklin county, in September, by Miss Juliet Wilbur Tompkins. Miss Tompkins, who is a short-story writer of no little renown, was enjoying a vacation when she had the fortune to land her trophy. The big fish made an exciting fight, which lasted fully twenty-five minutes. It was mounted in an artsitic manner by Miner, of Saranac Lake, and is to be placed in the collection which the Forest, Fish and Game Commission is making to illustrate the fishes of the State. The usual weight of the fish taken in the pond is about 16 pounds.

"A Vermont Mode."

PHILADELPHIA, Pa.—In FOREST AND STREAM of Nov. 8 you were so indulgent as to publish a communication from me on that long-debated and inconclusive hunting issue, fox-hunting as conducted in the North and the South. To it there have been two replies, both in excellent temper, and both bearing all the evidences of the writers' sincere faith in their contention and in the soundness of the views promulgated in them. I desire to say that, though my communication may have seemed to have a personal trend, it was not intended to be personal. It was directed more at methods than at men.

With your permission, Mr. Editor, I will endeavor to show where Mr. J. H. Monson, in FOREST AND STREAM of Nov. 15, and Mr. W. W. Brown, in the issue of Nov. 22, present some arguments which are fallacious.

Mr. Monson rests his chief defense on the following:

"Now, as to digging out a fox that had been run to earth, while I should not like to do that, I confess that I can see mighty little difference between that and the English fox hunting practice of sending out a man beforehand to stop up the entrances to the holes to which it is thought the pursued fox will run for refuge from the hounds. There may be a difference between stopping up a hole so that the fox cannot get into it and digging him out after he has got into it, but I cannot see the distinction. To me it means just the same for the fox."

I think that with a few seconds of deliberation, Mr. Monson will concede that there is a vast difference between the situation of a fox blocked in a hole and one blocked out of it. In the one instance the fox is entirely deprived of all his natural powers, so far as escape is concerned; in the other the fox is left in the exercise of all his natural powers unhampered. Speed, cunning, endurance, courage—all are nothing to the fox in a hole; they are everything to a fox at liberty. The fox in a hole can be dug out and to a certainty captured ignominiously; the fox at large may or not be captured; but, if captured, he succumbs with banners flying and the honors of war.

I would call Mr. Monson's attention to the fact that, in England, with all the burrows stopped, and an even struggle between fox on the one side and hounds and horses on the other on the earth's surface, the fox frequently escapes.

Let us next consider Mr. Brown's argument. He says:

"From the point of view of the humanitarian, the New England method is the better of the two. It lacks all the elements of savagery found in the English or Southern hunt, where the hunters, who are well enough mounted, arrive in time to see an exhausted fox torn to shreds by the wolfish pack."

I beg to call Mr. Brown's attenion to the fact that the fox frequently escapes; that if the fox's craft, speed and endurance are not sufficient to preserve his body, when the final act comes, it is between the dogs and the fox, not between the men and the fox. He continues:

"From the point of view of the sportsman—yes, but there is no point; there are as many points of view as there are kinds and conditions of men."

I beg that Mr. Brown will permit me to differ with him on this point. While his statement has a certain correctness as applied to men who shoot over setters and pointers, or pursue big game, it does not hold good as regards fox hunters. In England fox hunting is a national pastime. Men in that country have been schooled in its refinements from childhood to old age, as were their ancestors before them through generations far into the unknown past. The fox hunters ride in numbers, and, therefore, all their doings are constantly under the scrutiny of their fellows.

The fox-hunting laws were formulated by common consent, the outgrowth resulting from the experience of generations, and the wisdom of the ages. There is no point on fox hunting—and by fox hunting, I mean fox hunting as conducted in England and the South—but what is covered by law universally accepted. But where the sport is individual, that is to say, when men hunt solitary, as in field shooting and New England fox harrying, then each individual has his own peculiar view point. There is all the difference between them that there is between a rank of trained soldiers and an awkward squad. One in concert acts by certain standards, the other is emphatically individual.

Mr. Brown says: "With us it is a question of the present method, or none at all."

Here we come to the real issue. I concede the right of New Englanders to hunt the fox as they choose, but I object to the term by which they designate it. Fox hunting is a term which has a certain well defined significance during many generations. It denotes the use of horses and hounds in the pursuit. It never contemplated the methods employed in New England. I object to the misuse of the term. Let the New Englander hunt his fox in his own way, but let him adopt a distinct name for it. Call it any name other than fox hunting, a name associated with tradition, chivalry, hard riding and fox-hunting law. Thus, Mr. Brown will note that I do not oppose his methods of hunting the fox, but I do most emphatically object to the malappropriation of an honored title.

In conclusion, I beg to thank Mr. Brown for his generous and most sportsmanlike kindliness toward me. If the opportunity ever presents itself I shall be glad to take him in friendly spirit by the hand and talk over our little differences in a gentle way, as I really feel, even if my words seem to be otherwise.

ALBERT CONVERSE.

"Major's" Cure.

THERE is joy once more at Eagle Lake in the town of Ti. "Major" will hunt with his master once more, and all past disagreements are positively called off. I forgot to say that "Major" is a rough-haired yellow dog, the son of "Mary Jane," a pure blooded Irish terrier bench show favorite, his sire being a plucky Chilson Hill dog of no special pedigree. "Major" is known all over the land by an account of his plucky and successful trailing of a huge black bear two years ago in Peekinoose Swamp and thereabouts, published in the New York Sun. He has the reputation also of being the best all around dog in town, and A. had held him at $75 until the unfortunate gray squirrel trip to the Vineyard, in 1900, when he was "spiled," to use local phraseology.

On that morning dog, master, and a New York man started for the maple and hickory groves along Lake Champlain, ten miles distant, and down the hill toward Ticonderoga. The city man, used to suburban hunting, suggested taking "Major" in the wagon to save his strength, but A. would not hear of it. It might make the dog lazy, etc. So the willing one was permitted to race ahead and behind the fast mare in the clear frosty air, now exploring sheds and barns with rapid pace and then tearing up hill and down dale as he neared some likely place for game or struck a particularly fresh track. On reaching the "flats" and nearing the "squirrel acre," a big bulldog had an argument with the yellow dog, who was quickly called to the wagon, coming in with an ominous limp in his gait. "Major" was in fair shape upon reaching the cover, but seemed to dread the briers where the birds skulked. We needed him just then and were impatient at his apparent indifference. So he was lightly switched and ordered to go and find them. He started off, but soon came slinking back with his tail between his legs in an extraordinary manner. After a good rest we started in again after grays this time, and "Major" kept along with us, treeing a big one and stopping another as it fell wounded. This was training that pleased us all, and he seemed to like it. By and by the grape vines and low scrub oaks needed investigation, and he refused to work, whereupon a second switching was given and a more miserable dog or a more disgusted owner I never saw.

Upon raching the old log farm house Major lay down by the stove and kept so quiet that we actually said good-by and had gotten half a mile on our way home before we missed our dog. Back went A., while I stalked grouse among the withhazels in the pasture at the top of the long hill. Finally the wagon arrived. "He didn't even want to come home with me," said A., mournfully. We journeyed rather silently, hoping that "Major" would forget it in a day or two, but he did not. Nor did the long winter that followed change his mind. He thought that his beloved master had whipped him for hunting birds, and he decided to do no more of it for him in future, although he did not adhere to the rule when others occasionally took him out with the gun. A. had only to say "Hunt 'em out, Maje," to start the dog for home full tilt. I felt sorry for my two friends and hoped to fix things up between them. So, finally, I said prophetically: "He can be cured by the hair of the dog that bit him," as it were. "Let's take him down there again to-morrow and carry him under the lap robe all the way," I continued. "It won't hurt him and maybe he will forget the whipping of last year if he gets orders on the old ground again."

Accordingly, one brisk morning last October, we started off early to repeat our trip to the old log farmhouse, and "Major," albeit much against his will, rode along. He made great efforts to jump out and run home as usual, but the straps held fast, and after going it blind for three miles, he became contented and seemed to take pleasure in the trip, his soft brown eyes appearing from beneath the covers from time to time. We put away "Kittie," the black mare, and got out our armament, a Stevens No. 25 rifle and a No. 12 Baker, with the intention of getting a bag of game, dog or no dog. "Major" skipped and jumped from want of exercise, but appeared to take some notice of things as we passed a clump of raspberry briers. A. encouraged him with a word, but, alas, the old feeling returned, for he came crouching back toward us. I quickly sent A. on ahead, petted and encouraged "Major" and took him with me into a thicket at the edge of a field where I was sure there was a bird. So there was, too, for the dog at once began to trail all over the hill, and as I stood by, hoping for a shot, a roar of wings came from the other side, showing that a noble grouse had been aroused. The dog followed the flight with his eye and legs, and treed the bird several rods off in a big hemlock. I shouted, and A. came up and made a neat long distance kill with his .25 Stevens. More birds flew from adjoining trees and the dog soon barked again, but the brush was too thick to see anything. He then chased a big hare into my pocket, and when his first gray was sighted and treed, A. seemed happy once more. I left at once for a big patch of woods where I thought that Betsey Baker and I would have some sport, but the sun was now very warm, and the grays, although all about me in the thick maples, would only "sing" occasionally, giving me no chance for a shot. I heard a perfect song of joy from the little Stevens, and a jolly obligato from "Maje." So I gulped down my disappointment at coming so far for nothing, glad to know that my old friend was happy in his dog's confidence once more. The shades from Buck Mountain were lengthening as I wearily climbed up the Bliss Hill over my old hunting path where I had carried so much game in days gone by. I found A. quietly chatting under the big poplar with his host about crops, matters and things generally, and he said "The dog is all right. He treed and brought to me several grays, put up more than twenty partridges and I foolishly didn't hit a one."

"Major" was glad to ride home that night, and I am told that his value is again restored, for he now never

makes a "home run" when told by his master to "hunt 'em out."

PETER FLINT.

1011 Carnegie Hall, N. Y. City.

The Fox Can Reason.

From the Richmond Times.

CAPT. JOHN B. EAVES, chairman of the Republican State Committee; J. C. L. Harris, secretary of the committee; Robert W. Logan, United States Commissioner, and J. D. Miller, all except Harris living in the town of Rutherfordton, N. C., were one spring morning chasing a fox. It was a cool, crisp morning, and there was just enough dampness on the leaves and grass to enable the dogs to scent Reynard without making a break. The chase had been going on for two hours and more, and the forty dogs in the pack had been making the welkin ring. The fox was running around in a circle not over three miles across, and the hunters at sunrise had assembled on a knoll about the center of the circle which overlooked the territory which Reynard appeared to have circumscribed for himself in his jaunt with the dogs. The music of the dogs was inspiring and the race was perfect in almost every feature that goes to make this sport the most delightful. The knoll overlooked a ravine about 100 yards distant from where the hunters had taken their stand. Across the ravine a giant and venerable chestnut tree had fallen, and the devastation of time and the elements had caused the bark to drop from the tree. Miller was the leader of the hunters, and while standing on the knoll, as Napoleon did at Marengo, Austerlitz and Waterloo, he saw the fox come into sight with the dogs 400 or 500 yards behind him. The fox ran straight to the chestnut tree and disappeared therein. Up to this time it was not known that the log was hollow. The length of the chestnut across the ravine was about seventy-five feet. As quick as the fox could have traveled through the log he came out on the opposite side of the ravine and made off through the forest. The dogs ran to the log and there lost the trail. The hunters watched them for a few minutes, and then Miller called them across the ravine and put them on the trail, and away they went in full cry after the fox.

In about thirty minutes the fox came in sight again with his tail up and showing no sign of weariness. The dogs were somewhat further behind than before. The hunters watched the fox, and again he ran into the log and out on the opposite side. The dogs halted again and were put on the trail by Miller. The fox was gone about thirty minutes again, came back and again ran through the log. This was the third time the fox had gone through the log, and Miller remarked that every time he came out of the log he looked as if he had been rested and was fresh for the race. The dogs were becoming wearied. The chase had been going on for nearly five hours, and after the fox made his fourth entrance into and exit from the chestnut log Miller went to the end of the log where the fox came out each time and securely stopped it up. In about thirty minutes the fox ran into the log for the fifth time. Miller then stopped up the other end of the log and then cut into the log and extracted therefrom three full-grown foxes.

Great Dane Club of America.

AT a meeting of the executive committee of the Great Dane Club of America, held at the Ashland House, New York, on Nov. 18, 1902, at 7:30 P. M., pursuant to notice, there were present Messrs. J. Blackburn Miller, G. Muss Arnolt, John Hartmetz, Frank Rappolt and C. H. Mantler. Mr. J. Blackburn Miller in the chair. The minutes of the previous meeting were read and approved.

It was decided not to offer any special prizes at the Philadelphia show, as the club could not indorse Mr. F. Freeman-Lloyd as judge of Great Danes.

The application of the Merrimack Valley Kennel Club was also refused, as the name of the judge of Great Danes was not mentioned in their letter. It was moved and seconded to offer a club medal for the best dog, and a club medal for best bitch at the Rhode Island Kennel Club Dog Show, to be held in Providence Jan. 20-22, 1903, as Mr. James Mortimer, the judge of Great Danes at this show, is acceptable to the club.

It was further decided not to offer specials at the coming Westminster Kennel Club bench show until the classification and the judge of Great Danes has been submitted to the club.

Mr. J. Blackburn Miller, the president of the club, presented the same with a silver cup, to be known as the President's Challenge Cup, for the best American-bred Great Dane under fifteen months of age, bred, owned and exhibited by a member of the Great Dane Club of America, and to be won twice by the same exhibitor before becoming his absolute property. Winner to receive a club medal in commemoration of the award, and the cup to be offered for competition annually at the Westminster Kennel Club Show. The thanks of the club were extended to the donor of the cup.

C. H. MANTLER, Secretary.

The Minister's Dog.

The Rev. A. N. Blatchford tells a story illustrating the modern desire for short sermons. A country vicar, he said, once went to fill the pulpit of a colleague who was temporarily absent from home. After the service he thought he would gauge the effect of his discourse by the opinion of that very fair index of public feeling, the parish clerk.

"Well, Rogers," he said, "did you like my sermon?"

"I did," was the reply.

"I hope I wasn't too long?" he anxiously inquired.

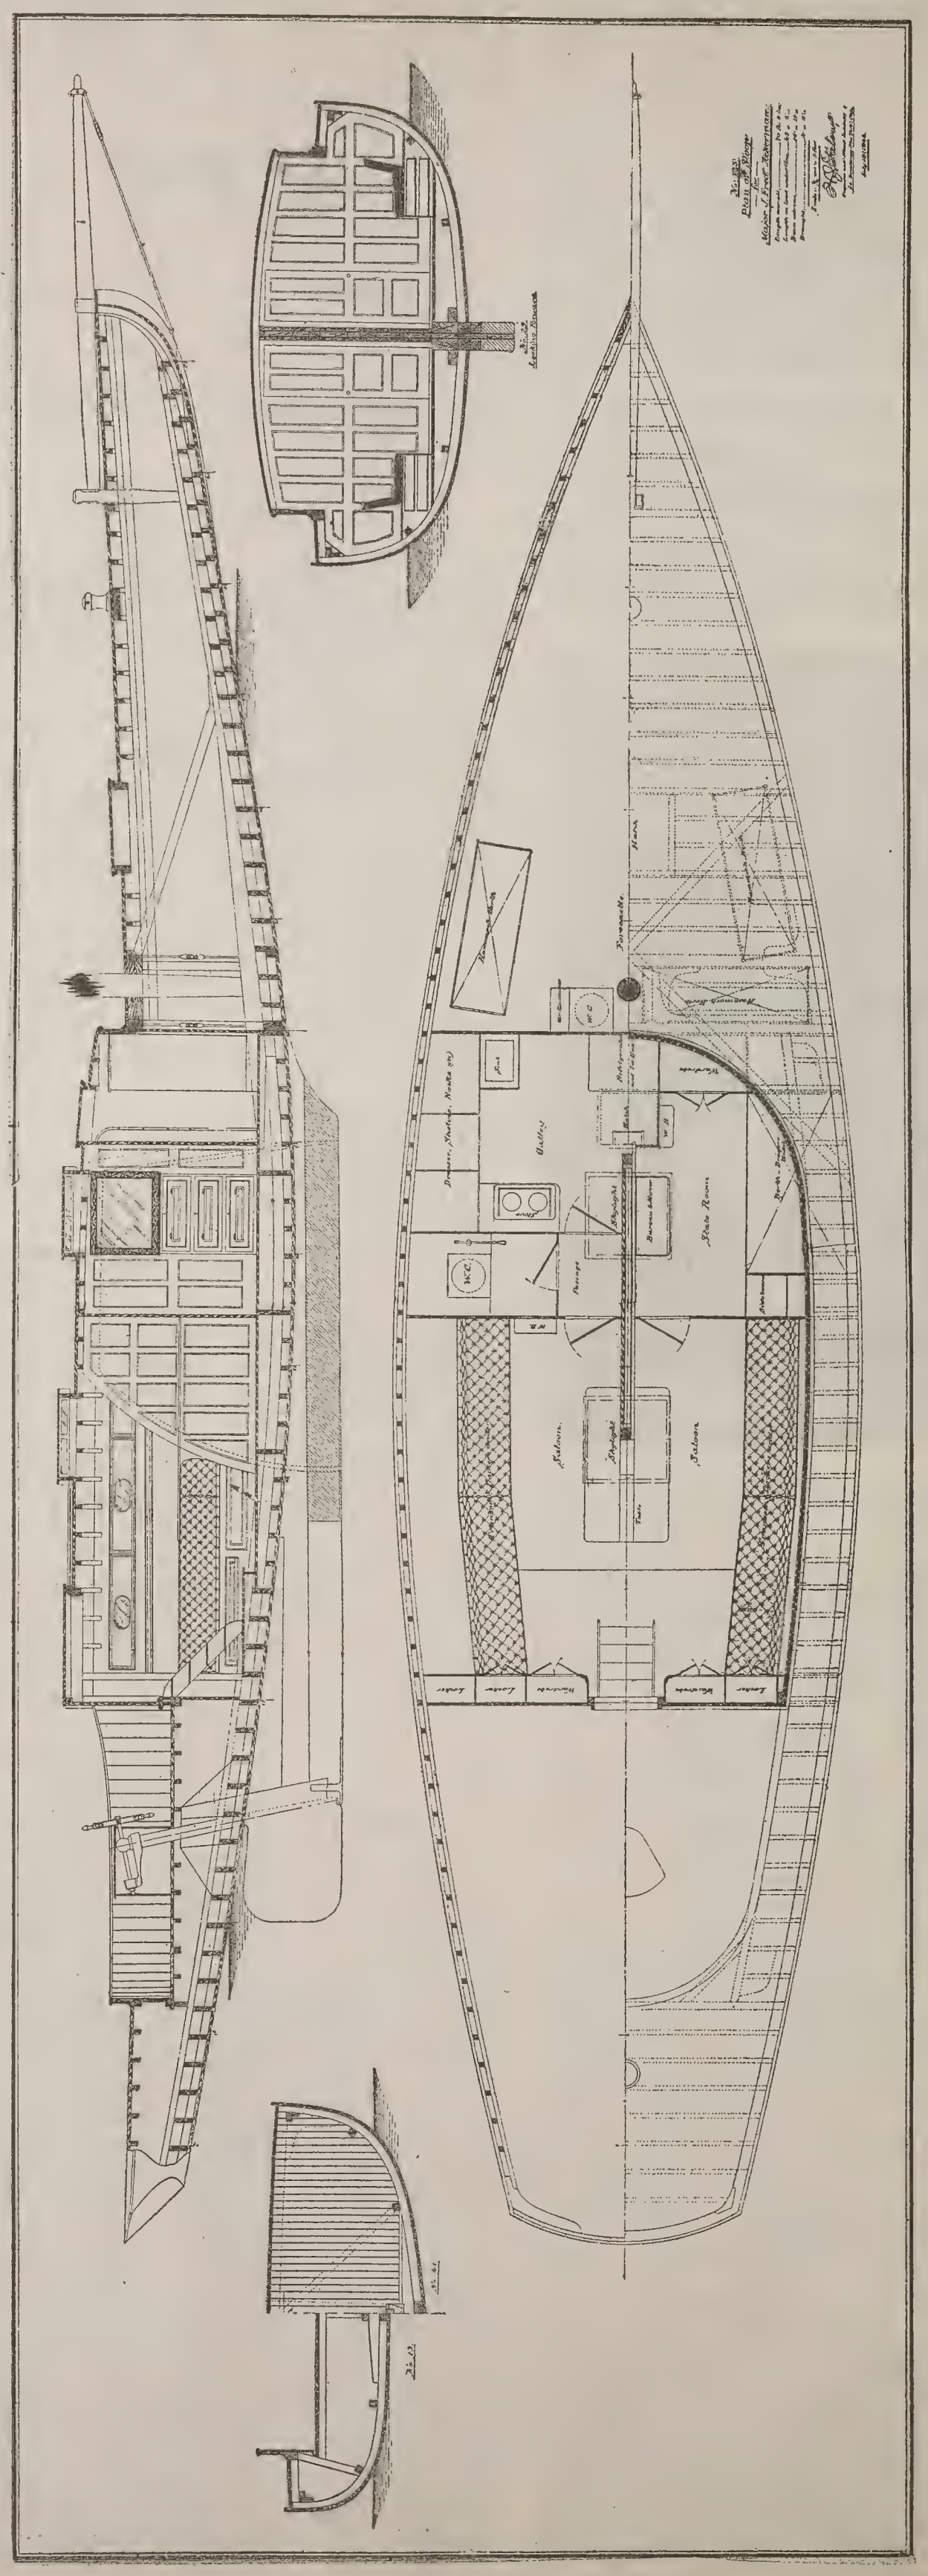
"No, you wasn't too long about it," rejoined Rogers.

"Well, then," said the vicar, "I hope I wasn't too short."

"No," answered Rogers, "nor yet too short, neither. You was just about right."

The vicar felt relieved, and said, "I'm glad of that, because, to tell you the truth, while I was writing that sermon my little dog got hold of four of the folios and destroyed them, and I was afraid it would be too short."

Rogers looked very thoughtful for a moment, and then very confidentially remarked: "Lor', now, did he? I suppose you wouldn't mine lettin' our vicar 'ome 'ere 'ave a pup o' your dog?"—Toronto Empire.



FORTY-FIVE-FOOT WATERLINE CRUISING SLOOP——CABIN PLANS——DESIGNED BY HENRY J. GIELOW FOR J. FRED ACKERMAN, ESQ.

FORTY-FIVE-FOOT WATERLINE CRUISING SLOOP——SAIL PLAN——DESIGNED BY HENRY J. GIELOW FOR J. FRED ACKERMAN, ESQ.

Yachting.

Shoal Draft and Cruising Sloop.

THROUGH the courtesy of Mr. Henry J. Gielow, we publish in this issue the sail and cabin plans of a 45ft. waterline cruising sloop.

The boat was designed by Mr. Gielow for Major Fred. J. Ackerman, and was built by Mr. William P. Kirk, of Tom's River, N. J. Mr. Kirk has done a remarkably fine job on the boat, and has employed the best workmanship and labor procurable in the construction. The design shows a boat with long and full ends, her shallow body has made it necessary to resort to a high cabin house to secure headroom below. As she has considerable power the sail area of 2,800 sq. ft. may be considered quite moderate. All the ballast is outside on the keel. The cabin house is 24ft. long and there is a waterway 1ft. 9in. wide all around the house and cockpit. Owing to the long forward overhang, very little bowsprit is needed, and it will project only 8ft. beyond the gammon iron. The dimensions are as follows:

Length—		
Over all	70ft.	0in.
L.W.L.	45ft.	2in.
Overhang—		
Forward	13ft.	4in.
Aft	11ft.	6in.
Breadth—		
Extreme	16ft.	11in.
L.W.L.	15ft.	4in.
Draft—		
Extreme	4ft.	0in.
To rabbet	2ft.	3in.
Board down	12ft.	0in.
Freeboard—		
Bow	5ft.	2in.
Least	3ft.	0in.
Stern	3ft.	9in.
Sail Area—		
Mainsail	2,070 sq. ft.	
Staysail	291 sq. ft.	
Jib	435 sq. ft.	
Total	2,796 sq. ft.	

The cockpit is watertight and the wheel box is about in the center of it. It is very roomy, being 10ft. 6in. long and 11ft. wide.

Below there is 6ft. 2in. headroom under the beams in the cabin house. The companionway leads directly into the main saloon, which is 14ft. long and extends the full width of the boat. The centerboard trunk runs into the main saloon for a short distance. There is 8ft. floor space between the transoms in the cabin and overhead is a skylight 3ft. square. On each side are transoms, the backs of which fold down, making very wide berths. During the day the bedding is stored behind. Lockers extend across the after bulkhead of the cabin. Under the skylight is an extension table.

On the starboard side forward is a large stateroom with a wide berth, a bureau, closets, etc. Opposite on the port side is the lavatory, with a patent closet, and forward of this is the galley, which is 7ft. long. The galley is unusually large for a boat of this size, and is conveniently fitted up.

The forecastle is cramped for headroom, there being only about 4ft. headroom. There are accommodations for three men.

The centerboard trunk is 11ft. 6in. long, and runs up to the underside of the top of the cabin house.

Long Island Sound Y. R. A.

AT a special meeting of the Yacht Racing Association of Long Island Sound, held at the Arena on Wednesday, Nov. 19, the important question of measurement rules for the coming season was acted upon and the rule of last season was, with some modifications, again adopted. An effort was made to have the Association adopt the new N. Y. Y. C. measurement rule, but as some of the Sound clubs refused to consider this rule, it was decided that in the interest of harmony and good racing it would be the best policy for the Association to stick to its rule of 1902. The rule as adopted is as follows:

MEASUREMENT.

Yachts shall be rated for classification and time allowance by racing measurement, which shall be determined by adding to half the load waterline, half the square root of sail area and a quantity expressed as P, and by dividing the sum of these quantities by 1.1.

$$\frac{\frac{1}{2}\,LWL + \frac{1}{2}\sqrt{SA} + P}{1.1} = RL$$

The quantity P is to be obtained in the following way:

B is breadth of load waterline plane at ⅛ of its length from fore end.

B′ is breadth of load waterline plane at ⅛ of its length from after end.

B″ is breadth (greatest) of LW plane.

E is any excess of (B + B′) over B″.

D is draft at MS + ⅜ of any greater draft aft, and all of any greater draft forward.

C is the maximum limit of the class.

$F = 4.05 - (C \times .008)$.

A = any excess of (B″ + D) over $F\sqrt{MS}$ submerged.

E + A = P.

From this it will be seen that the change is in the method of obtaining the quantity P which corresponds with the L of the original formula. As it is now, instead of multiplying the square root of the midship section by 3⅓ for all classes, the multiplier is found by the formula 4.05 — (C × .008), C being the maximum limit of the class in which the yacht sails. This figures out so that the multiplier for the 90ft. class of sloops is 3.33, as in the original formula, but as the classes go down the multiplier increases, so that for the 18ft. class it is 3.91, which allows for a proportionally smaller area of midship section in the smaller classes without so heavy a penalty for the excess of beam plus draft over the measurement of midship section. In the measurement for sail area the entire masthead is figured instead of 80 per cent., as formerly, and on hanging the peak halyard block the restriction has been made that it shall not be carried on a pennant. This is done to prevent an evasion of the rule, which was found in one or two instances last season.

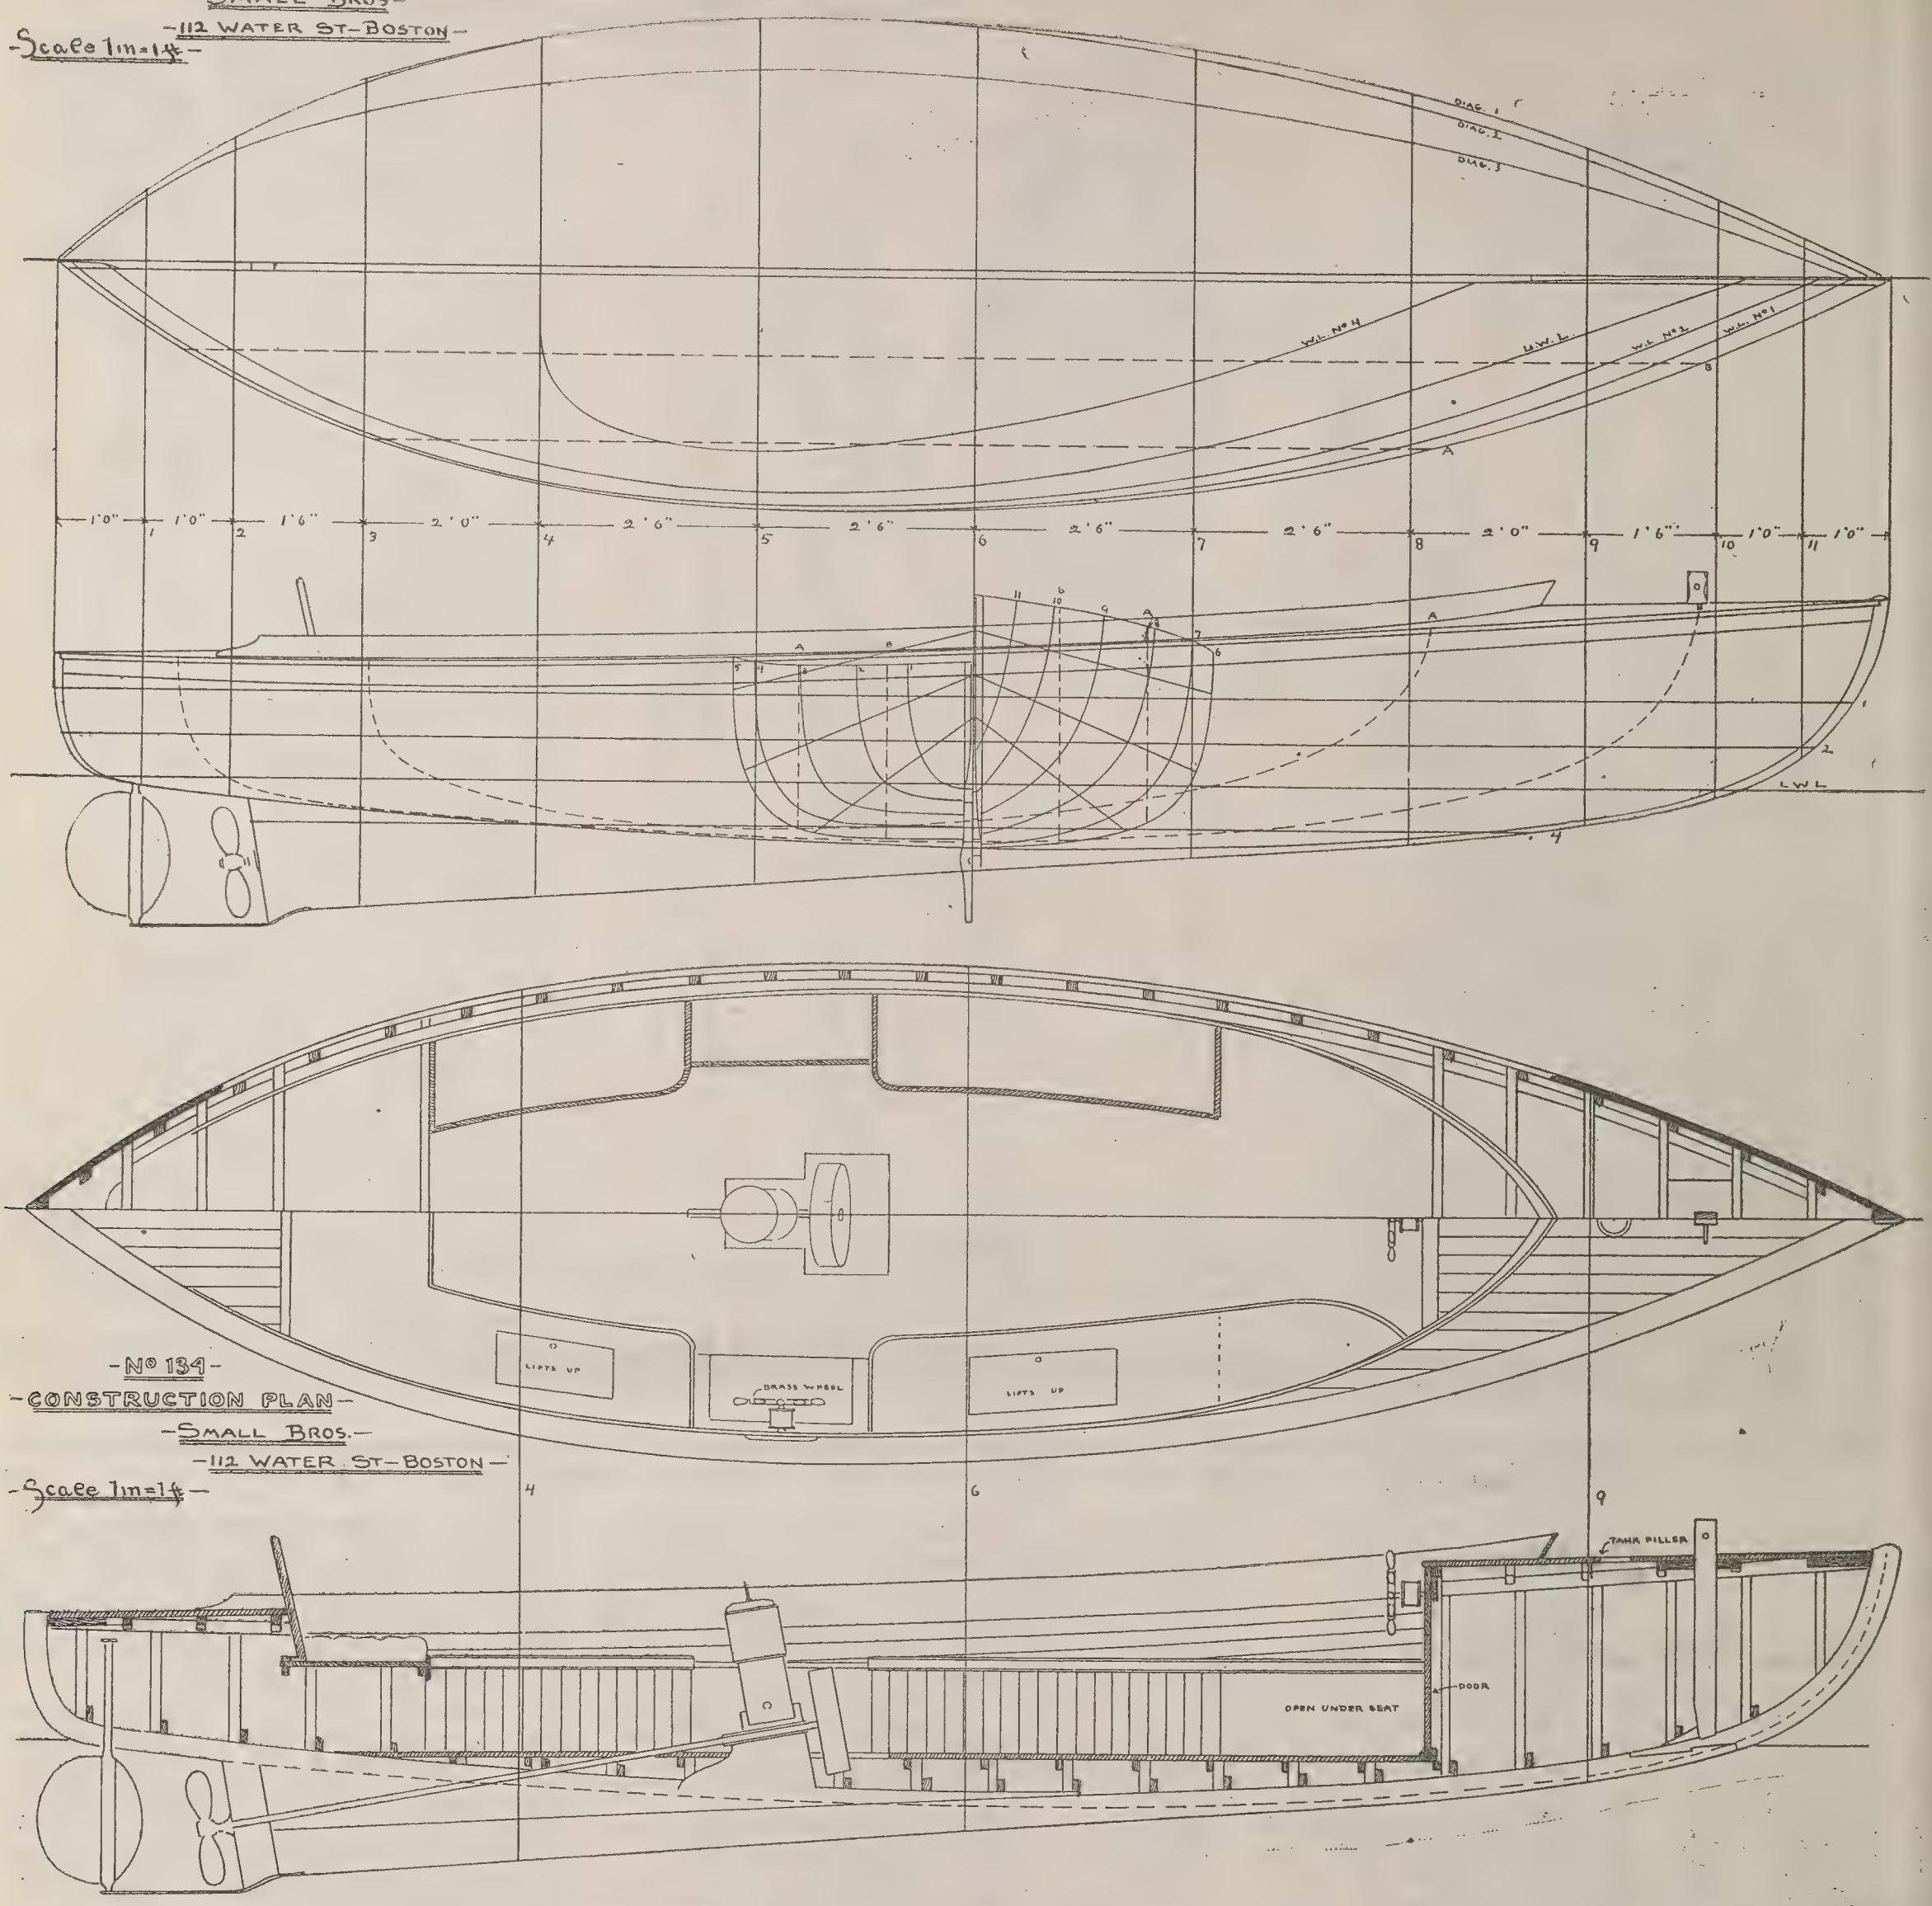
In the requirements for cabin accommodations, the length of cabin floor over which the necessary headroom is required was reduced to 6ft. in the 25ft. class, 8ft. in the 30ft., and 12ft. in the 36ft. class.

In the general rules regarding the management of the Association's affairs, another change has been made, and now instead of an executive committee with a chairman at its head the Association will elect at its March meeting a president, secretary and treasurer who, with four other members shall comprise the executive committee and govern the Association's affairs. This definitely settles the racing rules for the Sound for next year, so far as the Association is concerned, and as there is every probability that the Larchmont club will modify its rules to conform with those of the Association, there will be a uniformity to the rules which should help to develop good racing.

The handsome auxiliary Intrepid, has recently been sold by Mr. Lloyd Phœnix, N. Y. Y. C., to Mr. Henry R. Wolcott, of the same club. Intrepid was designed by Mr. J. Beavor Webb and built by the Neafie & Levy Shipbuilding Company, of Philadelphia, in 1892. She is 163ft. 6in. over all, 132ft. on the waterline, 27ft. 2in. beam and 13ft. 6in. draft.

Mr. Phœnix has commissioned J. Beavor Webb to design a new yacht of the same general dimensions and type to take the place of Intrepid, which will not be turned over to her owner until the new boat is finished.

For the defense of the Canada Cup in next season's match between the Royal Canadian and the Rochester Y. C.s, Mr. Norman Macree, of Toronto, has ordered a boat from Arthur E. Payne, of Southampton, England, which will be built in Canada by Capt. Andrews, of Oakville.



TWENTY-ONE-FOOT OPEN LAUNCH——DESIGNED BY SMALL BROS.

Long Island Sound Champions.

The championship winners for the Long Island Sound Y. R. A. races of last season have just been announced, and while the records may be slightly changed with the decisions on some protests which have not yet been settled, it is not likely that there will be any change in the class champions, which are as follows:

43ft. Class—Effort, F. M. Smith, owner.
36ft. Class—Leda, Harry Maxwell, owner.
30ft. Class—Mimosa, T. L. Park, owner.
21ft. Class—Gazaboo, H. C. Vulte, owner.
18ft. Class—Cricket, Harold Pryor, owner.
Raceabout Class—Whistlewing, H. M. Crane, owner.
Larchmont 21ft. Class—Adelaide, J. J. Dwyer, owner.
Manhasset one-design—Bob, J. M. Hoyt, owner.
New Rochelle one-design—Knave, R. U. Bavier, owner.

These championships are announced subject to correction on the receipt of official reports from two important clubs. These reports are withheld for the time being, because certain protest cases have not yet been decided. To qualify for championship a yacht must sail on at least one-half the racing days on which championship races are indicated in the association schedule. In every race a yacht is credited with a point for every yacht she defeats, and one additional point as a premium for completing the race. At the end of the season the number of points to a yacht's credit is ascertained and the per cent. which this number is of the number she would have had if she had won every race in which she started, is her championship record.

Effort was the only yacht to qualify in the 43ft. class, sailing in twelve of the sixteen races given and scoring first place in five races, second in two races, third in one race and two sail overs. She has 20 points out of a possible 26 and a percentage of 77.

In the 36ft. class Leda won seven of the ten races in which she sailed, scoring 26 points out of a possible 29 and having a percentage of 89.6. Spasm, E. L. King; Empress, G. M. Heckscher and Possum, E. S. Ballou, also qualified. The racing in the 30ft. class was very close between Mimosa, Alerion and Marguerite, all of which qualified. Mimosa won 8 of the 16 races she sailed, getting 47 points out of a possible 57, and a percentage of 82.4. Alerion's percentage was 72.4 and Marguerite's 70.6.

In the 21ft. class of sloops H. G. Vulte's Gazaboo was the only one to qualify. She sailed in 13 races, made 23 points out of a possible 45, and her percentage was 51. In the 18ft. sloop class, Cricket, owned by Harold Pryor, son of ex-Commodore Pryor, of the New Rochelle Y. C., was alone in qualifying. She sailed in 13 races and made 24 points out of a possible thirty-seven. Her percentage was 65.

In the 25ft. sloop class, the 43 and 36ft. yawl classes, and the several catboat classes no yachts qualified for championships. The hottest contest of all was in the raceabout class. There were 18 race days. J. T. Pirie's Scamp sailed on 13, Gordon Pirie's Mavis on 17, T. B. Bleecker's Jolly Roger on 12, and A. Bryan Alley's Snapper, H. M. Crane's Whistlewing, and Trenor L. Park's Hobo on 9 each. The record, as it stands at present, shows Whistlewing to be champion, with a record of 51 points out of a possible 58 and a percentage of 87.9. The official returns, now lacking, may make something of a change in this resord, however. Scamp's percentage was 38.5, that of Mavis 64.1, Jolly Roger's 67.1, Snapper's 41.7, and Hobo's 52. In the Larchmont 21ft. one-design class J. J. Dwyer's Adelaide won the championship, with a score of 13 points out of a possible 15 and a percentage of 87, against 10 points out of 17 and a percentage of 59 for J. H. Esser's Houri. Bab, owned by John R. Hoyt, is champion of the Manhasset Bay one-design class. She made 26 points out of a possible 29 and a percentage of 89.7. Her nearest competitor was Commodore Stephen W. Roach's Lambkin, which has a record of 26 points out of 33 and a percentage of 79. In the New Rochelle one-design class, R. U. Bavier's Knave is the champion. She sailed in every race given for her class—eleven in all—won ten of them, and finished second in the eleventh, having been defeated in that race by Ace, owned by Mr. Bavier's younger brother. Knave's record is 38 points out of 39 and a percentage of 97.4. Ace and P. L. Howard's Caper also sailed in every race, and made 22 and 18 points, respectively, in a possible 39.

About 160 yachts competed in some degree in the championship contests in the several classes, but only 25 yachts qualified in all.

21-Foot Open Launch.

We are able to publish this week, through the kindness of Messrs. Small Brothers, of Boston, the plans of a 21ft. over all launch, designed by them for Mr. Edward Stanwood, of Boston, who will use her on the Maine coast. The boat will be propelled by a three horse-power Lozier motor. The boat's dimensions follow:

Length—	
Over all	21ft. 0in.
L.W.L.	18ft. 9in.
Overhang—	
Forward	1ft. 9in.
Aft	0ft. 6in.
Breadth—	
Extreme	5ft. 6in.
L.W.L.	5ft. 0in.
Draft—	
To rabbet	0ft. 9in.
Extreme	1ft. 6in.

A START IN THE FORTY-THREE-FOOT CLASS——EFFORT AND DORWINA.
Photo by James Burton, New York.

Society of Naval Architects and Marine Engineers.

THE tenth annual meeting of the Society of Naval Architects and Marine Engineers was held in the auditorium of the American Society of Mechanical Engineers at 12 West Thirty-first street, on Thursday, Nov. 20. The annual election resulted in the re-election of Mr. Clement A. Griscom, who has now held the office of president for ten years. The following papers were read during the day's session:

"Technical Training for Shipbuilders," by Henry S. Pritchett, LL. D.; "Progressive Trials of the Screw Ferryboat Edgewater," by Edwin A. Stevens, vice-president, and Charles P. Paulding, Jr.; "The Possible and Probable Developments in the Use of Electricity on Board Ships," by F. O. Blackwell; "The Preliminary Official Trial of the U. S. Battleship Maine," by Assistant Naval Constructor J. W. Powell, U. S. N., associate; "The Water Tube Boiler in the American Mercantile Marine," by William A. Fairburn; "Longitudinal Bending Stress on Damaged Ships," by George C. Cook; "Some Problems on the Surfaces of Buoyancy and of Water Lines;" by Prof. Cecil H. Peabody.

The paper on water tube boilers by Mr. William A. Fairburn contained interesting references to the use of oil as fuel in steamships. The paper says: "At the present time liquid fuel is being used on several ocean going merchant vessels, and the leading navies of the world are diligently experimenting with it."

Mr. Fairburn enumerates among the advantages of oil fuel:

Saving in weight of fuel and also in bunker space.

Two tons of oil have an evaporative efficiency equivalent to three tons of coal.

Saving in labor—the number of men required being only about one-fourth of the number required with coal fuel.

Ease in taking fuel on board.

No lost space in storage.

Cleanliness.

Speed in filling tanks with fuel. Saving of detention at calling ports.

Fires do not require cleaning.

No ashes to handle.

Reduced temperature of firerooms.

Increased life of boilers, due to constant temperature.

Improved engine performance, owing to constant steam pressure.

Fires always clean and in good condition, which materially increases the average working power of the boiler. With coal fires the power drops as the fire gets dirty, and it drops still more when the fires are being cleaned.

When atomizers are properly regulated the combustion can be made complete and there is no smoke.

In conclusion, Mr. Fairburn says that oil is destined to supplant coal as steam making fuel on the seas.

One of the most interesting papers was that of Naval Constructor Powell on The Preliminary Official Trial of the U. S. Battleship Maine.

Constructor Powell described the trip and said:

"In the fore and main, both lower and upper, tops only a very moderate amount of practically constant vertical vibration was noted, and the same was true of both the forward and after bridges. Throughout the waist of the ship the vibration was hardly noticeable. The vibration at seventeen knots was slightly more marked than that at eighteen knots."

Of the reversing test of the engines he said:

"This consisted of stopping and reversing the engines as quickly as possible, starting with engines going ahead at full speed and noting the time until each stopped, until each started astern and until each was making full speed astern. The time required to pass from full speed astern to full speed ahead was then noted.

From full speed to stop took 9s. with both port and starboard engines; from stop to astern, 5s. with starboard engine, 6 with port; from stop to full speed astern, 60s. with starboard engine, 55 with port; from full speed astern to ahead, 5s. with both engines.

The meeting was continued on Friday, Nov. 21, and papers were read on the following subjects: "The Tactics of the Gun," by Lieut.-Commander A. P. Niblack; "Submarine Torpedo Boats; Past, Present and Future," a paper by Lawrence Y. Spear; "Vibration of Steamships; With Special References to Those of the Second and Higher Periods," by Rear Admiral George W. Melville; "The Development of Modern Ordnance and Armor in the United States," by Rear Admiral Charles O'Neill; "Remarks on the New Designs for Naval Vessels," by Rear Admiral Francis T. Bowles; "The Possible and Probable Future Developments in the Use of Electricity on Board Ships," by F. O. Blackwell; "Measurement Rules for Yachts, with Special Reference to Racing Conditions," by F. W. Belknap.

After the reading of these papers had been finished the meeting of the Society was adjourned, and in the evening the tenth annual banquet was held at Delmonico's.

Those at the large circular guest table included Messrs. A. K. McClure, P. A. B. Widener, J. J. Hill, Myron T. Herrick, A. A. Raven, S. A. Huhn, C. H. Haswell, Frederick M. Storm, C. M. Goldfogle, Edwin Cramp, J. F. Hanscom and Rear Admirals P. C. Asserson, A. C. Engard and Francis T. Bowles, Captain J. A. B. Smith, Clement A. Griscom, Frank L. Fernald, Charles Loring, Lewis Nixon, John C. Kafer, Edwin A. Stevens, W. Wing Babcock, Washington L. Capps, Wm. H. Jacques, Frank B. Ring, Henry G. Morse, Horace See, George E. Weed and others.

One hundred and sixty persons were present, and Mr. Griscom acted as toastmaster. The speeches were informal.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Dorwina and Effort.

THROUGHOUT the past season on the Sound, Dorwina and Effort, of the 43ft. class, were raced very persistently, and their performance was followed with considerable interest.

Dorwina is a Gardner boat built by Wood at City Island, in 1901. She is now owned by Mr. Clifford V. Brokaw, N. Y. Y. C. Her dimensions are 60ft. 1in. over all, 35ft. waterline, 12ft. extreme beam, 9ft. draft.

Effort was designed and built by the Herreshoff Mfg. Co., and is owned by Mr. F. M. Smith. She is 58ft. over all, 36ft. 6in. waterline, 11ft. 2in. beam, and 8ft. 10in. draft. In our illustration the boat on the right, L 3, is Dorwina, with Effort, L 10, out to weather.

YACHTING NEWS NOTES.

IT is reported that the actual work on the new cup defender will commence very soon at the Herreshoff works, as the mould for the keel is ready and the lead will be run in a few days. It is hoped to have the boat ready for launching by the first week of April, which will give over three months for tuning up trials.

From across the water comes the report that Shamrock III. has begun to take form in the Dumbarton yards of Messrs. Denney & Co., and that a few persons have been privileged to see her. It is said that Fife has gone in for an easier form and a smaller wetted surface than in the first Shamrock, and that the draft has been carried to the extreme of 26ft. 6in.

Next season the yachtsmen of Milwaukee will make an attempt to capture the Lipton Cup, which is now in the possession of the Columbia Y. C. of Chicago. One of the boats which will compete is the Massachusetts 21-footer Pilot, which has been recently sold by Mr. Reginald Bordman, of Boston, to Mr. R. B. Brown, of Milwaukee, through the agency of Hollis Burgess.

The schooner of 90 tons, built last year by the Hanley Construction Company, at Quincy, Mass., and never put in commission, has been purchased by Boston parties, and will be converted into a fisherman. She will be in charge of Capt. Doughty.

Capt. Christopher S. Crosby, one of the best-known yacht commanders in this country, died recently at his home in Philadelphia, aged sixty-eight years. He was born in Eastport, Me., and went to sea when young, but abandoned deep sea sailing for yachting some years ago. His best-known achievement was in command of the Coronet in his famous ocean race from New York to Queenstown in 1887 against the Dauntless. Capt. Crosby was a prominent member of the Masonic Order.

Boston Letter.

BOSTON, Nov. 24.—In spite of the fact that the organizers of the new 22ft. class have declared their intentions of going ahead and building, and have called upon those interested to help out in the work, there has not been such a complimentary showing as was at first supposed. It was understood that Burgess and Lawley each had three orders for boats for the class, but it has developed that such is not exactly the case. With one exception these orders were entirely provisional. One boat, for Sumner H. Foster, has beeen ordered from Burgess. Another of Burgess' clients has decided to build in the 18ft. knockabout class, while the third is still undecided about going into the class. Lawley has three provisional orders for 22-footers, but has not been commissioned to go ahead with any of them. One of these boats is for a South Shore yachtsman who has been very active in the organization of the class, and it is thought that he will build. In that case definite orders for the other two boats may follow.

There is no doubt that the refusal of the Yacht Racing Association of Massachusetts is responsible for the uncertainty in the minds of some of the yachtsmen who would have otherwise built for it. This is another instance of the moral effect of the attitude of the Association upon matters pertaining to yacht racing. As in all new features, this class has come in the line of an experiment. This in itself would tend to cause uncertainty in the minds of any but the most fearless yachtsmen or those with unlimited means. It is now believed by the organizers of the class that it will be adopted at the spring meeting of the Association, but there is sure to be a warm contest over the question.

Yachts for the Y. R. A. restricted classes are still limited to three, with the exception of the 18ft. knockabout class. This class, while adopted by the Association, is really under control of an association of the same name. The three new boats are for the 25ft. class, and it is needless to say that they are extreme. Up to date there has not been one new 21-footer heard from. As this was the star class last season, it would seem that there must be some strong reason for the falling off in interest. Still, there are yachtsmen who will say that existing rules are all right and should be maintained, but the present conditions do not seem to indicate any great degree of confidence in this belief.

The refusal to entertain changes in the rules was probably in the same spirit in which anything new is received by the Association's delegates. It is very hard to get them to adopt any changes, and, no matter how much the form of the proposed new measurement rule may be modified, it is likely that there will be much opposition to its passage if it is again proposed. The unsettled condition of affairs at present is not doing the Association any good, nor is it of any benefit to the sport. Those of the delegates who voted against the change in measurement rule as a result of any thought, took the attitude that was taken by some of the delegates of the Long Island Sound Yacht Racing Association that, while the rule would work out all right in the larger classes, it would not be a good one for yachts of 30ft. and under. Those who wanted the changes are not quite so certain of this distinction.

The latest rumor in Boston is to the effect that Hanley has plans for a centerboard 90-footer and that he has good prospects of forming a syndicate for her construction. With the knowledge of the centerboard 90-footer that was surely to be built in 1901 in mind, I am very much averse to the belief that any such boat will be built. There are many yachtsmen who believe that an out-and-out centerboard 90-footer would be in the running with any of the keel boats, and not a few who believe that such a boat would prove superior. Boston yachtsmen would thoroughly like to see the East represented in the trial races and with the representative centerboard boat, but there are few indeed who would invest any cold cash in the venture. In Boston, like other cities, there are probably a number of naval architects who have more or less definite plans of 90-footers which they would like to build if somebody would produce the money.

At Lawley's the Hart cruising 30-footer is about completed, and will probably be hauled out of the shop in a few days. A 30ft. ketch for J. H. Cromwell is nearly all planked, and the deck is being laid. J. H. Protor's launch is finished. The frames are out for C. H. Clark's 60ft. schooner. Keel and frames have been turned out for the 34ft. yawl for F. H. Adriance. C. A. Fletcher's 166ft. steamer is about one-third plated. A 50ft. schooner for Major L. S. Bent, of Philadelphia, is being laid down.

Frank N. Tandy has added a drafting department to his brokerage office. He has associated with him J. R. Daniell, formerly with Crowninshield, and is prepared to take orders for the designs of yachts.

Hollis Burgess has sold the 45ft. gasolene launch Haidee, owned by Mr. W. F. Beal, to Mr. A. P. Loring. Haidee was designed by Crowninshield and built this year by Roger Eccles, of Beverly. She is of the torpedo boat style and is supplied with two dummy funnels.

JOHN B. KILLEEN.

High Speed Yacht for Mr. Gould.

MR. HOWARD GOULD, N. Y. Y. C., has ordered a steam yacht which he intends to name the Niagara IV. This new boat is designed to take the place of the Niagara III., which he recently sold to his brother, Edwin Gould, and will be used in service on the Sound, between Mr. Gould's country estate at Port Washington, L. I., and New York city.

The Niagara IV. is from the plans of Mr. Chas. L. Seabury, and will be built by the Gas Engine and Power Co. and Chas. L. Seabury & Co., at Morris Heights, on the Harlem. The yacht will be of the high-speed type, and her guaranteed speed will be twenty-three miles per hour; this practically means twenty-five miles, as the contract speed will undoubtedly be exceeded, and she will be the fastest vessel of her type in service. The yacht will be of steel and wood, double planked, with twin screws and two smoke stacks. The general dimensions are: Length over all, 110ft.; beam, 12ft.; draft, 4½ft. She will be fitted with triple expansion engines and Seabury water tube boilers of latest design. The contract calls for delivery on April 1, and the builders propose to have her finished and the final speed trials made before that time. As far as practicable the general design of the Niagara III. has been followed in the new model. There will be a commodious forward deck house, which is to be used as breakfast room. Mr. Gould's quarters will be aft, very roomy, handsomely furnished and comfortably finished. It is intended that the decorations shall be of the finest quality with unnecessary display. There will be a bath and toilet rooms, wardrobe and a large saloon, which may be used as a stateroom if necessary. Aft of the saloon will be a commodious cockpit, with easy chairs, and abaft of this a roomy deck. Seven men will be carried. The Niagara IV. when running at full speed is likely to present a very interesting appearance.

New York Y. C. Measurement Rule.

NEW YORK, Nov. 20.—*Editor Forest and Stream:* The measurement rule of the New York Y. C. is of interest to yachtsmen in general, due to the fact that a universal measurement rule is very desirable, and of interest to designers and owners of yachts because they must design and build under it, I therefore offer the following discussion as of great interest at the present time: The racing rule is

$$\text{Racing measurement} = \frac{L \times \sqrt{S.A.}}{5\sqrt[3]{D}}$$

$\sqrt{S.A.}$ may not exceed 1.35 L.

It may be admitted that every designer will take the maximum of sail area so that the formula may be rewritten as follows:

$$\text{Racing measurement} = \frac{L \times 1.35\,L}{5\sqrt[3]{D}} \text{ or } \frac{0.27\,L^2}{5\sqrt[3]{D}}$$

If we apply this formula to Class J, in which the limits are between 40 and 51ft. racing measurement, we find that the sail area and displacement may range between the limits of 6,000 pounds with 1,225 sq. ft. up to 90,000 pounds with 3,850 sq. ft. Assuming that the designer would wish to build up to the top limit of the class, that is 51ft. racing length, he may take any combination between 15,000 pounds displacement with 2,130 square feet of sail, and 90,000 pounds displacement with 3,850 sq. ft. of sail.

Heretofore the endeavor has been to eliminate time allowance and to foster racing between boats of practically the same size. It is said that the rule favors a large displacement boat—evidently from the above the exact converse is true.

Will not some of the gentlemen who have expressed themselves in favor of this rule show how it meets these objections?

GEO. HILL.

YACHT CLUB NOTES.

The annual meeting of the Manhasset Bay Y. C. will be held at the Hotel Manhattan on Tuesday, Dec. 2, for the election of officers for the ensuing year, and for action on amendments to the Constitution and By-Laws. The regular ticket to be voted on is as follows: Com., Alphonse H. Alker, steamer Florence; Vice-Com., Charles W. Lee (building); Rear-Com., H. Winslow White, sloop Coya; Sec'y, Edward M. MacLellan; Treas., Guy W. Buxton; Meas., Charles D. Mower; Trustees (class of 1905), James R. Thomson, Hazen L. Hoyt. After the meeting the annual dinner will be served and the prizes won in races given by the club during the past season will be presented to the winning owners. The Manhasset Bay challenge cup will be on exhibition during the evening.

* * *

At the Seawanhaka-Corinthian Y. C.s' quarters in Forty-fourth street on Thursday, Nov. 20, Capt. Howard Patterson delivered an interesting lecture on "Charts and Chart Sailing as Applied to Domestic Navigation."

The California Y. C. is preparing plans for a new club house, and expects to be in its new quarters at the opening of next season.

Rifle Range and Gallery.

A Nation of Marksmen.

Editor Forest and Stream:

In the days of Agincourt and Cressy those victories were the fruit of the marksmanship of the English bowmen. The archer with his long yew bow and cloth yard shaft made the English army what it was—invincible.

The French had good reason when singing their litany in church to include in same, "From the arrows of the English may the good Lord deliver us."

History is repeating itself once more, and the battles of the future upon land will be won by the men behind the rifles. Close formation and point blank volleys are things of the past. Smokeless powder and long distance rifles become of no immediate practical value in the hands of the inexperienced soldier.

The English grew into the use of the long bow as did our Minute Men and Green Mountain Boys grow into the use of the rifle, but under differing surroundings. The English boy was at an early age through the stimulus of prizes, encouraged to shoot with the bow at a mark erected on the village green. Days of merry-making always included the sport of archery upon the programme, and even was the practice at archery made compulsory by law.

Our forefathers virtually plowed with one hand and held a rifle with the other. The seal of Minnesota shows a husbandman at the plow, his rifle and powder-horn upon a nearby stump and a skulking redskin in the distance. It was force of circumstances that made marksmen of our forefathers, defense against the Indians and wild beasts, and the necessity of supplying the larder from the forests. During our Civil War, soldier for soldier, we had no such marksmen in the ranks as in the Revolutionary War. Times had changed, men were recruited from the city and the workshop, and not as of yore, from the frontier, where stood a rifle ready for instant use behind each door.

The late Boer war was an illustration of pitting men unused to a rifle against those who understood the arm and were as familiar with it as a schoolboy with his jackknife.

Now, as a general rule, a few days' hard drilling will turn an awkward squad into some semblance to a military company in carriage and step, but it means months of incessant labor to make marksmen of those unfamiliar with the rifle.

Compulsory practice with the rifle has been successfully carried out in Switzerland, but it would not apply to the United States. The love of the rifle must be brought about in some other way.

Now, as a suggestion. Make a reward sufficiently inviting and there are those who will strive for it. Let us suppose that a yearly distribution of, say, $100,000, were made in prizes; $50,000 to the marksman of the year; $25,000 to the second best; $15,000 to the third, and $1,000 to the next ten in rank. Whether the amount of $100,000 per year was made up out of the United States treasury or came from other sources, makes no difference. The question is, what would the effect be upon the country after ten consecutive years of such prize offering?

I think every village in the country would have its rifle range, and few of the youths who could give the time to practice but would become applicants and contestants for the prize.

The primary contests would be shot at the home villages or cities. The winners would in turn contest among themselves within a certain district, and the successful one in each district be delegated to the final contest, to be held at some central point. Here, under conditions that could admit of no charge of partiality, would the final contest be held. Targets at fixed and unknown distances, moving objects, etc., would call into practice the very highest skill of the marksmen. The prizes would certainly be more tempting than a marksman's badge or a silver cup. In these days of $1,000,000 salaries and "melon-cutting" dividends in Wall street, perhaps a $50,000 prize might not tempt some of our gilded youth to forego the golf stick and the tennis racquet for the rifle. Yet, when you come to think of it, there are those who, with perhaps a little truck farming to help out, might worry along peacefully with a prize of $50,000 in cold cash to their credit in the bank. So the grand prize of $50,000 with the great majority of young men might be considered a tempting prize, enough so to warrant an investment in a rifle and ammunition and the giving over of a part of Saturday to the weekly practice.

There is many a "hundred thousand" that goes to make up the quota of a "billion-dollar Congress" that is spent for purposes far less meritorious than prizes for rifle proficiency among the youth of the country.

What would be the effect of a plan of this kind being carried out after say, ten or fifteen years? That's the question. We hear of Peace Congresses, International Arbitration, Total disarmament, etc., etc., but we see no diminution of the standing armies and navies of the world. Improvements in war materials go on. We no sooner improve the unpenetrability of armor than some new shell is perfected with superior penetrating powers, and so the race goes on. Guns that carried 12 miles now carry 21. Not content with fighting above the water, the sea warfare of the future seems destined to be fought out beneath the waves. Rifles of greater penetration and carrying power are being successfully put forward. All this would seem to prove that for some years to come the theory will be held that the one best equipped on a war footing in time of peace will be virtually guaranteed from neighborly interference. And if all this be so, this country must keep abreast with the times. Her ships must be second to none, and while our standing army need be kept to a minimum, yet like the Spartans, every man in the Republic should be a brick, he should become expert in the use of a rifle, and if the time ever came when his country needed him, he could step into the ranks a soldier requiring but a minimum of preliminary drilling to bring him to a plane of soldierly perfection.

CHARLES CRISTADORO.

Rifle at Ossining.

OSSINING, N. Y., Nov. 24.—During the week ending Nov. 15 the following scores were made at the rifle gallery of the Ossining Gun Club; distance 50ft.; ¼in. 25-ring target; 10 shots: Geo. N. Tompkins 226, 236, 229; Wm. Wheeler 224; C. G. Blandford 233, 231, 219, 240, 228, 233, 230, 238; A. S. Harvey 189; Amos Bedell 231, 232; Wm. Fisher 221; Wm. Coleman 222, 224, 224, 230; J. Hyland 228, 219, 226; Geo. Edgers 187; J. A. Stevenson 217; C. H. Sidman 228, 227; Dr. E. B. Sherwood 235; W. H. Smith 208.

Pistol scores, 10 shots, 50ft., same target: J. A. Stevenson 82, C. H. Sidman 142, E. F. Ball 213.

Matches: D. Brandreth 224 vs. C. G. Blandford 219. C. G. Blandford 232, vs. D. Brandreth 227. C. G. Blandford 231, vs. D. Brandreth 230. C. G. Blandford 239, vs. Wm. Coleman 231. Wm. Coleman 234, vs. C. G. Blandford 230.

The scores for week ending Nov. 22 were as follows: G. Palmer 171; Miss Frances Gibson 218; C. G. Blandford 234, 233; T. Wyants 236, 232; Wm. Coleman 229; Warren Thompson 219; I. M. Sheldon 230; D. Brandreth 235, 237; Dr. E. B. Sherwood 227, 230, 232; I. T. Washburn 231, 236; J. Hyland 232; A. E. Kriegsman 206.

A series of matches between D. Brandreth and C. G. Blandford resulted in a victory for the former.

The following are high in the re-entry cup match, closing Thanksgiving Day:

Members: D. Brandreth 240, Amos Bedell 237, I. T. Washburn 236.

Non-members: Geo. N. Tompkins 239, C. H. Sidman 239; F. Tompkins 236, J. Hyland 232.

Ladies: Mrs. E. F. Ball 236, Miss Frances Gibson 222.

Cadets: E. H. Sherwood 229, R. Stancliff 218, A. E. Kriegsmann 206.

E. F. B.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Fourth Tuesday of each month, Hell Gate Gun Club's shoot at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Second Friday of each month (January and July excepted), shoot of Hell Gate Annex, at Dexter Park, Brooklyn.

Saturdays, Brooklyn Gun Club's shoot, Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

Saturdays, Newark, N. J., South Side Gun Club's shoots, South Broad street, near Lehigh Valley coal depot.

Saturdays, Outwater's grounds, Carlstadt, N. J., live bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The open season this year seems to be one of exceptional interest to the devotees of the shotgun, if their absence from the traps is a true criterion by which to judge. About New York, excepting the light shoots held by the regular clubs, there is no activity in shooting matters. However, after the holiday season, there will be a revival of interest and action.

After a long trip through the western part of Canada, in which Capt. A. W. du Bray visited Edmonton, Calgary, Winnipeg and other leading cities of that great game region, he is now journeying homeward to Cincinnati. We fancy that Capt. du Bray could relate some shooting experiences incident to his trip which would be of public interest.

The annual meeting of the Interstate Association will be held on Dec. 11, and clubs which desire the good offices of that Association in the matter of a tournament should set forth their wishes in a letter to the manager, Mr. Elmer E. Shaner, who officially mentions the matter this week in our trap columns.

The third and decisive win of the Crescent Athletic Club's November cup was scored last Saturday by Mr. H. B. Vanderveer, at the club's shoot at Bay Ridge. This win was the third successive one for him this month.

Mr. A. W. Baldwin informs us that the Mountainside Gun Club, of West Orange, N. J., will hold an open prize shoot on the Valley Road grounds, on Thanksgiving Day at 1:30 P. M. Turkeys and other prizes will be offered in the various events.

The offices of the Hazard Powder Co., in New York, were removed on Nov. 22 to the Engineering Building, 114-118 Liberty street. The Eastern agents are Messrs. John L. Lequin and E. S. Lentilhon.

There is a team race fixed to take place on Tuesday of this week between Cincinnati and Mechanicsburg (Ohio) teams, at the latter city, for the Phellis trophy.

The Passing of Authorities.

In a recent issue we published some extracts from "Hawker on Shooting," the title page of which bears the date of 1838. Lieut.-Col. P. Hawker was a marvel of an authority in his day, the strongest point to sustain him being the force of his conviction. We have received so many communications expressing interest on this subject that we feel sure some more extracts from the writings of the redoubtable Peter Hawker would have more than a passing interest.

The following excerpts are taken from his work aforementioned, and however erroneous they may be concerning ballistics, they are very sound as to the matter of the dangers of careless gun handling, as follows:

I shall leave the following directions, as they originally stood, for flint guns, repeating my observation that with detonators the young sportsman has only to make half the allowance at crossing objects, etc.

Let every one who begins shooting take warning from the many serious misfortunes that have, alas! too often occurred, and start with the determination of never suffering a gun at any time to be held for a moment, or even carried, so as to be likely to come in the direction of either man or beast. One who strictly abides by this golden rule would be less liable to accidents, even if he went from his door with goth barrels cocked, than he who neglected it for a few frivolous maxims.

Although we are not all blessed with such nerves as to aspire to being first-rate shots, yet I have no doubt but almost every man may be taught to shoot tolerably well; and indeed the art has of late been so much improved that, although but little more than half a century ago one who shot flying was viewed with wonder, we now frequently meet with schoolboys who can bring down their game with the greatest dexterity.

Most men who can in a slow, bungling manner kill more birds than they miss, or now and then shoot brilliantly, have the name of being "excellent shots"; and as this character has an opening for scandal, the world is too happy to indulge them with a circulation of it, while others who have real skill are laughing in their sleeves, and have real sense to conceal it.

But (to be brief, which is here my study) allow me to suggest an humble attempt for the instruction of the complete novice. First, let him take a gun that he can manage, and be shown how to put it to his shoulder, with the breech and sight on a level, and make himself master of bringing them up to a wafer.

Then (with a wooden or bone driver, instead of a flint or anything to protect his lock from the concussion of iron versus iron, if a detonator), let him practice at this mark, and when he thinks he can draw his trigger without flinching, he may present the gun to your right eye, by which you will see at once if he is master of his first lesson. In doing this, he must remember that the moment the gun is brought up to the center of the object, the trigger should be pulled. as the first sight is always unquestionably the best.

Then send him out to practice at a card with powder, till he has got steady, and afterward load his gun occasionally with shot, but never let the time of your making this addition be known to him, and the idea of it being perhaps impossible to strike his object, will remove all anxiety, and he will soon become perfectly collected.

The intermediate lesson of a few shots, at small birds, may be given; but this plan throughout must be adopted at game, and continued in the first instance till the pupil has quite divested himself of all tremor at the springing of a covey, and observed in the last till most of his charges of shot have proved fatal to the birds. If he begins with both eyes open he will save himself the trouble of learning to shoot so afterward. An aim thus, from the right shoulder comes to the same point as one taken with the left eye shut, and it is the most ready method of shooting quick.

Being careful to remind him (as a beginner) to keep his gun moving, as follows: Before an object, crossing; full high for a bird rising up, or flying away very low; and between the ears of hares and rabbits, running straight away; all this of course in proportion to the distance; and if we consider the velocity with which a bird flies, we shall rarely err by firing, when at forty yards, at least five or six inches before it. (As the barrels of double guns usually shoot a little inward at long distances, there is so far a preference in favor of the right barrel for an object crossing to the left, and vice versa, that if we were beating along the side of a hedge, it would be best to keep the barrel next to it in a state of preparation.) Till the pupil is *au fait* in all this, he will find great assistance from the sight, which he should have precisely on the intended point, when he fires. He will thus, by degrees, attain the art of killing his game in good style, which is to fix his eyes on the object, and fire the moment he has brought up the gun. He may then, ultimately, acquire the knack of killing snap shots, and bring down a November bird the moment it tops the stubble, or a rabbit popping in a furze brake, with more certainty than he was once used to shoot a young grouse in August, or a partridge in September.

Many begin with very quick shooting, and kill admirably well; but are often apt not to let their birds fly before they put up their guns, and therefore dreadfully mangle them, and I have observed, are not such every day shots as those who attain their rapid execution on a slow and good principle.

Others potter on in the old way all their lives, and offer to shoot with any man in England, because they can cock an eye and kill twenty slow shots running! Such adagio sportsmen take care never to fire random shots, as they call all, that are the least intercepted or confined to time; but usually point, and then take down their guns—a practice that is seldom admissible. Such is my opinion of a slow, poking shot, that I would rather see a man miss in good than kill in bad style. For instance, if I saw one man spring a covey of birds close to his feet and keep aiming at one till the covey had flown thirty or forty yards, and even bring down his bird dead, and another man miss both barrels within the same distance, I should say perhaps the latter, if in good nerve, may be a good shot, but I was quite sure that the former never could be one, because he was a hundred years behindhand in the art of using a gun. I know many old pokers who would feel sore at this assertion; but this I cannot help; it is my humble opinion, and therefore I have a right to give it.

There are few of my young readers, I dare say that have not at some time or other met with a man who, wishing to show off his shooting, has never fired but when he was pretty sure of killing, and whose pride was to be able to boast after dinner, that he had bagged so many birds without having missed a shot the whole morning. But before we give this person credit for the name to which he aspires, let us ask him whether in so doing he brought home as much game as he ought to do? Or whether, in order to bag a dozen head of game without missing, he has not refused at least twenty shots in covert, etc., and, taking all chances, about eight or ten of which ought to have been killed? It is generally the mistaken idea of those who are no judges of shooting, that if a man kills a certain number of times without missing, he is to be put down as a first-rate shot; and that another person, because he has been seen to miss, is to be considered as his inferior.

For example, the one man goes out and springs birds enough to fire fifty times within forty yards, and perhaps, being a reputation shooter, only twenty of these shots happen to suit his fancy. He never fires a second barrel unless the birds rise one at a time, or a covey happens to spring from under his feet; and in short, he kills his twenty birds in twenty shots. The other man takes the whole of the fifty shots, many of which may be very difficult ones, and under extreme disadvantages; he kills thirty-five and misses fifteen. A fair sportsman and really good judge, I conceive, would not hesitate to say that the latter has claim to be considered the better shot of the two.

We will then bring a first-rate shot into the field, and he shall kill forty-five out of the fifty (never failing of course to work both his barrels on every fair occasion); he will then have missed five times; and would any old sportsman judge so unfairly as to place before him the never-miss gentleman with his twenty trap shots running?

For my part, I should not, even if he missed an open shot or two within five yards of his nose; because such a circumstance might arise from his being nervous, or an accident, when the other, if put to the difficulties that he had been doing, would acquit himself no better than an old woman.

If such a person, therefore, has a pride about him, and wishes to be thought a great shot, let him throw aside his double barrel, and under the plea of having only one charge to depend on, he may come off with great éclat among the average of shooters.

With regard to the distance which constitutes a fair shot, there is no speaking precisely; but, as far as such things can be brought to paper, and guns to an average, I should say that, provided a gun is held straight, a bird should scarcely ever escape at forty yards; and that that is the outside of point-blank range, although at fifty yards the chances are three to one in favor of killing, with a good aim; but as a gun never shoots twice alike, a bird at this distance may sometimes be struck with three or four shot, and at others may escape through an interval, though the piece be never so well directed. But if a pellet should take a bird in a vital part, or the wing, at seventy or even eighty yards, it would probably come down, though the odds (at such distances) are of course against your hitting it at all. Birds flying straight away or coming to you require a much harder blow than those crossing or flying directly over your head; by reason that, in the first instance, they are partly shielded by the rump, and in the second, the feathers are apt, at long distances, to glance the shot.

Under these circumstances a man must either pick his shots or occasionally miss, though his gun be every time held straight. I may venture to say there is no sportsman living who has not been known to miss the fairest of shots; and there are very few but now and then in a season will shoot badly for a whole day. It stands to reason when the most skillful may become for a time unnerved for shooting, by ill-health, oppression of mind, one night's debauch, or anything that will operate on the temper or nerves.

One who vexes himself about missing a fair shot is the less likely to support himself at all times as a first-rate performer, because that vexation alone might be the very means of his missing other shots, and therefore he could not be so much depended on as another man who bore the disappointment with good humor. When a good shot misses from being nervous, it generally occurs through his left hand dropping as he pulls the trigger; and, if it happens that his gun should miss fire, he will immediately detect this by seeing that the muzzle has fallen below the line of aim. The best way to remedy this is to make a firm resolution to fire full high, and firmly grasp the stock for a few shots; and as soon as a few birds have fallen handsomely he will, most likely, recover his nerves and his shooting. I have luckily felt just enough of this annoyance to enable me to prescribe a little remedy for it; as I well know the unpleasant feelings of a shooting sportsman when deprived of his usual skill—he becomes like one with gout, love, or seasickness—cruelly tormented and laughed at into the bargain.

When two persons are shooting together, there cannot be a more simple way of avoiding confusion than for each man, when a covey rises, to select the outer birds on his own side. Let all birds that cross belong exclusively to that shooter for whose side their heads are pointed; and let all single birds that may rise and go away fair for either person, be taken alternately, and left entirely for the two barrels of the shooter to whom they belong. By this means there is no "wiping of noses!" as they call it; no "blazing a volley into the brown of 'em!" or, in other words, no jealousy; no unfair work; and two sportsmen may thus shoot coolly together with good nerves and in good friendship, instead of with jealousy and greediness, which not only destroys all pleasure, but soon lessens their good shooting, if not their good fellowship. I adopted these regulations for three seasons, with one of the best shots that ever went into a field; and our diversion by this means invariably went on so pleasantly that we shot with additional confidence when in each other's company. The gentleman alluded to was my lamented friend, the late John Ponton, Esq., of Udders House, Dorset.

Taking the average of shooting companions, however (except to beat a double hedge-row, or divide what could not be seen on both sides), I should pardon any old sportsman for saying that he would rather have their room than their company.

For one who professees himself an adept with a double gun, it is expected that he will kill a bird with each barrel, almost every time the covey rises within fair distance; unless impeded by the smoke of his first barrel or other obstacles, which he should endeavor to avoid. The usual method is to take down the gun, and present it afresh after the first shot; but as I have seen fourteen successive double shots killed the other way, I venture to recommend it as being more expeditious. It is never to take the gun from the shoulder till both barrels are fired, by which means so little time is taken between the two shots that the first, as well as the second, bird, may be suffered to fly to a proper distance; and let those who are not to be trusted with both barrels cocked, get the gravitating stops or use a single gun.

Since publishing the first edition of this work, I have seen on the plan here recommended fifteen double shots at partridges fairly killed in succession, provided I may be allowed to include one of the number which towered and fell at so great a distance that it was never bagged. It is of course not meant to include among these doublets such birds as were sprung by the report of one barrel, and killed with the other. Shots of this kind certainly intervened, as well as single ones at different sorts of game. The number altogether killed by the same person in about five days amounted to sixty head, without one miss.

As a further proof of the quickness with which two barrels may be correctly fired, provided the gun is kept to the shoulder, I shall mention an instance: John Ford, game-keeper to the Earl of Portsmouth, and a man about six feet six, laid his gun on the ground, of course with both barrels cocked; and after throwing off two penny pieces himself, he took up his gun and hit them both, most handsomely, before either fell to the ground. He requested me to try with his gun if I could do the same. At first I failed for want of being what we used to call at Eton a good "shy;" but after Ford had given me a few lessons in the throwing department, I did it the first time (though, perhaps, more by luck than skill), putting five shot in one and six in the other, which led me to conclude that, by practice, this might be reduced to about the same

Garfield Gun Club.

Under date of Nov. 17, the Garfield Gun Club, through its secretary, Dr. J. W. Meek, has issued the following circular notice:

"The postponed semi-annual meeting of the club will be held at the office of the secretary, 182 Park avenue, Wednesday, Nov. 26, at 8 o'clock P. M. The club has just closed a most successful season of twenty-one shoots as per inclosed statement. Owing to the recently passed city ordinance, there will be no pigeon shooting on our grounds this winter. There will be no more target shooting on our grounds until next May, except by special notice."

Trophies awarded during the season:

First Series— Dr. J. W. Meek, Class A; T. W. Eaton, Class A; A. D. Dorman, Class A; Dr. J. Huff, Class B; J. McDonald, Class C.

Second Series—A. Hellman, Class A; G. W. Drinkwater, Class B; C. H. Kehl, Class C.

Third Series—L. Thomas, Class A; J. McDonald, Class B; M. T. Wilson, Class C.

Targets during the season, 27,322; targets broken during the season, 18,618; club average, .6810; Targets thrown during season in trophy shoots, 8,857; targets broken during season in trophy shoots, 6, 120; club average, .6932.

Club averages: 1893, .7138; 1894, .7129; 1895, .7131; 1896, .6696; 1897, .7206; 1897, .7144; 1899, .6241; 1900, .6618; 1901, .6805.

degree of certainty as other quick double shots. As to a man with his gun in his hand throwing up and hitting two penny pieces, or halfpence, it is no more than what many good shots can do, by the mere knack of catching the first just after the turn, and presenting well under the second; but the other performance is really a difficulty. Let some of the pigeon shooters try this by way of a "spree," and they will save a deal of innocent blood, and find they have enough to do. Most people will say, "This is not like shooting birds." True; but I say this: It distinguishes, to speak musically, the prestissimo from the allegro in handling a double gun; and this is one of the points by which we may judge as to the brilliant or first-rate style of shooting. But Ford is a capital game shot also; and as for his talent as a dove butcher, a pair of old blues have no chance with him, though he is unknown to all the celebrated artists of the trap. (His gun was made by Willmot, of Andover, successor to Long, and *eleve* of Parsons; and never, since the days of Joe have I seen one that pleased me better in the mounting. Since the sixth edition, Willmot has gone off on "spec.," to America, where I hope my recommendation, though not I, may follow him.)

Many sportsmen of the old school would be quite irritated if laughed at for their extreme caution in never allowing their gun to be cocked till after the bird had risen; but if they will show me one among them that can cock a gun and bring down a snap shot with as little loss of time as one who had nothing to do but to present and fire, and particularly in making double shots, I will resign all pretension to argument on the subject. This system may have done very well half a century ago, when they might almost have "put salt on the birds' tails," and when the art of neatly using the second barrel was wholly unknown; or even now, among the tame birds in the preserved turnip fields of Norfolk and Suffolk, where they may pick both their shots or keep the second barrel for the chance of springing another bird. But those who shoot on this system in a wild country would stand a poor chance in competition with one who went up to his game with both barrels cocked at a time when the birds were wary, and when the loss of an instant made the difference of ten yards in the distance. Then only is it that the difference is to be seen between a first and second-rate shot; and consequently that those who pride themselves on skill instead of easy slaughter, have the opportunity of distinguishing themselves. The argument, therefore, as to not cocking a gun can only be heard on the question of safety. And here again I must confess I have my doubts as to their correctness. We will put a cool and steady old sportsman out of the question; but suppose an eager young man, who is unaccustomed to shooting walks up to his dog with his gun half-cocked; the moment the birds rise he is in such a state of agitation that in attempting to draw back the cock of his gun with a trembling hand he lets it slip before the scear has caught the tumbler. Off goes the gun! and the best fortune that can be expected is the happy escape of a favorite dog, or the life of his fellow shooter. While, on the other hand, if he goes up with his gun cocked, and his companion or follower sees that he advances with the muzzle in a safe and elevated position, the worst than can happen is that he may fire it by accident in a direction that may be as likely, or more so, to kill a bird than when he aimed at it, or, at all events, in one that could endanger neither man nor dog. With regard to presenting a gun, the hand when near the guard is in the safest, and when grasping the stock, in the firmest position. Here let the shooter please himself.

Avoid squaring your elbows when you present a gun; it gives you an unsteady position, and has the same outlandish appearance as the squared elbows of our half strangled exquisites who drive about the streets. Nothing can be neatly or gracefully done that is not done with ease; and a man may as well say that he can sit with the same comfort in the stocks as on a sofa, as that he can in reality or appearance be as easy with his elbows forced outward as when in their natural position.

If we consider for a moment, then, we shall perceive that in doing most things, squared elbows have not only an unskillful, but an ungraceful appearance.

When a man is no further versed in shooting than just to have become quite expert at bringing down his bird, I conceive that he has only learnt about one-third of his art as a shooting sportsman. Knowing where to place himself for shots—how to spring his game to advantage—what days and weather to choose for the different kinds of sport—constitute at least the other two-thirds, till he is master of which he may often get beat in filling his bag by a very inferior marksman to himself. Again: admit him to have learnt everything in the ordinary way, then comes wildfowl shooting, the requisites for understanding which are so totally different that there are many of the greatest field sportsmen in the kingdom who know no more about it than children.

Jackson Park Gun Club.

PATERSON, N. J., Nov. 23.—The shoot of the Jackson Park Gun Club this afternoon was quite a success in regard to the number of shooters and the birds. The events were shot off in the short time which remained after the contestants all had arrived at the grounds. Some of them did not arrive till after 2 o'clock.

The first gun was fired about 11:30, and the competition was kept going continually until dark, which came soon after 4 P. M. The birds were a fine lot; very few sitters, and the most of them extra fast. The most of the misses can be explained better by saying that the birds were too fast for the boys.

Everything was kept going quite lively all the time, under the leadership of Count Lenone, of Passaic, who has just been elected to the captaincy of the club. He kept his end up, as the scores will tell, with some of his wonderful one-barrel shooting.

We expected more shooters up from the city by the 12 o'clock train, and kept the programme back on that account. We made the events to suit the shooters present.

There were quite a few visitors from out of town: Capt. A. W. Money, Tom Morfey, Bill Hobart, Sim Glover, Mr. Craft, Welles, D. F. Pride, and our old friend Frank Butler, and Herrington.

Every body seemed to be enjoying themselves, and getting all the shooting and pleasure out of the afternoon that was possible. It was an ideal day for outdoor pleasure.

There were one or two matches made, but no dates made. Doty vs. Morfey, and Doty vs. Glover in January; no date; each 100 birds, $100.

The 7-bird events were $3 entrance; the 10-bird events were $5. The last event was at 10 birds, but we had to stop at 5 birds. The scores:

The Interstate Association's Annual.

RAINMAKER'S CAMP, SLIPPERY ROCK, Pa., Nov. 19.—*Editor Forest and Stream:* Will you please be kind enough to again announce in the trap department of FOREST AND STREAM that the annual meeting of the Interstate Association will be held on Dec. 11.

Gun clubs desiring the assistance of this organization in holding tournaments during the season of 1903 should have their applications in the hands of the manager (Mr. Elmer E. Shaner, 111 Fourth avenue, Pittsburg, Pa.) no later than Dec. 8, in order that they may be presented to the tournament committee for action thereon.

ELMER E. SHANER, Manager.

The hustling manager of the Brooklyn Gun Club, Mr. J. S. Wright, informs us that he will hold a shoot at Interstate Park, L. I., on New Year's Day. He will have his programme ready in a few days.

IN NEW JERSEY.

Emerald Gun Club.

NEWARK, N. J., Nov. 18.—The November shoot of the Emerald Gun Club was held on Smith Brothers' grounds to-day. The handicap was both distance and points. The veteran, Dr. Hudson, made a straight score in the club event, and was alone with first honors. The birds were a fair lot. Eight of the contestants scored 9. The scores follow:

A Schoverling	7	30	2222222*22— 9

Jeannette Gun Club.

GUTTENBERG, N. J.—Messrs. Pape and Schortemeier killed 10 straight in the club event, the latter waiving his claims in favor of Mr. Pape, who thereby won Class A without any shoot-off. C. Thipsen won Class B for the third time and was transferred to Class A in consequence. The birds were an excellent lot.

Schumacher, by killing the last bird, saved the team race.

Hudson Gun Club.

JERSEY CITY, Nov. 23.—Following are the scores made at the last shoot of the Hudson Gun Club.

The club members have begun to take an old-time interest in affairs again, and the attendance has been good of late. The Hudsons will hold an all-day shoot on Dec. 14. All shooters are invited. The club will furnish a chowder and other refreshments, and the members will try to make all feel at home.

The annual meeting of the club will be held on the first Friday evening in January at 409 Tonnele avenue, Jersey City. Officers for the coming year will be elected, and such other business transacted as may come before the club:

Match, 25 targets: H. M. Brigham 22, L. C. Hopkins 17, W. J. McConville 15, W. S. Wigham 14.

Colorado Springs Gun Club.

COLORADO SPRINGS, Colo.—A small practice shoot was held by several of the members of the Colorado Springs Gun Club, Nov. 17, at the grounds of the club at Broadmoor. The feature of the shoot was the long run of 154 by Mr. Frank C. Riehl, of Illinois, who was a guest of the members of the club. Mr. Riehl is a trade representative, and this is his first trip to Colorado in the interests of his company. He was in the city, and as he does a little shooting from time to time, decided to accept the invitation of the members to go out and take part in the shoot. Quite a number of professional shooters have shot here from time to time, but Mr. Riehl took the feather from them all yesterday. He shot in splendid form and good time, breaking his targets beautifully, and missing but four out of 200, giving him an average of .98. The weather was clear and very pleasant, and there was practically no wind, making it a fine day for the sport.

The shooting of Mr. D. C. Sanderson was not up to his usual standard, as he had been changing guns, and it will require some little time for him to get used to his new weapon.

Events:	1	2	3	4	5	6	7	8	9	10

Cincinnati Gun Club.

CINCINNATI, O.—The ten best scores of twelve high men in the Cincinnati Gun Club's prize contest are appended. The best scores to date are included. There are nine prizes, but as the last seven men are so closely bunched, their scores are put in also.

There are four more contests for these prizes.

The upper figures are the distances at which scores were made.

We go to Mechanicsburg, Ohio, next Tuesday, the 25th, to shoot that team for the Phellis trophy.

Ossining Gun Club.

OSSINING, N. Y.—The main event at the regular Saturday shoot of the Ossining Gun Club was at 25 clay birds for a silver-mounted umbrella. The handicap allowances were misses as breaks. I. T. Washburn, Wm. Clark and Hans (H. W. Bissing), with their handicaps, made top scores of 25 each. The shoot-off was under original conditions, 25 birds with handicap. Mr. Bissing, who has been considerably under the weather, decided not to shoot off, as he did not feel equal to the extra 25 birds. Clark, shooting in fine form again, made 25, with Washburn only one bird behind.

HAWKEYE.

PUBLISHERS' DEPARTMENT.

Bird Calendar.

THE Massachusetts Audubon Society has recently published a beautiful calendar for 1903, illuminated by six figures in colors of familiar birds. The species are chosen with reference to the seasons, and are snow bunting, fox-colored sparrow, Baltimore oriole, wood thrush, meadow lark and red crossbill.

The publication is useful as a calendar and also extremely ornamental. On the back of each sheet, the front of which shows the calendar for two months and the picture of the bird, is a description of the species, of its nest and eggs, and a short account of its habits.

The calendar is published by the Tabor-Prang Art Co., of Springfield, Mass., and the figures are copyrighted by Mrs. J. W. Elliot, of Boston, Mass.

The Whitestone Hollow Spar and Boat Company have commenced the construction of a very modern and large plant at Whitestone Landing, Long Island, N. Y.

This firm will be under the personal management of Mr. J. C. Fraser, who has been at the head of the Spalding-St. Lawrence Boat Company since its organization.

The concern expects to occupy and operate the new plant some time next January, and will build a line of St. Lawrence River skiffs, canoes, sailboats, yachts' davit boats, launches, hollow spars, etc., as hitherto at Ogdensburg.

This change of location has become necessary on account of the fact that the greater part of that company's product goes to tidal waters, and the Ogdensburg plant, on account of a rapidly increasing business, has become inadequate.

HON. H. A. CASTLE, Auditor for the U. S. Post Office Department, says in the July, 1902, North American Review: "A measure is now pending in Congress embodying what is known as the 'Post Check' System, which is intended to furnish something more simple and accessible than money orders for ready use in making small remittances. To adapt these notes to their purpose it is provided that the words 'payable to bearer on demand' shall be eliminated, and the words 'payable to the payee named herein; payable to bearer if the spaces are not filled,' be substituted. These notes will thus pass from hand to hand as currency until the blank space is filled. Thereafter they are payable only to the payee; they can be redeemed at any money order office, and they will not again be used as a circulating medium. They will find their way by legal channels to the United States Treasury, where they will be handled and destroyed as mutilated currency.

This plan seems to be practicable, to accomplish several desirable results simultaneously, and to afford accommodation to the entire public at a minimum of labor and expense. The saving that would be effected by treating the paid and cancelled notes as mutilated currency, instead of vouchers; the intricate reports and interminable columns of figures that would be abolished; the simplicity of accounting and certainty of correct adjustments that would supersede present complications and uncertainties, can only be appreciated by those familiar with the crude methods employed in the Auditor's office for bringing forty millions of money orders annually into dubiously accurate relations with the thirty thousand postmasters who issued and paid them."

Citizens should request their representatives in Congress to see that more convenient money is furnished the people.

FOREST AND STREAM PUBLISHING COMPANY, NEW YORK.

For Anglers and Big Game Hunters.

A Big Game and Fish Map of New Brunswick.

We have just had prepared by the official draftsman of New Brunswick a map of that province, giving the localities where big game—moose and caribou—are most abundant, and also the streams in which salmon are found and the rivers and lakes which abound in trout.

The resources of New Brunswick in the way of game and fish are only just beginning to be appreciated, and we are glad to offer to FOREST AND STREAM readers the first authentic information as to localities where sports may be had. The map is printed in colors, on a tough paper, and is enclosed in a stout manila envelope for protection in carrying. Price $1.

THE "REGENT."

A WONDERFUL NEW ENGLISH HAMMERLESS.

Price, $65.00 net, worth double.

The cut does not do justice to the gun, but we can guarantee them to be made by the best gunmaker in England and bored on the same principle that has won world wide honors for English guns.

The barrels are best Siemans Martin steel, and the shooting is unexcelled. The stocks are selected English walnut, latest model Anson and Deeley action, top automatic safety, nicely engraved, and finish and workmanship throughout up to the best English standard.

English guns have long been the standard of the world, and this new product will mark a new era in price as well as quality.

We have never before been able to offer so fine and good a gun for so little money. They can be supplied in weights from 6¼ lbs. to 8 lbs., in 12 bores, and from full choke to true cylinder.

We carry a large line of guns and rifles from $6.00 to $600.00, and are sole U. S. Agents for the celebrated W. W. Greener.

WINCHESTER .33 CALIBER

A NEW LARGE CALIBER HIGH POWER RIFLE.

BIG game hunters who have advocated a large caliber high-power rifle will find in the new Winchester .33 Caliber a gun that will meet their requirements. The popular and reliable Winchester Model 1886 Rifle has been adapted to handle this new cartridge, which is large enough and powerful enough to kill any big game known. The Winchester .33 Caliber Rifle is made in solid-frame or take-down style, with a 24-inch round nickel steel barrel and weighs about 7 3-4 pounds. The "Take Down" *lists* at $30.00 and the Solid Frame gun at $25.00. The Winchester .33 Caliber belongs to the high-power Smokeless-powder class of cartridges, having high velocity and flat trajectory, and which develop great striking energy and penetrating power. The .33 Caliber bullet weighs 200 grains, and with the load of Special Smokeless powder used in the cartridge develops a muzzle velocity of 2,050 foot seconds and a muzzle energy of 1,868 foot pounds. The penetration of this cartridge with a soft-pointed metal patched bullet at a distance of 15 feet from the muzzle is 12, 7-8-inch pine boards. Soft pointed bullets used in this cartridge have special upsetting, or mushrooming, qualities, owing to their high velocity. This makes the Winchester .33 Caliber a particularly desirable cartridge for big-game shooting, as mushrooming bullets of this size, have terrific killing power. For all practical purposes this cartridge is as powerful as the .30 U. S. Army or .303 British, and the fact that it is of considerably larger caliber is considered by some an advantage in its favor. Send for full description of it.

Yacht and Boat Sailing,
By DIXON KEMP, Associate Institute of Naval Architects. Price $12.
This edition has been largely re-written, and contains a great number of new subjects, and the lines of many boats never before published, the total number of plates, exceeding 100, besides more than 350 woodcuts in the text. Contents: "Selecting a Yacht," "Examination of the Yacht," "Building a Yacht," "Equipment of the Yacht," "Seamanship," "The Management of Open Boats," "The General Management of a Yacht," "The Rules of the Yacht Racing Association," "Yacht Racing; Handling a Yacht in a Match," "Centerboard Boats," "Centerboard Boats for Rowing and Sailing," "Sails for Centerboard Boats," "Small Centerboard Yachts," "Mersey Sailing Boats," "Clyde Sailing Boats," "Belfast Lough Boats," "Dublin Bay, Kingstown Boats," "Cork Harbor Boats," "Itchen Boats," "Falmouth Quay Punts," "Thames Bawley Boats," "Lake Windermere Yachts," "Yachts of the Norfolk Broads," "Small Yachts and Boats of Y. R. A. Rating," "Singlehanded Cruisers," "Types of Sailing Vessels," etc.
FOREST AND STREAM PUBLISHING CO.

CANOE CRUISING AND CAMPING.
By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.
This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.
Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

Samoa 'Uma

Where Life is Different.

By Llewella Pierce Churchill.

ANNOUNCEMENT.

Under the attractive title Samoa 'Uma, or "All Samoa," Mrs. Llewella Pierce Churchill has written a book for which she gathered the material during a residence at Apia, where her husband, William Churchill, was the American Consul-General. The conditions of life at the Consulate were most favorable for a study of the people, and with the instinct of a journalist Mrs. Churchill improved the opportunity to the full. As a woman she won confidences which would have been denied to a man, and acquired a vast fund of interesting lore which would have been withheld from one less sympathetic and less fully trusted. Thus she learned and has here described the real Samoa, that is the Samoans as they are.

The successive chapters give an admirably complete picture of a people in whom, as we read of them in these vivacious pages, Mrs. Churchill compels us to feel an unflagging interest. The book is well balanced; there is just enough of the history of Samoa to give an understanding of the events which have brought a portion of the islands under the flag of the United States; and just enough of description to make an appropriate and effective stage setting. But the chief characteristic of this brightly written book is action of incident and story. It is writing of the sort that has movement, and leads one on from page to page.

"Samoa 'Uma" is not exclusively about the Samoans; there is a chapter on Papalangi life, from which it appears that living in Samoa is so different; and some of the best things in the book are the personal experiences and adventures of this particular Papalangi woman, whose love of outdoor life led her on frequent excursions amid the coral reefs and into the dark jungles.

All in all, it is a book that will be read through, and read more than once. Here is the list of chapters:

CONTENTS:

I.—The Real Samoa.
II.—The Samoan Family.
III.—The Samoan Housewife.
IV.—Courtesy and Ceremonies.
V.—Kava—The Ceremonial Drink.
VI.—Music and the Siva Dance.
VII.—Handicraft and Art.
VIII.—Fishers and Sailors.
IX.—Shooting the Apolima Passage.
X.—The Weed that Catches Fish.
XI.—Torches on the Reef.
XII.—The Palolo Anniversary.
XIII.—The Chase of Rats.
XIV.—Things that Creep and Crawl.
XV.—The Wreck of the Schooner Lupe.
XVI.—Samoan Fickle Brides.
XVII.—The Vampires of the Tuasivi.
XVIII.—Beachcomber and Missionary.
XIX.—Copra and Trade.
XX.—Papalangi Life.
XXI.—The Story of Laulu's Hunt.
XXII.—The Great Vaiala Steeplechase.
XXIII.—Some South Sea Hoodoos.

ILLUSTRATIONS:

EAGLE CATCHING.

IN New York, Connecticut and some other States the eagle is protected and the slayer of one is made to pay a good round fine or go to jail. In Norway the eagle is recognized as a public enemy, a price is put on its head, and bounties are paid on 500 or 600 eagles a year. Now an eagle is an eagle, in New York or in Norway, and it might be thought that the same treatment would be meted out to it in both countries. It is altogether a question of how much harm it does. In Norway the bird is abundant and preys on other creatures which man considers of more value than the eagle. In some parts of America the bird is now extremely rare, does comparatively little damage to wild game or domestic stock, and is not only tolerated, but regarded with the sentiment which attaches to most forms of animal life which have become but as remnants and survivals. The immunity given the eagle is by no means universal in the United States. In Florida where, as is stated on another page, the eagle preys on young lambs, there is no disposition to protect it. Man never cherishes a wild creature which does him material harm; farmers who are trying to raise sheep have no use for eagles.

One of the methods employed by Norwegian eagle catchers is a close counterpart of the stratagem practiced by some of the American Indians of the West. The eagle hole of Norway as described by Barth is this:

A man takes his place in a hole dug in the earth for the purpose, alongside which is placed a piece of meat so near that the eagle, when it settles on the bait, can be reached by the hand. The hole, the depth of which is such that the man when he sits or stands therein has his head above the surface, has a little opening of turf or stone, which, when the occupant has taken his place, is so arranged that it can easily be thrust aside, and through it the man keeps watch. Here he may have, perhaps, to wait for an entire day without result; but when the bird descends and begins to eat the bait, he stretches out through the opening and seizes it, dragging it at once underground, when he puts his knees on its beak and breaks its neck. The whole is carried out so quickly, and the aperture is so narrow, that the eagle has neither time nor room to use its powerful weapons. I have, however, seen a man who had had much to do with this kind of pursuit, who bore very evident marks of the eagles' sharp talons.

The eagle catching stratagem employed by the North American Indian was practically identical with that of Norway. A pit was dug and covered with twigs and earth and grass, in which the hunter concealed himself, and seized the eagle when it descended to take the exposed bait. The Greenlanders in like manner catch the sea eagle by luring it to a hole in the snow in which the hunter is covered up; and a Greek writer who wrote at Constantinople in 1270, records that in his time fowlers took hawks in the same fashion by luring them to bough houses and seizing them as they struck at the live pigeon decoy. Thus the mode is not only widely practiced among the races of mankind, but one which was adopted early in the history of primitive man.

MAINE GUIDES.

COMPLAINTS have been renewed this year of visitors from Ohio and Indiana who invade the Maine woods in large numbers, carrying in their own supplies, hiring only one registered guide for a whole party, and enjoying their outing without leaving much money behind them for the people of the State. Maine folks look upon the game and fish as resources having a cash value, and in exchange for which the visitor who reduces them to possession should make over some equivalent. One suggested expedient to correct the evil of free hunting is a modification of the guide law, in such a way that each individual "sport" must have his own guide; or that not more than two "sports" may have a guide in common.

Two reasons are advanced for the proposed change. It will compel every visitor to contribute to the support of the guides; and it will assure a more stringent espionage on the doings of the visitor while in the woods. There are guides who will abet violations of the law; but there are also very many guides who will neither break the law themselves nor allow their employers to do so. The more intelligent guides—and in a growing proportion Maine guides are becoming intelligent in this thing—recognize that if their occupation is to last the game must be protected, and if the game is to be protected the law-breaking "sport" must be restrained. Guides who have convictions like these and the courage to live up to them are the most powerful agents in the Maine woods to compel respect for protective laws. It is not too much to say that the Maine guides practically have in their own hands the efficient protection of Maine game; or certainly would have it, if the law provided that not more than two sportsmen could go with one guide. How far the guides, having this opportunity, may be looked to to exercise the power it gives them must depend altogether upon how fully they may realize the situation and apply common sense to it. If they shall stand for game protection their employment will be as permanent as that of the farmer. And there is reason to believe that the trend of guide opinion is toward the support of the law, the discouragement of illicit game killing by their employers, the preservation of the deer and the moose, and the perpetuity of their own business interests. To adopt this principle and to live up to it often means the exercise of a high degree of moral courage. If any man on earth is sorely tempted, it is the Maine guide who finds himself confronted with the choice between being party to game law violation and losing his job. Scores of men who go into the Maine woods in the summer months and employ guides, are wholly without any principle when game is in range. They mean to have their venison, and if the guide stands in the way, they will dismiss him, and he will find himself out of employment. If he is of just the average type of man material, as we find it in the woods and out of them, he swallows his scruples and keeps his job. If he is a man of strong convictions and has the courage of them, he lets the visitor find another guide. The growing tendency, it is ventured to say, is now toward adopting the principle of living up to the law; and the time may come, much sooner than might be anticipated, when this will be the practically universal attitude of Maine guides. When that shall be the case, the guide occupation will be one of increased worth and dignity, and of tremendous influence for good. As has been said, they will have in their own hands for their own efficient control the protection of Maine game.

A MASSACHUSETTS GAME REFUGE.

THE readiness with which all wild creatures respond to protection by man is well known. Pretty much all things that wear feathers or hair would regard man as a friend rather than an enemy, if he would but give them the opportunity, and it is only the universal human desire for killing that makes birds and mammals wild. A familiar example of this tameness under protection is seen in the game of the Yellowstone Park, much of which is no more shy than the cattle in our fields. We see the same thing on Long Island, where, during the greater part of the year, the deer feed in the fields or along the roadsides without paying the slightest attention to passers by. Cases of similar tameness in wild birds are common enough, and we have all of us heard of reptiles that came at call, and may remember the picture—printed a few years ago—of Mr. Jewell, of Hartford, calling his frogs to dinner by the sound of a bell.

All this, of course, opens up great opportunities for observation and pleasure to people who control or are near considerable areas of protected land and water.

Such areas are happily growing more numerous in these days. Reservations are being set aside in States and Territories, and parks established in counties and towns and cities; and where this is done the wild birds and animals are quick to take advantage of such places. Such parks are protected; not always very well protected, perhaps, yet the difference between promiscuous pursuit at all hours of the day and night, and the occasional shot of the sneaking poacher is a wide one, and the wild things recognize the difference.

It is only a year or two since a flock of wild geese cleaving the air with arrowy flight during their migration across New York city, called down by the voices of some domesticated wild geese in the Zoological Society's park in the Bronx, were induced to give up their journeying, and are now daily seen by the visitors to that interesting place.

One place of this kind—a refuge and a resting spot during the migration—is found in Spot Pond, lying within the area of a park reservation in Massachusetts, surrounded by the towns of Malden, Medford, Melrose and Winchester. Shooting is prohibited there and the birds come there, alight, feed, rest and remain, thus teaching to sportsmen and naturalists a lesson which might well be remembered and acted on. This, in fact, is a game refuge, such as was first advocated, if we recollect aright, by Mr. Willard G. Van Name, of New Haven, Conn., a number of years ago.

Spot Pond, we are told, is a resting place for a great flock of sea gulls, which pass the night on its waters and in the morning resort to the sea shore to feed, returning again before dusk. Here, too, are said to be no less than 1,500 black ducks, as well as many others of different sorts, many of them probably sea ducks, for it is well known that, during the autumnal migration, the coots, old squaws, goldeneyes and other truly marine ducks are often found in fresh-water lakes far from the sea.

The superintendent of the park states that the aquatic population of Spot Pond is constantly changing. Almost every day fresh flocks arrive from the north, and other flocks take their departure for more southern waters. The noise of the birds' wings and their cries are heard at night and in the morning, and they have added a new feature of interest and attraction to the neighborhood. And not to the neighborhood alone, for we are told that people come long distances to the shores of this lake to view the interesting assemblage.

If a series of such refuges could be established up and down our sea coast it would be a great thing for sportsmen and naturalists, alike. More important than that, such refuges would do a valuable educational work in the sections where they were established, giving to people who know nothing about wild life the opportunity to rear broods whose presence in the neighborhood would be useful to sportsmen because they would attract birds to the region during the seasons when shooting is permitted.

The world moves. Game protective ideas advance. There have never been so many people anxious to have game—and life generally—preserved as now. We believe that the time is not far distant when the result of all this effort will be seen in the increased supply of living things.

If one-half of what C. M. Feuilliard, of Morehouseville, in the Adirondacks, writes of his neighbors can be substantiated, Chief Protector Pond may find there a state of affairs to engage his attention for some time. The record is one of deer jacking, hounding, crusting and killing out of season, trout slaughter and stealing timber from private and public lands. One of the worthies named is a supervisor, who is credited with having "fixed" a game warden who set out to investigate his doings. The list of offenses comprises pretty much all the crimes in the poacher's calendar; and not only are names, places, dates and witnesses given, but Mr. Feuilliard avers that in numerous of the transactions recorded, he himself had part. He has given earnest of his sincere wish for a cleaning up of Morehouseville by mailing a copy of his deposition to the chief protector at Albany.

The Post Check Currency bills now before Congress contemplate the issue of currency which shall circulate from hand to hand as the present currency does, but which when endorsed shall become a check payable only to the person to whom it is sent. This will provide a simple, convenient and safe mode of sending money by mail; and it goes without saying that such a system would be of incalculable benefit to all who have occasion to send money through the mails. The post check plan has been endorsed by the Postmaster General as "very simple and easily understood," and no substantial objections to the plan have been adduced. The public convenience would be served by the enactment of the measures into a law.

The Sportsman Tourist.

Two Years' Outing Across Siberia

(*Continued from page 403.*)

Life and Sport on the Trans-Baikal.

FROM the headwaters of the Amur, the route lay over the Iabloni range, thence across the valley of the Baikal, to the vast lake of that name—a beautiful journey. Negotiating the road-passes of the Iabloni Ciepa (pronounced ciera), little difficulty is experienced: the worst parts of the roads are on the upper ranges, and are almost knee deep in a coarse sand. It is cruel work on the horses, most all the year round, to pull telegas and tarantases over those shifty seashore-like dopori. In wet weather is, of course, the worst, when the adhering sand presents a "cling-surface" to everything enough to make even a leather-belting cling-surface specialist hate the very words which are one of his talking points. And, again, in winter, little snow falls in this region; sledges are seldom seen except on the frozen rivers, and the intense dry cold takes every particle of moisture out of the sandy roads and leaves them as soft and powdery as in the piping hot summer. If snow does fall, the Arctic temperature and the winds keep it on the move; for the flakes congeal into crystals, which in turn are expanded and exploded by the cold to an almost impalpable powder. Try to make a snowball of that snow, and you will fail; in pressing it together in your hands it will run through your fingers like silver sand.

A Lonely Station on the Trans-Cibirian.

The circum-Baikal route is probably the best sportsman's chance in Cibiria off the now open trans-Asiatic railroad system. There you will find bears and black foxes of a type whose skins are much sought for in furriery—and a combination of pleasure and money-making is never amiss. I have always held it is quite proper (whether you need the money or not) to make money honestly—to put, if possible, the spice of commercialism into your sport—to (if you will, in fact) respect and even love money. My experience with carping cynics who talk about "money muck" and profess to be "above it," is that they're not above "borrowing" your "money muck"; and, worst of all, never think of repaying it. Oh, no! it's not their "principle" to repay "money muck." I am induced to jot down this reflection on money by recalling an unfortunate central Cibirian experience, west of the Baikal; and still worse disappointments elsewhere in the world. However, should this paragraph reach the eyes of the Cibirski delinquent, I would say the debt has been "written off"; but he won't get another chance!

Boxing-in a Cibirian Forest: The Hugest Pole Fence Known.

In the approaches to the valley of the Baikal, as you near the dirty big village of Hijни-ydинck (pronounced Nijni-ydinçk), it will be noticed that the dense forests on either side ar for scores of miles roughly fenced in. Why? The forests are never used for anything—not even touched for timber or firewood. The villages are thirty to fifty verstas apart, and even the natives rarely venture into those black depths. So why the fenced-in protection? It had to be explained to me. The villagers' horses and cattle, in search of pasture, would stray miles and miles from the depebни—mostly along the great trans-Asiatic highway, and then turn off into the forest glades, and get remote into the forest depths. Thus far, so well. If let alone, the cattle would instinctively have found their way out and home again—if they wanted to. But probably many of the hard-worked horses found grassy dells beside tranquil lakelets, and preferred to stay there. Winter's approach would have reminded them that the snug village stables were (for six months of the year) better than the glacial depths of the forests, and accordingly they would have turned up at their stations by force of circumstances.

But, of course, their owners could not wait such a pleasure of theirs—I mean the horses. So men and children would start to explore the forests in search of the errants, and a comedy would turn into a tragedy! Divers of the searchers for the lost would hopelessly lose themselves. Without compass, a sky may be overcast for days and obscuring the sun—without woodcraft knowledge—running short of food (if they had the prevision to take any)—various of the younger folk have disappeared forever, in the years gone by; and even some of the older people have never been able to relate their experiences.

Any animal, no matter how unacquainted with water, will wriggle to land somehow if flung into a pond. Can the same be said of human beings? Our boating fatalities prove the contrary. A boatload of half a dozen persons, a poodle, a capsize and lo! the poodle proves the "noblest of them all"—i.e., he doesn't lose his head. Likely as not he proves the sole survivor; and, not content with swimming ashore, the noble canine will for hours—perhaps days—patrol the bank with his plaintive cries to get assistance for those for whom it will avail not.

So the Cibirian villagers, after repeated heartrending distresses over their lost ones, decided, "in extraordinary convention assembled," to take in hand the (for them) big task of actually fencing in the forests for scores of miles. Stop the cause: the effect will take care of itself. Of their own initiative, in their own time, the widely parted communes set to work to box in the forests. Each had its allotted sections to pole up. The process was rough, simple, but effective. Slim long firs were selected, a dozen blows of the hatchet, and down they came with a run. Speedily were the branches lopped off, which last were subsequently rounded up, bunched, and dragged to the villages for the winter's firewood: So the mujiks at least got the best part of their long winter's fire supply for their pains.

Now the slim tree lengths (without troubling to split them—for timber is too plentiful for that) were nailed bodily on to the skirting forest trees from tree to tree. There are three tiers of these tree-poles—high enough to prevent a trouble-meaning horse to clear, when being rounded up; and low enough to prevent colts and calves wandering thereunder.

The unique fence has well served its purpose. Without fence posts to rot (for, as just stated, the fence is nailed from tree to tree), in a pure, dry climate, that, the (I believe) hugest timber fence on the globe, will probably last another half-century.

And as you ride along day after day in the tarantas, and see that Cibirian "Chinese wall" (of wood) facing the black depths of the forests, you get to like it, and compare its comfortable top bar—just right for sitting on—to the inconvenience of the inhospitable American barbed-wire fence. For, personally, I consider the Yankee barbed-wire fence the most cussedestly uncomfortable seat to swing on that was ever conceived out of the brain of a depraved genius.

Sport on the Lake Baikal.

This is the greatest fresh-water lake in the universe, barring our own inland seas. It covers nearly 13,500 square miles. Baikal is an Arabic or Tatar word, meaning "rich water," or lake. Fresher-tasting lake water I never drank in my life: its freshness you seem to taste as an aromatic odor. Throughout the year—even in midsummer—the water is always under or little above zero centigrado. In the afternoons of the warm days of August, I would endeavor to bathe therein from the extreme southwestern shores, but the water remained so benumbingly cool, I could not stand it over a couple of minutes.

This low temperature is accounted for by the lake receiving its supply always from the snows of the Altai range. So pure is the supply, you can see the big white stones at the lake bottom through a score feet of water—and deeper still when the lake is frozen. The greatest depth of the Baikal has never yet beeen ascertained: soundings of over a mile deep have been made, yet without—in some places—touching bottom.

In fish, it is exceedingly rich. The neighboring towns and districts look to it for their fish supplies, and there is an organized fishing industry on a certain scale of magnitude. I often passed the ruins of fish cureries—showing how the scene of operations was often on the shift. The Cibirian towns depend on the Baikal for their kaviar (which they call, in Russian, *ikra*). This is obtained from the sturgeon; and the highest grade of isinglass comes from the same source. (It is, by the way, both comical and provoking how many ignorant people in America will persist in misapplying the word isinglass to and for mika, or mica.)

The sporting angler, then, touring across Cibiria, has in the great Baikal all the unexplored field he will need for years. No elaborate equipment is necessary: the village boys do wonders with a few feet of string and a bent pin; whereas the son of the governor-general at Ipkytck (pronounced Irkutçk), who came along with a 200-ruble outfit, and who had read up a petty library on fishology, and expected to stagger the benighted natives with his piscicultural hauls—this "know-all-about-it" book angler had such poor luck he wasn't above resorting (in his despair) to the subterfuge of buying up some of the villagers' bent-pin catches, and returning to Ipkytck and proudly showing them off as his own!

Silkworm gut is always useful in an angler's outfit—not alone for deceiving the cutest of fish, but also as a surgical ligature in case of need, or as an auxiliary guitar or violin string; or as forming the strongest emergency binding twine one could have. Therefore some of it could advantageously be carried by any sportsman visiting the land of dreadful distance.

Incidentally, I might mention that the process of manufacture of silkworm gut was unknown to the world till I made it known over a dozen years ago. In '88 I was traveling in Iberia, where (in Murcia) the making of the gut had always been a mysterious secret; and a letter came from R. Marston, editor of the Fishing Gazette (London), asking for an article telling all about the process. I got the information first-hand, personally handled much of the silvery-pearl threads, but decided to write out the account when it suited me, and to take my own time thereover; returned to America for six months, but did nothing; returned to Paris in the spring of '89, and from there wrote out "The Manufacture of Silkworm Gut." It duly appeared in one of the issues of the Gazette for May or June, and was credited world-wide for years. The last time it turned up was in a Chicago journal of technique, in May, '96. A couple of years after my first publication, the Carswell & Imbrie concern, Manhattan, came out with an independent account. "The cat was out of the bag," etc.

The Black Snow of Cibiria.

This phenomenon of nature was commented on by the writer when describing another of nature's little known phenomena in Cibiria, *re* the cold-expansion of metals, illustrated over a couple of years ago in the monthly Engineering Times (London). The curiosity is not unknown in the north of America; but in northern Asia you see it on a big scale—here and there, whole patches of a funereal black. This is the cause of the singularity: The earth in parts is an intense bluish-black. We all know that a deep blue-black looks blacker than a pure black. You will notice this in print: a circular printed in a pronounced blue-black is an intenser black (and is easier to read) than one printed with plain black ink, which, on drying, has a tinge of a dull gray in it.

Now, the blue-black earth of sections of Cibiria is first frozen by the cold, then the dry cold—getting intenser—dries every particle of moisture, and the clods of earth disintegrate to an almost impalpable powder. The result is you will occasionally see dust storms in Cibiria, in midwinter—in districts where scarce any snow falls—as dense as on the Mojave desert, and intensively more disagreeable—since accompanied by, maybe, a cold of 35 below centigrado.

Finally, along comes a blizzard of snow. For a couple of days there is a pretty churning up of those earth particles and the snow flakes—or rather snow crystals; for the vise-like cold freezes the flakes into powder-like granules ere or almost as soon as they reach the earth. The result is a layer of black snow, from two to six inches deep. Take some of it in your hand: the result of melting will leave some dirty water in your palm, but no sediment—proving how thorough has been the atmospheric mixing of earth and snow. But, while the black snow, melted, will hold the earthy particles in solution for some time, if you melt a whole tumblerful, you will find in the morning the law of gravity will "a tale unfold"—and there will be the earthy sediment.

There is nothing whiter than snow, and its intense whiteness is due to the bluish tinge of the flakes or crystals. Don't our own housewives insensibly copy nature's snow when, to whiten linen, they run the cleansed goods through the bluing tub? I mention the well-known whiteness of snow, as it is this very bluish tinge which, combining with the bluish-black earth, helps produce a snow which is the *blackest thing in nature!* I put it in italics—for there could be nothing blacker. The nearest approach to it artificially is the black crêpe common at funerals. The black snow is not a glossy or glittering black, but has quite a somber or dull appearance. It has not at all the look of dirty snow—too black for that.

There, as it lays in patches on the great steps of western Cibiria, hardened down by the cold so you can walk on it with scarce leaving an impression, you will notice the wind has gently furrowed it as the waves furrow sand on the seashore. This queer wavy or ribbed effect at once puts you in mind of and makes you compare it to the intense dull black of crinkled or fuzzy crêpe which widows like to wear.

Sportsmen's Accommodations in Cibiria.

It goes without saying, these are unsatisfactory everywhere. Judged by western standards, there is not a proper hotel in the country. But all outing people expect to have to rough it even in America, when camping out, but look forward to the town for "getting even" in creature comforts. In Cibiria, the outer must expect to rough it both in town and out of it. If he goes there prepared for thus roughing it, he will feel no disappointment. If he keeps to the line of the railway, he will find at all first and second class stations a respectable pectopaн (pronounced restoran), sometimes called *byfet* (meaning "beefsteak")—for the American or British beefsteak is well known in Cibiria and Russia—in fact, the world over.

The prices are soaring. For a glass of tea, 10 koneks (pronounced kopeks); coffee, 20 k.; cacao, scarce obtainable, but price would be about 25 or 30 k.; glass milk, 10 k.; apple, 25 k.; orange, 30 k.; lemon, 40 to 50 k.; beefsteak, 35 to 50 k.; ham and eggs, 50 k.; a little bread, 10 k.; cigar, 20 k.; champagne, about 7 pybli the bottle. Legally, the konek and pybl (pronounced rubl) equals our dollar and cent; in exchange, the pybli is worth 75 cents and the konek about ¾ cent. The currency is paper, some silver, and old cumbersome coppers. The silver is heavily alloyed with tin, and scarce rings like silver. Altogether, it is a depraved currency. There is false money, too, and it behooves one to be on the alert. I was victimized, as at first I thought all the silver false, and some that were really false did thus creep in. Not wishing, when I found out the fraud, to palm it off on others (which is wrong both legally and morally—beside, consider the awkward assumed look of innocence you have to put on when the proffered spurio is detected and returned to you)—all false money I received in Cibiria, I would deposit, in a spirit of the purest philanthropy, in church collection boxes.

Hotels in Cibiria have a fixed tariff posted in every room. You do at least know about what you will have to pay. The tariff is drawn up by a paternal administration thousands of miles away, at St. Petersburg. Thus, if you want hot water, you can have the piping samovar brought in: 10 koneks. The tariff is rated fairly high; but those printed figures prevent disputes.

"Sweet Repose, Indeed!"

At some of the Chino-Russian inns on the Manchuria-Cibiria frontier, the proprietors have yielded so much to Western ideas as to provide rough cane bedsteads for guests, instead of the straw mats most commonly used. They are made of a wizened or crinkled or very withered-looking gray cane, jointed like bamboo, but solid all through, and not liable to split like the hollow article. The fiber is of the toughest. I used to wonder what it was, especially as the boys about would surreptitiously slice pieces off the bed posts and chew them up. I tried, too, and found it sweet as maple sugar.

It transpired that the material was nothing other than desiccated or sun-dried sorghum sugar cane—chosen for its lightness, elasticity and exceeding strength when dried with its natural juices retained; also insuring to sleepers the sweetest of repose.

So, if you desired some candy when abed, all you had to do was to slice off and munch a little chunk of bed post!

Solitude of Travel in Cibiria.

Some years ago, when touring among the Pyrenees, and, later, among the Sierra Madre range of western Mexico, I recorded my impressions of the solitude of travel in a world which is said to be "getting full." On the Iberian slope of the south-central Pyrenees, three days' jaunt with scarce seeing a soul—and this is supposedly "crowded Europe"! In the land of la Mexicana, forty miles of riding on a straight road—one of the main mesa highways of Mexico—without seeing life! But I had not seen Cibiria then!

"The Seven Cardinal Sins."

There is one spot about midway on the Amur River, where from village to village is some 300 versti (say, in round figures, turning 200 miles). Not a soul to be seen between, outside of the lonely posting stations, or cтaнcias (pronounced stancias). At those stancias reside the starosta, or storoj (chief), his family, and a helper. Day after day you travel without seeing life en route, excepting an occasional fleeing wolf or young deer, or the wildest of goats. The road is tortuous at times, travel slow, but the scenery ravishing in its poetic effects of distant prospects and vast horizons.

All travelers express themselves satisfied when the last of the seven solitary stancias are passed. They have given to the isolated seven, the never-forgetable title of "The Seven Cardinal Sins." Nor will the occidental tourist forget it if (as happened to the scribe) he gets benighted between those solitary stations—has the tarantas or harness break down seven miles from the stancia you are trying to reach ere the pitch-black night comes on: the *isvochik* (driver) has to tramp those seven miles to the stancia for a new belly band or shaft or axle (mostly made of wood), or for whatever the breakdown may mean; then there is the seven miles to come back for you, your baggage, and to haul the tarantas to the stancia. Going and returning will

AS HIS FATHER DID BEFORE HIM

.ake him about six hours; meanwhile you are left to compose yourself among your furs in the vehicle, and listen to the moaning winds, and an occasional uncanny, stealthy creeping in the black forests, which will make you ask yourself with a shudder, "What can it be?" Verily, when the isvochik thus goes off, you feel, as never before in your life, that "he leaves the world to darkness and to me."

Of your own language, kith or kin, you will meet with very few in Russiadom. During the two years of travel between the Pacific and Polonia, I only accidentally met two such travelers. One was Dun, a mining placerist from the Golden Gate; the other, Alexander, a London mechanic. Both were rush-across-the-country tourists. The Britisher wrote a couple of papers for the London Field, entitled "Two Thousand Miles in a Sledge." They were stuff—replete with ludicrous errors!

The impressions of the rush tourist are naturally unreliable. The most recent errorist is H. Norman, whose book, "All the Russias," smacks very much as if the author had joined Fontanka kanal's big army of subsidized foreign official excusists. The publisher thereof (Heinman, London) was, it will be remembered, the same who marketed and exploited the Landor imposture.

Sporting Footwear in Cibiria.

The Cibiriaks have copied and adopted permanently for winter use the Tatar felted camel wool boots. On the dry winter snows, they are superb: the soles are also of the same felted material, double thick. They are the best insulators known against cold. But of course they are not waterproof, and with the disappearance of winter, they disappear too, and are replaced by leather top boots. Rubbers or gum boots are seldom seen in Cibiria, because, while keeping out wet, they also keep it in—in the form of perspiration, and are icily cold in winter and distressingly warm in summer. Rubber, in fact, is such a poor nonconductor, that, profiting by experience, I have entirely rejected it from present and future outfits for footwear.

In summer, the Cibiriak sallies forth in leather top boots, which are provided with extension tops. The poorest of mujiks provide themselves with itchigi (spelt as pronounced)—a grotesque-looking top boot, dreadfully clownish-looking, made of rawhide, painted with tar. For a sock, they stuff dried grass inside. For light wear, they use bark sandals, but these have no stability—the soles going to shreds after a couple of weeks.

I have run the whole gamut of Cibirian boots—and more: had pure cork-sole boots specially made (although cautioned not to), and split them like sealing wax within ten minutes of putting to a practical test.

In summer time, the best boot in the world is—no boot at all; in wet and wintry weather, the waterproof leather boot "can't be beat"; but for dry weather use, the Cibirian coarse camel-wool boot is unexcelled.

The Penns of Cibiria.

For the projected book of travel in Cibiria, I had penned down data on the Penns of Cibiria. As the work, however, promises never to materialize, unless issued as a successful failure, or economic loss, I might as well condense the matter into this paragraph. It will interest Americans, and especially Keystone Staters.

In April, '97, I ran across at Cipoctah (pronounced Ciroçtan), on the topmost Asiatic slope of the Ural divide, a family whose name was spelt in Russian letters—пенн. This is pronounced like our own Penn. Inquisitive, I began to investigate, and followed up the theme till I located the source of the Penns in the town of Ekatepiнbypr (pronounced Ekaterinburg). From there there is a jump of 3,000 miles further into the heart of Cibiria—to the stancia of Kokyi, on the za-Baikal, where another Penn branch is located. They came to Cibiria from Russia less than a hundred years ago, and to Russia from the south of Britain, from the old William Penn stock of Buckinghamshire. As a boy, in some of my earliest vagrant travels, I visited the grave of Quaker Penn at Jordans, near Chalfont, in the shire of Bucks—it is almost as remote to-day from the madding crowd as it was when Penn was interred there nearly 200 years ago.

The Cibirian Penns are naturally by this time completely Russianized. A few speak the French language, as is common with all Russians of culture; only one has a definite knowledge of the American language. It is a very limited, but sympathetic and laborious family; they do not call themselves Christians, but *prabo-çlabni*, meaning, literally, "verity-faithists"—or "true-faithists."

Roads a Quarter of a Mile Wide.

There are some portions of the 5,000-mile highway that stretches from the Amur to the Vistula that average a quarter-mile in width. These expansive tracks are only found hereabouts, on the za-Baikal. The abnormal width came about in this way: Stretches of country are a hard gravel soil—so hard, that the road makers made little or no attempt to even define a made road over it. It was considered "good enough." So, not even a track being defined, the myriads of caravans and coaches which have passed over the route every month for a half-century, have chosen any part of the hard expanse, and (having broad road-making tires) have cut out what must be the broadest natural-made roads known. A dozen tarantases could easily race abreast, yet have the amplest latitude.

Safety of Travel in Cibiria.

During two years' journeying across Cibiria and Russia, never a single molestation from man or beast (two minor exceptions). I never once saw a wolf or a bear, although some mornings their tracks were visible on the fresh snow across the highway where they had crossed it from one forest to another. I always had my .45 five-shooter ready for an emergency, however; and twice had to use it on threatening starving wolf dogs. I would let them come near enough, to test their behavior, watch them narrowly, and just as they intended to spring, would shoot the foremost point-blank in the breast. They fell over without a sound or struggle—dead. A fine death! The others, jumping at the report and seeing the result, would hurriedly skulk off into the forest.

I had been told some weird stories by Russians themselves of escaped criminals, who were ever and anon "murdering isolated wayfarers" for their money, especially near villages. Now, although I traveled, as stated above, two years alone—some in the lonesomest parts of Cibiria and Russia—I was never once interrupted. I have seen strange characters disappear in the woods, or wait till I had passed, but maybe they thought I was myself a dangerous brigand, since being alone. For it appears that among the desperate classes all over the globe, the isolated criminal is feared as the most redoubtable, just as in the animal world the rogue elephant is, in its solitary life, reckoned the toughest by sportsmen.

L. Lodian.

[TO BE CONTINUED.]

In Nez Perce Days.

Kipp, Mont.—Mr. E. W. Buckwalter, or Buck, as he is familiarly called, is one of Montana's old timers. He crossed the plains in 1863, and since then has had a most varied experience, having been at different times a typesetter, a miner, a bull-whacker, a merchant, a wood-hawk; he is now a prosperous rancher.

One evening recently we were talking about the Nez Percé war of 1877, when Buck came in, and some pilgrim asked him where he was during that exciting time.

"Where was I? Well, I'll tell you," he replied. "It has always been my luck to get mixed up in any row going on; I walked twenty miles to stumble into that one, and for a little while those Indians made things pretty lively for us. During the '70s, when steamboating on the upper Missouri was at its height, I had a wood yard a couple of hundred miles below Fort Benton, at Two Calf Island. I was right at the foot of a long stretch of shallow, rapid water, and every steamboat passing up bought all the wood of me that could be loaded on, for there was never any telling how many hours, or even days, it would take to get over the frequent bars. In the fall of the year, when the water reached its lowest stage, the boats went no further than Cow Island, twenty miles above my place, from whence their cargoes were hauled overland by bull and mule train to Fort Benton.

"In the month of October, 1877, the river was unusually low; I did not think there would be any more boats up that season, so one day, feeling rather lonesome, I thought I would walk up to Cod Island and visit the little detachment of soldiers and the citizen or two who were in charge of the freight left there by the last boats. I slung my rifle over my shoulder and started off on a game trail which led along through the bottoms and over the hills. It was a pretty wild country in those days and we woodhawks were exposed to no little danger from the war parties of different tribes who were continually prowling along the river in search of scalps and plunder. So I kept my eyes open as I went, and not a deer moved in the brush, nor a living thing of any kind came into view but what I stopped and made up my mind just what it was. Along in the afternoon I came in sight of Cow Island, and was surprised to see a large party of Indians, men, women and children, fording the river to the north side, and driving a large number of loose horses before them. I couldn't imagine what tribe it was; I had heard of no movements of the Indians, and so far as I knew there were none at open war with the whites. But I had long since learned by dear experience that discretion is the better part of valor, and I turned to go back. I only went a few yards, however, when I saw some Indians coming down the ridge on my trail; there was no alternative but to go on, and on I went, walking as fast as I could and yet not show indecent haste. All the same I was scared. However, I arrived safely at the landing, where I found my friend, Mike Foley, who had charge of the freight, and Sergeant Briggs and ten soldiers, who were guarding it. There were also five tenderfeet, passengers on the last boat, who were bound for Helena and were waiting for a chance to go on with the next freight train. Of course, I couldn't tell them who the Indians were. They had begun a small intrenchment when the first of the outfit appeared, and by the time I arrived it was about complete. I was standing looking at it, when we saw a couple of the Indians sneaking up toward the freight pile under cover of the river bank. Foley and I went out to interview them, and when they saw us coming they stopped and held their guns ready, half raised, a mighty bad sign. When we asked them who they were, one of them replied: "'No kum-tux.' a Chinook word meaning: I don't understand.

"Then we knew that they were from the west side of the Rockies, for the plains tribes do not speak that jargon invented by the Hudson Bay Co. We asked no more questions, but simply stood and looked them steadily in the eyes, and presently they turned and walked slowly back down the river.

"There happened to be a case of Winchester rifles and some cartridges among the freight, and under the circumstances the sergeant thought he was justified in using them; we carried the boxes into the intrenchment and pried off the covers.

"'Here,' said the sergeant, 'you tenderfeet may just as well understand right now that there's going to be trouble in this camp to-night; you've got to put up a good fight or die, and the chances are you'll die, anyhow. Everyone of you take one of these rifles and a box of cartridges and do your best when the time comes.'

"One big, strapping Irishman, a carpenter by trade, refused. 'Be jabers," he said, "Oi niver handled wan av thim things in me life, an' oim too auld to larn new thricks. Jist give me an ax or a good shilalah, an' I'll do me share if they do be for makin' a charge.'"

"About five o'clock a party of the warriors came riding toward us; they all had their guns resting handy across their saddles. When only twenty-five or thirty yards distant the sergeant called out that we would fire if they tried to come nearer, and they stopped. A fellow who looked like a half-breed, who was with the three chiefs, a little in front of the rest of the party, called out in broken English that they wanted to talk, so Foley and I went over to hear what they had to say. I looked closely at the three chiefs while face to face with them, and afterward, when I saw their pictures in Harper's Weekly, I knew that I had met Chief Joseph, the noted and cunning Nez Percé leader, and his bloodthirsty aids, White Bird and Looking Glass. First they wanted to know if we had any whiskey, and we replied that there wasn't a drop in the outfit. Then they wanted some bacon; we said there was none of that either, but that if they were hungry they would find thousands of buffalo only three or four miles further north, which latter was the truth. That news seemed to please them and they turned and rode away.

"The freight pile, some sixty tons of miscellaneous goods, including about twenty tons of bacon, was near the river bank and directly under a high rocky ridge. The earthworks so hastily thrown up were some little distance from it, but were also overlooked by the ridge. The defense should have been constructed out in the middle of the flat, but when the boys began it they didn't really believe that there would be any attack, seeing there were women and children in the outfit, and, again, it was their duty to remain near the goods they had been sent to protect. But shortly after the talk with the Indians, we knew for certain what we had begun to suspect, that we were in for a fight, for a wood-hawk sneaked in from up the river, and told us that a soldier carrying dispatches to the Cow Island detachment, had been killed by them near his cabin that morning, the Indians taking his horse, gun, and accoutrements.

"'Well, fellows," said the sergeant, 'night is coming on and there's no doubt we're in for it. Let's have a bite to eat, for fear we never get another chance at the grub pile.'"

"He was a brave man, that soldier, and would have his joke no matter what was going on.

"We all pitched in, when all at once the Indians opened fire on us from the ridge, and dropping our meat and hard tack, we rushed into the trench. Before we got there one of the tenderfeet was shot; the bullet first tore away one of his thumbs, and then striking a rib, glanced along the bone for several inches, making a painful but not dangerous wound. He gave an awful screech when he fell, and one of his comrades was so badly scared that he dropped his gun, jumped the breastworks, and fled into the willows bordering the river. The bullets were plucking about us like hail, but we ran back to the wounded man and carried him into the trench. It's a wonder none of us were hit then. The breastworks were so low, and so near the ridge from whence the Indians were shooting, that it was with the greatest difficulty we kept from exposing ourselves to the terrible fire.

"As soon as it was dark the enemy broke into the freight pile. They found a few gallons of whiskey, barely enough for a drink around, but no ammunition, as we had taken that. There was lots of plunder, however, which they carried away, and then they set fire to the rest. The burning bacon gave out such a bright flame that the whole flat and the ridge were illuminated, enabling us to see what was going on, as well as affording the Indians plenty of light to keep up their accurate fire at our breastworks. They kept at it all night long, and charged us twice, but each time we drove them back without any loss on our side. We never knew whether we actually killed any of them or not, for each time they carried their wounded back with them. If we did, the bodies were so carefully concealed that they were never found. Perhaps they were weighted and cast in the river.

"About three o'clock in the morning, when the Indians made their last charge, I got a bullet through the shoulder which paralyzed my left arm for the time being, and as I was of no further use as a fighter, I crawled into a hole and covered up with some buffalo robes owned by the soldiers. At the edge of the hole, near my head, stood a large army mess-box; all the rest of the night I could hear the bullets plugging into it, making sieves of the tin dishes and cups it contained. After the fight was over we found that it had been pierced more than two hundred times! It was fully eight o'clock when the Indians ceased firing at us and moved away up the flat. Soon after they had gone our deserter appeared and said that they had been all through the willows during the night, and several times nearly stepped on him. He was awful hungry, he said, and would like something to eat. The sergeant cursed him roundly for being such a rank coward, and then gave him a piece of raw bacon and some hard tack. As soon as he got them safely in his hands, he leaped the barrier again and ran toward the river. Just to help him along the boys fired a few shots, the bullets plowing up the ground on each side and in front of him. Well, 'twas laughable to see his antics; he hollered and srieked, fell down and rolled a way, got up and ran, and then rolled some more; but all the time held on to his hardtack like grim death; and so he went until he finally disappeared in the willows.

"About an hour after the Indians left us we heard some heavy firing up Cow Creek, and pretty soon Cooper and Farmer, with their teamsters, came into camp and said that the Indians had captured and burned their wagon trains with all the valuable freight they contained, they barely escaping with their lives. About the same time a woodhawk, who had a yard below mine, arrived; the outfit had burned his cabin and he only got away by taking to the willows. He reported a steamboat aground at Grand Island, only ten miles below.

"As the tenderfoot and I were both suffering from our painful wounds, it was decided to take us down to the steamer in a skiff owned by Foley. We were about to push out into the stream when some more of the enemy appeared on the opposite side of the river, traveling east, and we thought it best to remain where we were until dark. As soon as night came we started again, and after going about a mile heard some horsemen talking English on the south shore. They were some Fort Benton volunteers led by Col. Ilges, and were after the Nez Percés. Among them were Charlie Rowe, Col. Donnelly, Judge Tattan, George Croft, Murray Nicholson and a number of others whose names I do not now recall. Louis Cobell was their guide. They told us of the awful bloody trail the Indians had left behind, of the battle of the Big Hole where so many of our soldiers were killed, and we in turn gave them what information we had, and showed them the ford, which they were looking for.

"A little further down the stream we were hailed again, and who should it be but the tenderfoot who had twice jumped the breastworks. He was still so badly scared that he could scarcely speak, and when we told him he could get aboard he came over the side in such a hurry that the skiff nearly capsized. Some one gave him a thump on the head with an oar and told him to keep still or we would drown him.

"We arrived at the steamboat without further incident. The next morning she got off the bar, but the water was so low it took us four days to make the ten miles up to Cow Island. Then we learned that the Fort Benton men had followed the Indians up Cow Creek until they found

their rear guard posted in a commanding position across the valley. A fight ensued, in which a man named Bradley was killed and the little party was forced to retreat, the Indians greatly outnumbering them and having all the advantage of defense.

"It is a matter of history how Gen. Miles finally rounded up the nez Percés near the Bear Paw Mountains. That was only a few days after they made things so lively for us at Cow Island."

Javanese Notes.

WHILE in Melbourne I made the acquaintance of a person recently arrived from Batavia, who informed me that in the zoological garden at that place there was a young Javan rhinoceros, which was for sale. Very naturally I was anxious to procure such a rare specimen, therefore pushed the collection of Australian fauna with all possible dispatch and took passage in the first steamer for Batavia. We passed up inside the Great Barrier Reef, making a day's stop at Somerset, Torres Straits. As we steamed into the harbor, I noticed several small craft lying at anchor, and on inquiry was informed that they were pearl fishers, with mixed crews of Caucasians and South Sea Islanders. They all hailed from Sydney, where their owners had fitted them out, giving the crews a percentage of the finds, which were mainly pearl shells. Just before we steamed out of the harbor, a rowboat came alongside, and as I happened to be standing near the gangway, I was accosted by the steersman, wishing to know if he could be favored with a late Sydney paper. Answering that I had several in my stateroom, which I would gladly present to him, if he would come on board. I piloted him down into the cabin, and slyly ordered the steward to bring a bottle of brandy, which was duly served while I was handing over the papers. As he seemed to enjoy his drink so much, I determined to give him a chance to finish the bottle at his leisure. Pretending to go into my stateroom in search of more papers, I passed into the steward's sanctum, gave him orders to roll the bottle up in a bit of paper, pass it down to the crew of South Sea Islanders, and say it was for the skipper. Keeping in my quarters long enough to give the steward time to do as ordered, I reappeared with a second batch of papers, accompanied the skipper on deck, and saw him start for his little craft, after a profusion of thanks. When he reached his vessel, he sprang on board and started for the cabin, when he was stopped by the violent gesticulations of one of the boat's crew, who passed up the bottle of brandy. He waved it toward me, rushed below, instantly reappeared and gave some orders to the crew, who immediately pulled toward the steamer with all possible speed. Our screw had begun to revolve when they got alongside, and tossed a parcel on deck, which, on opening, proved to be five pounds of magnificent tortoise shell, some of which is yet in my possession, in the shape of a toilet comb and a cap brim.

We passed into the harbor of Batavia just about dusk, and by the time we had passed the health officials it was quite dark. One other passenger accompanied the captain and myself on shore, where we hired gharrys and started for the European or modern portion of the city, where the hotels are situated. Our route passed through the Chinese quarter with its streets completely illuminated and thronged with people, which the captain explained by informing us that it was the week of Chinese New Year. On our arrival at the hotel the captain left us, in order to drive further up the city to the residence of his agent. I smoked a cheroot, was shown to my room and had just stretched out for a good night's rest when I heard the noise of wheels in the courtyard of the hotel, and immediately afterward was requested to get up and go to the office, where the captain wished to see me. On so doing, he informed me that he had learned, through his agent, that one of the steamers of his line had been wrecked, consequently it would be necessary for him to reach Singapore as son as possible, in order to make an extra trip in place of his unfortunate consort. Therefore I would have to hurry on board with him, gather up my luggage and get back on shore as soon as possible, as it was his intention to get up steam immediately and head for Singapore. I climbed into the gharry with him, and on our arrival at the pier it was some time before we could procure a boat. With the aid of a native policeman, we finally succeeded in getting one, and pulled out to the steamer. I hastened below, bundled up my traps, and on returning on deck was thunderstruck to find that the boat had gone ashore, as the captain, in his hurry, had forgotten to hold it for me. He proffered to man one of his boats to send me ashore, but I saved him the trouble by making out in the approaching daylight the hull of a vessel anchored not a great way from us. Pitching my luggage into the gig, which had not been hoisted on board, two of the crew pulled me off to our neighbor. On drawing near I made her out to be an English steamer with several native boats at her gangway, evidently soliciting jobs. Hailing an officer, who was standing on the poop, I explained my dilemma, whereupon he stepped to the bulwarks, spoke a few words in Malay to the parties in one of the boats, and directed me to make a transfer to it. Hastily following his directions, I found myself heading for the shore, while the gig returned to the steamer. The officer kindly shouted the amount I would have to pay for the service, for which I thanked him by a wave of my hat, and in a comparatively short time I found myself again landed in Batavia. Fortunately I ran against a policeman who spoke English, so I had no difficulty in securing a gharry to drop me at the hotel, from which I had hurriedly departed a few hours previous. Notwithstanding having lost an entire night's sleep, as soon as I had finished my breakfast, I hurried out to the zoological garden, and was annoyed to ascertain that young Jamrade had purchased the rhinoceros and started with it for London. Returning to the hotel, I dropped asleep and did not awake until the time of taking the usual afternon bath and dressing for dinner.

After dinner I took a seat on the front portico, and while enjoying a cheroot, my attention was attracted by the throngs of natives, all of whom were heading down to the Chinese quarter, which called to my memory the captain's remarks on the previous evening, whereupon I determined to join the crowd and endeavor to see whatever was novel and interesting in the observance of the New Year's festival. By simply following the groups of curious investigators, I soon reached the district inhabited exclusively by Chinese, and was astonished at the entire cessation of all kinds of business and the complete yielding of the whole population to conviviality and enjoyment. Every house, from the poorest to the most affluent, was open for the entertainment of acquaintances, while the streets were filled with symbolical floats, montebanks, acrobats, tumblers, etc., and at one place I met a party of three, which forcibly reminded me of the English carol singers. Should I happen to stop in front of the house of one of the poorer class, the occupant would dart out, attach a pack of firecrackers to a bit of bamboo thrust into the pavement, seize me by hand and draw me inside to take a cup of tea, while the noise of the exploding crackers served as a signal for a party of merry andrews to give their performance in front of the house for my especial gratification. If I chanced to loiter in front of the residence of one of the wealthier class, the servants would instantly request me to pass in, where the proprietor insisted on my imbibing something, from beer to champagne. I spent several pleasant evenings wandering about taking in the sights, but on the last night of the festival underwent my most singular experience. Finding that nearly every one headed in the direction of the Chinese captain's residence, which had been pointed out to me on a previous evening, I followed the crowd, and soon found myself in its vicinity. A cordon of native police kept quite an open space in front of it, which, a few moments after my arrival, was filled by the conveyances of a lot of Dutch officials, who had evidently called to pass the compliments of the season. After delivering their loads, the carriages were driven off, while the police still kept the space clear, and I pushed my way up close to them, in order to obtain a good look at the officials, who had ascended to the upper portion of a portico, which extended along the entire front of the house. In my eagerness, I pressed against one of the police, who, looking over his shoulder, detected me, and immediately beckoned to one of the group of servants, who stood at the entrance. He answered the signal, exchanged a few words with the policeman, went into the house and soon returned, spoke to the officer, who immediately signed for me to follow the servant. I did so, and on reaching the doorway was received by the master, who spoke excellent English, informing me that the party above were the Governor General and his staff, who were paying an official call, and of course he was obliged to show them every attention. Therefore, I would have to excuse him for a short time, but so soon as they took their departure, he would endeavor to make amends for his seeming incivility. Turning me over to one of his head servants, he hurried off, while I was piloted to the far end of the portico, seated at a small table, and speedily served with a pint bottle of champagne and a bundle of cheroots. Then commenced a regular Mardi Gras parade. In honor of his guests, the Captain had hired all the floats, rare shows, jugglers, acrobats, etc., which had filled the neighboring streets, to pass in procession in front of his residence. It was headed by an enormous fiery dragon, about a hundred feet in length, and spitting a mass of flames every few steps. It had more legs than a centipede, and I wondered how many Chinamen were hidden under its flame-incrusted cuticle. At the end of the parade, the officials bade the host a ceremonious adieu, who immediately took a seat opposite to myself, ordered additional refreshments and endeavored to make himself as agreeable as possible, and I am perfectly willing to acknowledge that he made a success. At the conclusion of our chat, he insisted on my acceptance of the use of his private gharry for conveyance to my hotel.

The next morning I concluded that I had spent about as much time as could be spared in giving attention to sights which were new to me, and determined to busy myself in trying to find out if there was any possibility of obtaining what I had originally wished to procure—namely, a living specimen of the Javanese rhinoceros. By dint of persistent inquiry, I learned through our consular agent that the most likely person to render me assistance was the landlord of a hotel at Buitenzorg, a village some thirty-five or forty miles from Batavia by railway. Taking a morning train, I was surprised to find that it was officered entirely by native Malays. At a later date I visited the workshops of the road and found them filled with the same race, who were performing all the labor, mechanical and otherwise, under the supervision of Hollanders. I found the landlord at Buitenzorg was an Italian, who had left home in his youthful days and wandered to New York, San Francisco, Japan, India, and finally to Java. He was a most enthusiastic sportsman, and usually made one or two trips yearly well into the interior, in quest of large game. He immediately proffered to do all in his power to assist me, and suggested the propriety of starting several runners in various directions to try and ascertain the whereabouts of a mother and calf rhinoceros, as it would be necessary to kill the mother in order to capture the youngster. Being convinced that his advice was correct, I authorized him to immediately engage and start the scouts, while I returned to Batavia, in order to arrange with my banker for funds to use during my expedition to the interior. Calling at his office immediately after my arrival in the city, I was sorry to learn that he was absent, and not expected to return for some ten days, therefore was compelled to remain quiet until his return, consequently devoted myself to an investigation of Javanese life, which proved to be entirely different from anything I had ever experienced in my wanderings.

The first novelty that struck me forcibly was the peculiar mode of hotel life. To use an Irishism, my chamber maid was a man, who not only performed all the duties about my bedroom usually discharged by a female, but also waited on me at the table. Every article which I used in taking my meals was kept on a small table in my room, and carried to the dining hall at luncheon and dinner hours. My breakfast was served to me individually on the portico in front of my quarters. I afterward found out that every article I used was counted out to my servitor, and he was held personally responsible for them. Much to my surprise, I discovered that the flavor of the coffee was unpleasant, which was a disappointment, as next to Mocha I had always considered Old Government Java a most palatable beverage. But a short time elapsed before I found a reason for the unpalatable taste. I was drinking new instead of Old Government Java, which I had been accustomed to imbibe. The first forenoon I was startled by seeing the lady guests passing about in thorough deshabille, being dressed in complete Malay costume of sarong, etc., with stockingless feet thrust into slippers, and the hair hanging loosely about the shoulders. When I saw how they suffered from the heat at the dinner table when dressed *à la mode,* I was perfectly willing to acknowledge the sensibility of their morning costumes. In passing through the bar room, my attention was attracted by a sign of "American Cocktails," hung in a conspicuous place. I immediately ordered one, and was astounded when the barkeeper, who was a Chinaman, compounded an eggnog. Turning to the landlord, who was a German, I asked if that mixture was what he called a cocktail. On being assured that it was, I proffered to teach him how to concoct a genuine one. He instantly assented, and with the help of some Angostura bitters and French brandy, I brewed two, one of which he imbibed, and in a trice ordered the Chinaman to use my recipe henceforth, as the eggs enhanced the cost of those previously dealt out. In wandering about the city, I was unable to detect a cellar, as all the buildings stand on brick or stone pillars, thus affording a free circulation of air underneath, for the purpose of cooling the floors. Even the Bank of Java stands on brick pillars of sufficient height to allow the gharrys of its customers to drive underneath and remain in the shade while the owner is transacting his business on the floor above. It struck me that such construction was a direct invitation to burglars, which I afterward discovered was checked by the presence of an armed posse from 3 P. M. until 10 A. M. Strange to relate, one of my most singular experiences happened in this building. So soon as my banker returned, I hastened to his office, in order to make the financial arrangements for my proposed trip to the interior. On my informing him that it would be necessary for me to carry quite an amount of small change, in order to pay my expenses while among the natives, he told me that it would be impossible to get it, as it was so very scarce that the bank refused to supply their best customers, even at a high rate of premium. Somewhat crestfallen on receiving this bit of unwelcome news, I determined to leave no stone unturned, in order to accomplish my purpose. I begged that he would send one of his clerks with me to the bank, in order to be properly introduced to its officials. He instantly assented, and ordered one of them to accompany me. Handing me a cheque for the amount I wished, he wished me success, but expressed a fear that I would make a failure. Jumping into a gharry, it was but a few minutes before we reached the building, and on entering I was surprised to find that all the tellers, etc., were Chinamen. On being shown into the cashier's room, I found myself face to face with another one. After being duly introduced by my companion, the Celestial politely inquired my errand. Handing him the cheque, I explained to him how necessary it was for me to be well provided with a quantity of small change for my proposed trip, and would esteem it as a great favor if he would let me have it, and I would willingly pay whatever premium he might see fit to charge. He laughingly replied, "I heard of your arrival and proposed trip, and was sure that I would have a chance to bleed you financially before you could get away. Come out to the paying teller and we will see what can be done for you."

Passing out of the office to the teller's counter, he said: "Give this gentleman all the small change he wishes in cashing this cheque, and don't charge any premium for it."

Before I could recover from the amazement caused by his generous action, he had darted into his private office and closed the door, thus preventing any heart-felt thanks. In spite of my amazement, I could not prevent a smile at the startled appearance of my companion, and at the same time, a thought flashed across my mind of how I would have been served, in like circumstances, in my native land. Having thus fortunately gotten rid of my principal hindrance, I hurried off to Buitenzorg (*Sans Souci*) to confer with Ferrari about the details of my proposed trip, and was disappointed to learn that none of the runners had returned, therefore was compelled to tarry until they should put in an appearance.

I found Buitenzorg well deserved its name of "without care," as it was beautifully situated on much higher ground than Batavia, and regularly frequented as a health resort by the inhabitants of that torrid city. One of my favorite resorts was the botanic gardens, said to be the finest in the world, and immediately adjoining which is the residence of the Governor General of the Dutch East Indies. Every afternoon I spent several hours wandering about and feasting my eyes on the wealth of tropical vegetation, contained in this unequalled repository, and one of my favorite strolls was through a magnificent avenue of the famous Upas trees. During my sojourn in Adelaide, South Australia, I had been taught by Dr. Schomburgk, superintendent of the Botanical Gardens, and brother of the discoverer of the celebrated *Victoria regia,* how to fix upon the hour of bloom of that wonderful plant, so that each afternoon I would seat myself alongside one of the many ponds containing specimens of this strange flower and enjoy its delicious perfume, which only lasts but a few minutes after blooming.

One evening, just after dinner, while I was sitting on the porch in front of my room, enjoying a genuine Manila cheroot, Ferrari introduced a gentleman who expressed a wish to have some private conversation with me. So soon as the landlord retired, he informed me that he was the agent for a firm in London, which made a specialty of dealing in orchids, and that he was in search of a species; only one specimen of which had ever appeared in market, which had died soon after its arrival. He said that he had wandered all over India; even to the highest portions of the Himalayas, through Ceylon, Malacca and Sumatra, without discovering a trace of it, and learning from the landlord that I was somewhat of a globe-trotter, he was in hopes that I could give him some information that would be helpful in his quest. I promised to take him the next day to that portion of the Botanic Gardens, which was devoted to them, so that he could quietly investigate the collection without exciting any suspicion of his intentions, as he did not wish from financial motives, that any one should divine his business. The next morning I proposed that we should first examine the different species on the trees in the grounds of the hotel, and had nearly finished our search when I pointed out one, which he had hastily passed, without attracting his attention. He gave a shout, and started to

execute a war dance, exclaiming, "That's it," when I suggested the propriety of keeping quiet, or his mission would be revealed. He instantly saw the cogency of my advice, and after talking the matter over we concluded to take the landlord into our confidence, with the hope that he would suggest some way by which the specimens could be secured at a reasonable price, without exciting any suspicion of their real value and destination. Luckily, he suggested a scheme, which was worked out successfully, without any one conjecturing the true issue. He proposed that he should be the only person who should appear in the transaction to the natives whom he would employ to collect the plants. The affair ended in his engaging three Malays to bring him three hundred plants similar to the one shown them, at thirty cents each. Now, as it takes two and a half or their cents to make one of ours, it was a mystery to me how much the contractors really paid for the plants as they delivered them in forty-eight hours; having evidently gone out to the neighboring villages and and hired the inhabitants to collect for them. Happily the agent got away with the three hundred plants, nicely packed in bamboo crates, without exciting any suspicion, and I have often wondered how much they brought on their arrival in London.

In the meanwhile, the scouts returned, and one of them reported the discovery of a female rhinoceros and young one in a locality favorable for capture. We immediately began preparations for departure, when Ferrari suggested the propriety of visiting the Rajah of the district, in which we proposed to hunt, and solicit his good offices in directing his subjects to give us all the assistance possible in our undertaking. Of course, I saw the wisdom of the move, and we made a trip to Bandong, where the Rajah of the Preanger District resided. We arrived in town early in the morning, and immediately after breakfast Ferrari started for the Rajah's palace, in order to have an hour appointed for my reception. He returned in a short time, and from his looks I divined that he was the bearer of ill tidings. He informed me that on his arrival at the palace he was told that the Rajah was unable to receive visitors, as he was undergoing a period of mourning for the death of a relative, and the Mahometan religion forbade the reception of visitors during its period. Very naturally thinking that our scheme had failed, we were anxious to return to Buitenzorg as soon as possible, but found that we should be compelled to wait until the departure of the afternoon train. In order to kill time we started out for a stroll through the town, which finally brought us to its outskirts, where my attention was attracted by a handsome space, beautifully laid out with walks, ornamental trees, shrubs, flowers, etc., which Ferrari informed me were the grounds surrounding the palace, and proposed that we should ramble through them. On my acquiescence, we wandered about for about half an hour, when we found ourselves in front of a pavilion, which we entered and found that it contained a couple of fine billiard tables. We were no sooner inside than the keeper, who recognized Ferrari, invited us to try our hands at a game; placing the balls on a table and pointing out the cue racks. So soon as we commenced playing he passed out of doors, and in a short time returned, bearing a waiter, which held a bottle of claret, glasses and a bundle of cheroots. In a short time every window in the building was filled with the heads of a crowd of natives, who seemed to highly enjoy the fluctuations of the game. Suddenly every one of them fell on his knees, and immediately after the Rajah and attendants passed into the door. Ferrari introduced me and acted as interpreter during our interview. The substance of the rajah's remarks was that he felt so much complimented by my visit for the purpose of asking his permission to hunt in a portion of the territory governed by himself, that he could not resist the temptation of breaking one of the most rigid of his religion's decrees and granting the requested interview. That he would cause it to be known that I traveled as his guest, and consequently must be treated with special courtesy. He positively refused to listen to my thanks for his great kindness, and wishing me every success kindly bade me farewell and hastily left the building. Thus, contrary to our expectations, the purport of our visit to Bandong was successfully consummated.

That afternoon we returned to Buitenzorg; hastily made preparations for our hunting trip, and hurried off to the Preanger District. On our third day out we were surprised by being joined by two of the Rajah's servants, with a pair of horses for our especial conveyance. One of the men looked after them and the other never let me get out of his sight, except when I was asleep. I laughingly requested that he would not be so vigilant, but he refused, and said that he had no fears of my suffering from personal violence, but I might unwittingly meet with some accident and then he would be held accountable for it.

The horses were never used and were simply led from one camp to another, whenever we made a change of base. We proceeded by easy journeys toward Sagranten, near which the rhinoceros had been seen, always spending our nights at one of the intermediate villages, where we occupied the rest-house, which had been built for the especial accommodation of the Dutch officials in making their tours through the country. During the afternoon a runner was sent ahead to notify the headman of the village of our purpose to spend the night in his hamlet, and on our arrival we would find everything prepared for our accommodation. On reaching Sagranten we found that the Raden Sastra Soedibdja had made especial efforts to render our sojourn under his roof as pleasant as possible. As several days elapsed before we received notice from the scouts regarding our presence in their immediate vicinity, I passed the interval in wandering about the neighborhood, trying to gain some insight into Malay life. In one of my rambles I had a narrow escape from four native buffaloes. They were out grazing and were attended by a couple of children. In passing I walked to the windward of them, and so soon as they caught my scent they made a wicked charge, in spite of the yells of the youngsters. Fortunately, a convenient tree served as my refuge, and I was astounded to see the tots deliberately climb over the rumps of the animals on to their backs, by using their tails as a help. When they were firmly seated at the shoulders, a series of shouts and whacks with bamboo cudgels caused my assailants to move off and allow my descent to terra firma, with the impression that it was not prudent for a Caucasian to prowl around among such seemingly peaceful creatures.

I was surprised at seeing the number of ways in which bamboo was used for all manner of purposes. For instance, it takes the place of buckets for holding and carrying water. By knocking out all the joints, except at one end, of pieces about four feet in length and swinging them with bits of rattan to the two ends of another smaller piece, carried on the shoulders, they are made to serve as vessels for the transportation of the fluid, and on reaching the dwelling, are leaned up in a corner until empty. I found the Raden in possession of a pack of playing cards, and very desirous of learning some game of which he had no knowledge. On the spur of the moment I thought of solitaire and proffered to teach it to him. He proved an apt pupil and expressed himself delighted at learning a game which he could play alone without being bothered to hunt up an opponent. He became so smitten with it that he spent every spare moment shuffling and dealing out the cards.

Several days passed before we received any word from our scouts, when our suspense was relieved by the arrival of a messenger requesting our presence at a small hamlet only a few miles distant. Hastily following our guide, we soon arrived at our destination, where, in less than an hour, a house was erected for the especial accommodation of the Raden, Ferrari and myself, every portion of which was bamboo. Singular to relate, the roof was the first portion constructed, and after the frame had been thatched with bamboo leaves, it was hoisted up on to the four corner posts, and bamboo mats were hung around, to serve as walls, while the floor was of small bamboo poles lashed on sills of the same material. The edifice was about sixteen feet square, and the only tool used in its construction was the parang, which is a large knife, very similar to the bowie, suspended sword fashion at the side.

We had just stretched ourselves on our makeshift shakedowns for a good night's rest, and I was in the act of reaching for the coal oil lamp in order to extinguish it, when I suddenly became conscious of an abrupt vibratory motion, and was forced to lift it from the floor in order to prevent its upset. Immediately sitting up on my pallet I became conscious of experiencing a violent earthquake shock, which was so severe that it was with great difficulty that I kept in an upright position. Suddenly there was an appalling crash, and the vibration increased for a few seconds, while the bamboo frame of our shanty squeaked fearfully, and an awful wail went up from the panicstricken inhabitants of the hamlet. Abruptly the vibration ceased as quickly as it had arisen, and we were able to stand up and move out into the open air, where we found the natives flat on their faces and heartily praying. It required a deal of persuasion on the part of the Raden to induce them to arise from their recumbent positions, and re-enter their domiciles, which had received little or no injury, on account of their peculiar bamboo construction.

The next morning the Raden received notice that a landslide had taken place in a ravine about a mile distant, and after breakfast we visited the locality and found that about an acre of woodland had slipped from a hillside into a valley, making one of the most complete examples of havoc that I ever witnessed, and furnishing an undeniable reason for the fearful crash and corresponding tremor which had been felt on the preceding night.

After such a terrible shaking up we were very anxious to hear from our scouts on the trail of the rhinoceros, and our anxiety was relieved about noon by the tidings that she and the calf were completely surrounded, and a party were at work arranging a driveway, along which they would be forced, so as to give a fair shot at the mother and insure the consequent capture of the youngster.

The driveway was in the form of an enormous Y, with the men stationed at short intervals along the outer edge and across the upper portion, Ferrari and myself were placed about midway of each jaw, so as to get a shot at the mother, while the frightened calf would be driven forward until it reached the junction of the paths where it would inadvertently thrust its head through a noose, which had been stretched across the pathway, and on rushing a few steps further, it would be entangled in a second one. To both of the nooses had been tied small, short bits of logs, which would serve as drags, for the purpose of wearing out the captive. The path in which the nooses were arranged was very narrow, and the sides were composed of a dense wall of heavily leaved palm branches in order to prevent any attempt at a bolt before becoming entangled in the second noose.

The Raden picked out the positions which Ferrari and myself were to occupy and then hurried off to give the signal to the drivers. In a very short time a most terrific din was raised, and the panicstricken animals rushed past Ferrari, who was so fortunate as to drop the mother in her tracks. The calf rushed headlong into the first noose and in a few seconds was entangled in the other one and trotted off, dragging the pieces of wood after him. The Raden then selected about a dozen of the drivers to follow the little one and keep it moving, so as to gradually tire it out, which he informed us would take some three or four days, as he did not wish to wear it out suddenly for fear of injuring it permanently. I noticed that every man he picked out carried a gun, while a large majority of those who had helped to make the surround were unarmed. On asking for the reason of the selection, I was informed that only the most skillful and trustworthy were allowed to carry arms, which fully accounted for the preference.

After receiving special orders from the Raden to keep the youngster in constant motion without pressing him too hard, the hunters started on his trail, which was easily followed, on account of the traces left by the bits of wood. The Raden, Ferrari and myself then returned to our hastily erected domicile, spent the night, and the next morning Ferrari started for Buitenzorg, as he could not afford to be absent any longer from his hotel, thus leaving the Raden and myself to look after the capture of the calf. We bundled up what traps we thought necessary for our journey and started to follow the pursuers of the baby. It did not take much time to overtake them, as their progress was somewhat slow. Their mode of procedure was to keep within a short distance of the tags and whenever the fugitive showed any disposition to stop and rest, a tug at the little logs would quickly cause a forward movement. As the ropes were some thirty or forty feet in length, there was not much risk from a charge, and if a vicious one was made, every one acted so as to divert the attention of the animal from his tantalizer. The Raden and myself were much amused and interested at the various ways by which the vicious lunges of the irritated animal were avoided by his skillful pursuers, and he was kept on the move from the earliest dawn until darkness set in. The hunters' food was passed to them while they were moving, and it was the special task of two men to keep the entire party supplied with fresh cocoanut milk, while one would be serving out draughts to the thirsty party, the other would be seeking a grove of the trees, from which he would gather the nuts and hurry back with a bag of them, so that there was no suffering from thirst. For a thoroughly cooling and refreshing drink, I have never tasted anything to compare with it. At dark the huntsmen would cease persecuting their quarry and form an impromptu camp immediately around the logs, while the Raden and myself were sheltered under a hastily constructed shed of palm branches.

The pursuit continued in this manner until late in the afternoon of the third day, when the Raden thought the hour had arrived for the complete checking and consequent capture of the nearly worn out calf. By his orders two of the hunters seized the logs and suddenly wound the ropes around two convenient trees, which entirely checked the forward movement of the little one, which lay down, seeming completely exhausted. Two hunters then advanced with a couple of nooses fastened to bamboo poles, for the purpose of entangling his legs and weaving a complete network around him. They not acting precisely as the Raden thought proper, he hastily stepped between them and their quarry, when to the consternation of the entire party, he received a backward charge, which tossed him among the branches of a leaning palm, where he hung senseless, while the calf prepared to follow up his advantage by another attack. I shouted "Badil! Badil!" "*Shoot! Shoot!*" when he received a volley which dropped him in his tracks, and every one rushed toward the unconscious Raden, who was quickly and gently lowered from his dangling situation and softly laid on a makeshift bed of palm leaves. In a few minutes he showed signs of returning consciousness, and soon was able to sit up and show that he did not suffer from broken limbs. A comfortable litter was manufactured, in which he was placed, and we started on our sorrowful tramp to Sagranten, which we reached in four days, with the Raden much improved, but still unable to walk without assistance.

For several days I was busy superintending the making of temporary cages for the transportation of the living zoölogical specimens secured during my trip. As all of them had to be carried on men's shoulders, their construction required a deal of thought and trouble, and I found that bamboo served as their main component. The Raden kindly drew a rough map of the best route to Buitenzorg, and I bade farewell to him while he was seated on his piazza at a table, busily engaged in playing solitaire.

FRANK J. THOMPSON.

The Fascinating Kissimmee.

From the Florida Times-Union Citizen, describing a trip in midwinter of 1901-2.

THERE is an old Oriental saying, "See Damascus and die." That city was considered so beautiful that it was taken for granted that it was no use living with the expectation of seeing anything to compare with it this side of paradise, and though we do not recommend the latter part of the saying to our readers so far as Florida is concerned, yet we can safely assert that no one can be said to have seen the beauties of the State unless they have made a trip down the Kissimmee River. Without being grand, there is a quiet beauty about it which clings to the memory—it is the beauty of repose, and from the time the steamer starts from the dock at Kissimmee till she reaches her destination at Bassinger or Fort Myers, one never wants to take his eyes from the every varying picture constantly opening up before him.

For the purpose of writing this notice we accepted the invitation to make the voyage in the fine steamer Bassinger, belonging to the Gilbert Bros.

On leaving Kissimmee, the first thirteen miles are over the waters of Lake Tohopekaliga, a Seminole name signifying the "sleeping tiger," probably so named from its shape. Several oak and palm-covered islands, one of which is called Paradise, deep bays and long sandy beaches, diversify the scenery till we reach the commencement of the great drainage system inaugurated by Mr. Hamilton Disston, at Southport; hence a canal 100 feet wide and four miles in length was cut, and in addition to forming a means of navigation to the coast at Punta Rassa, on the Gulf of Mexico, was the means of reclaiming a large extent of splendid land from the original swamp which existed there, and which is now partly under cultivation as a truck farm, the crops on which were looking particularly rich, and there are possibilities of many more on both banks of the canal. About half way down we saw a flock of about 1,000 sheep and lambs, all in good condition, and we learned that the increase is nearly 100 per cent., owing to the number of twin lambs. One of the chief causes of anxiety for their safety is due to eagles while the lambs are small. Cattle, too, are to be seen feeding in and near the marshes on either side. Near the lower end of the canal the land gradually slopes down till it forms the marshes which almost entirely encircle Lake Cypress, a sheet of water about five miles long by about one and a half miles in width. Another canal of three miles in length from this brings us into Hatchneha. We pass several projecting oak-covered beaches, with deep bays between, and then crossing a long arm, the lake narrows between fairly high pine woods and oak hammocks, and forms the real commencement of the Kissimmee River at Shell Hammock, a tract of high land covered with giant spreading oaks overhanging the river, here about forty yards wide, and extending down the river for more than a mile, to Gardner, another landing place on the river. At Shell Hammock a hotel has lately been opened for the benefit of tourists and sportsmen, as the river is famous for its fishing, and quail, ducks and snipe are plentiful in the season, and there is an occasional chance shot to be had at deer or turkey. Both these places are exceedingly picturesque, great moss-festooned oaks overhanging the deep running river, and palm trees and palmettos lend a tropical appearance. As the distance from Kissimmee is only twenty-five miles by water, it has become a very favorite picnic ground for the people

of the town, who often take advantage of moonlight nights to make a delightful day's outing.

It is also the landing place for a large cattle district, and the quantity of grain landed shows that a considerable number of people must be engaged in the stock industry. A few more miles brings us into Lake Kissimmee, a body of water some twenty miles long, with several deep bays, which may give it an extreme breadth of ten miles. We are now fairly in the cattle country, and large herds may be seen on all the shores, and the steamers stop at various points to land corn for the horses and supplies for the riders; we pass Bramah Island, about 1,200 acres in extent, and at Turkey Hammock the lake once more contracts, and again we get into the river, which now continues for over one hundred miles, till it empties itself into the great Lake Okeechobee. The first place of importance we stop at is Rattlesnake Hammock, fourteen miles from the lake; the residence of Mr. W. E. Godwin and family. A large clump of bananas well advanced in fruit, with their great shining leaves, almost surround the house, and show that, though it is now the end of January, the winter in this section is of the mildest description; ripe tomatoes and an ornamental garden of shrubs and flowers, such as the royal poinciana, hibiscus and other tender plants, all out in bloom, bear out this fact, and are an object lesson by showing the value of the climate prevailing here. A flock of sheep were feeding near the river, and our attention was attracted to a herd of well graded cattle, as well as some well-bred pigs. As we leave Mr. Godwin places in our hands a specimen of a Florida life preserver in the shape of a sweet potato, as perfectly and evenly formed as a large muskmelon, and weighing nine pounds. So perfect is its shape that we have placed it on exhibition as a pattern to our farmers.

From here we wriggle and twist through a tortuous river, compared to which the letter S is a straight line, but our captain knows the river and his boat, and negotiates the banks in good style, though occasionally an exceedingly acute angle—it cannot be called a bend—compels us to stop and back up—and then we arrive at Orange Hammock, long famous as the finest grove on the river, and for the quality of its fruit. Many of the trees are over twenty years old, and though at the time of our visit the greater number of the oranges, over 3,000 boxes, had been shipped, still there were enough left to show the excellent quality and productiveness of the trees. The grapefruit trees were particularly well loaded, and a curious feature of the grove is the number of trees budded on the same stock with orange, grapefruit and tangerines. Some sixty hives of bees are kept here, and we learn that last year over one ton of honey was shipped from this grove, clearly indicating another great industry in the near future.

Leaving Orange Hammock, some miles of more crooked river brings us to Fort Kissimmee, so named during the Seminole war, when, in March, 1852, the fort was erected and occupied by the United States troops. Now, the Indian war whoop is heard no more along the river banks, and the place is peacefully occupied by one of the valley cattle kings and pioneers, Joe Gay. Again we are on our way, ever getting further south, twisting and turning about in the crooked stream, which shows clearly through the wondrous aquatic growth of bonnets, with their great leaves shimmering in the sunshine on the surface of the water, while their long stems rise from their roots away down in nine or ten feet of water. Long fringes of water willow line the banks for miles, where these are partly submerged. Bull-tongue, water-lettuce, Indian arrow, saw and cane grass fill up the spaces unoccupied by the bonnets, but all adding a bright greenness most refreshing to the eye. Where the high land strikes the river great live oaks, moss festooned, hang over the water, and large clumps of giant palm trees add a pleasing change to the apparently never ending marsh of aquatic plants, through which the river wends its way, but everywhere there are cattle. You see them away back on the prairie as far as the eye can reach, in the hammocks, and here and there we see them feeding in the marshes, with the water nearly up to their backs. They have grown accustomed to the steamers, and barely lift their heads as we steam close past them. Now and again we make out a bunch of razorbacked hogs, but as a rule most of the settlers are now keeping improved breeds, and the long-snouted, slab-sided rooter will soon pass away. As we came sharply round some of the bends, we disturb an alligator basking in the sun on the banks, but they quickly splash heavily into the deep water below.

The bird life is wonderful; it is now midwinter, and large flocks of big gray duck, pintail and teal, fly wildly away on our approach. A purple gallinule, or the beautiful crested wood duck, occasionally give us a glimpse of their brilliant plumage, and the ubiquitous coot just flaps out of our way or dives under a branch leaf, to reappear when we have passed. Numbers of those birds so faithfully and well depicted by Japanese artists, the great heron, are to be seen perched on low bushes, or standing in the marsh with outstretched neck ready to strike frog or fish. We disturb them, and with legs stretched out and neck tucked in, they wing their heavy flight lazily away; long curved bill, brown limpkins, eye us curiously, and either fly or run a few feet off and go on with their feeding on snails or small crustaceans. Mexican buzzards, eagles and hawks soar over our heads, while blackbirds and ricebirds are everywhere. Great flights of white curlew wing their phalanx-formed way to and from their feeding grounds in the early mornings and evenings, and during the day whiten the willows with their numbers, but we miss the plume birds and the pink ibis, which were once so numerous on this river; alas, they have all gone—killed out to gratify a feminine fashion of adornment.

More bends and twists bring us to where the river from Lake Istokpoga joins the Kissimmee River, and here we make a trade with a party of hunters for coon and otter hides brought down from the lake, and again we wriggle along, ever getting further south, past Miccos Bluff, and then reach Laniers. At this place high oak land comes steeply down to the river for a long distance, and a great deal of this has been cleared up and set with groves, which will soon be planted out into one continuous grove of over a mile in length; some of the trees are now ten years old, and are in splendid condition, and when the different groves are all connected and set out with about 2,000 trees, it will certainly be the show place of the river. We must not omit to mention that it includes the famous old Pierce grapefruit grove, containing about eighty trees, many of them over thirty years old. They are immense in size, and their bearing qualities are in proportion to their size.

A little further on we reach Fort Bassinger, also an old military camp during the Seminole war, situated on the proper right bank of the river, now an orange grove on high commanding land, which rises steep from the river; on the other side of the river, about two miles back, is the settlement of Bassinger, with the thriving village of the same name, containing several good stores, church and schoolhouse. The settlement has a population of about two hundred, and the principal occupation is connected with the cattle industry, of which this place is the great center. The range in this section seems admirably suited to stock raising, and it has long been the home of one of Florida's chief cattle kings, Mr. Morgan, who has been credited with about 30,000 head; but there are many more in the district with their thousands. These people are now making themselves comfortable homes, and with the establishment of regular steam communication will be able to provide themselves with many more of the luxuries of life than they have hitherto been able to obtain.

Bassinger, which is about 150 miles from Kissimmee, is half way to Fort Myers; after leaving Fort Bassinger, the river finds its way through a great sawgrass-covered marsh, forming the commencement of the great Everglades, in which Ponce de Leon expected to find the fountain of eternal youth, some forty miles brings the traveler into the great Lake Okeechobee, in the middle of which you get out of sight of land, and which from its shallowness can be very rough. Thirty miles from the entrance of the Kissimmee River a canal leads into a small lake, Hickpochee, and from that the Caloosahatchee flows. The river then runs by Fort Thompson, Fort Denand, and other places of interest connected with the Seminole war, and then you feel a saltiness in the air, and smell the ozone of the sea, and you find the steamer heading down the Caloosahatchee Harbor, and the voyage is ended at Fort Myers. There are three lines of steamers engaged on the river work, making each a weekly trip to Bassinger, viz., the Lillit, Capt. Johnson, new steamer; the Bassinger, owned and sailed by the Gilbert brothers, and Capt. Hall's Naoma. These boats are all skillfully handled, and it speaks volumes for the enterprise of their owners that, in spite of low water and small freights for many years, they have stuck to it in full confidence of the future of the Kissimmee Valley, and now, with increasing settlements and general prosperity of the residents, they are beginning to reap the reward of their patience and perseverance.

The most important factor in the prosperity of Osceola county is stock raising. From very early days in the history of Florida, the Kissimmee Valley and adjoining ranges have been regarded as about the finest in the State, and probably in the whole of the United States. Many things conduce to make them so, good pasture, shelter, abundance of water and mild winters, making it an ideal country for all kinds of stock, as they can be left throughout the year in undisturbed possession of their pasturage, and change it according to the season, moving from the high prairies when the grass there becomes used up to the low, marshy grounds which follow the course of the Kissimmee River for so many miles, affording an abundance of the richest food at all times when the water is not too high. An idea of the importance of this section can be formed from the fact that about 100,000 head of cattle are annually grazed upon it, their total subsistence being obtained from the natural native growth, which reduces the cost of raising to a minimum.

Natural History.

The Drumming of the Grouse.

A GREAT portion of our information and general knowledge must come through the investigation and observation of others; therefore it is interesting and instructive to read or hear the opinions of others, and much more, the result of their investigations. That which affords such a wide field for discussion, and brings out such heated arguments regarding wild animal life and natural history, is the fact that it is the animate object that is being dealt with, and even much experience will not make us gracious enough to allow the animal or bird of our opponent in discussion to act differently from that which may have come within our own experience. The chemist believes that he knows the result that would be obtained by combining two or more liquids, after reading the experience of some one who has tried the experiment and given the result; but if some one were to claim to him that such results were not to be obtained, he would easily be made skeptical, because he did not "know" that such was the case only from reading it; but allow him to make the same experiment himself, and obtain the same result, and all creation could not change his belief, because he "knows what he is talking about." That is all right, and admits of little chance for argument, because it is dealing with inanimate objects, which are generally the same under like conditions. As I said, much of our general knowledge must come through what we hear and read, as a result of the observations of others, and this, when dealing with inanimate objects, is more or less reliable; but in natural history nothing is so satisfying as personal contact with the subject studied. If a friend told us of an experience with beast or bird, and its attendant result, and we were to have an experience of like character with the same species, with an entirely different result, we would always expect a like result as our experience had brought, under the same conditions, no matter what confidence we may have in the truthfulness of that friend. We frequently hear that certain actions will result in certain conditions, and it is my delight to investigate such reports, and had circumstances permitted, it would have been the joy of my life to have devoted all my time to the study of wild creatures, for surely no study could be more fascinating.

When a child, I was told by my wicked elders that if I would put salt on a bird's tail I could catch it; and many vain efforts did I make to land the salt where it would work the charm.

It has been asserted, and to some extent believed, that while a partridge is drumming, it is deaf and blind to all its surroundings, so that if one were near enough when it begins drumming he might go right up to it without its stopping. I could not rest until I tested it, although not believing it. One day, being in the woods and hearing one drumming, I crawled up behind a log until I was within twenty-five yards of it, then lay quietly until it began drumming, when I jumped over the log I was behind, thinking to make a dash toward it, and drop down just before it would stop, and thus work my way up to it. The instant I landed over the log, although it was right in the midst of its drumming operations, it stopped, jumped off the log and ran off through the woods. Then I "knew" they had the full use of all their acute senses while in the act of drumming. It is considered quite difficult to approach near this wary bird while they are perched on their favorite log, sending forth their autumnal thunderings, but I have never found any difficulty in getting where I could watch their performance, and when a boy that was my favorite method of hunting them, having shot them when in the midst of their drumming process. Many people believe they produce the sound of their drumming by striking their wings on the log, while others claim the sound comes from the tips of their wings striking together, but it is simply, as most people know, their wings striking their body, and is the same as the noise produced by flying.

When they drum they rear back until their head is perpendicular with their feet, which gives their wings a horizontal movement, instead of up and down, as would naturally be supposed. During the month of October of this year I was visiting the old home in Pennsylvania, and while out rambling through the old familiar woods where I hunted in boyhood, I heard a partridge drumming about 100 yards away. I began my old-time cautious approach, and finally got the range, which seemed to locate it near an old dead chestnut tree. Beyond this tree about 50 feet, was a large log lying off the ground, which hid from view everything beyond it; about 20 feet beyond the tree was a shorter log, which was also rather high; between these was a little short log lying flat on the ground, entirely out of my sight when down on my hands and knees, and about 30 feet from the tree, and on this little log the old cock was standing. I concluded he must be beyond the furthest log, but waited for his next report; presently it came, and as it sounded on ahead I went on noiselessly as before, and just as my head came around the end of the first log which brought me in view of the little log, I heard the familiar k-r k-r k-r, and looked around just in time to see him not over 10 feet from me, which was the closest ever I got to one while at its drumming.

EMERSON CARNEY.

MORGANTOWN, W. Va,

Wild Pigeon Flights.

AUDUBON has left a description of a myriad migration of wild pigeons he witnessed in Kentucky. Evidently he did not witness the most interesting feature connected with the congregation of wild pigeons, or he certainly would have included it in his account. I refer to the collection of the birds at night—a pigeon roost. I had the pleasure of witnessing such a scene as the naturalist describes in northern Louisiana in 1873; and I can testify that Audubon does not in any way exaggerate as to the number of the pigeons seen.

About ten o'clock in the morning a cry was raised by some boys in the streets of the small town in which I resided, "Look at the pigeons! The pigeons! The pigeons!" The cry becoming general, everybody, old and young, men and boys, women and girls, ran into the streets to look at the immense numbers of the passing birds. Many seized their guns and ran to a waste field on the west side of the town, and there banged away at the feathered passengers, killing some, but not disturbing the birds any more than to fluster those overhead a little, just as a stick or stone flung into flowing water will create a momentary divergence among some of the particles, but the gap is speedily filled up and smoothed over by the ever rushing stream.

The birds were fairly above the tops of the tallest timber, about one hundred and fifty feet high; and were flying in a southern direction. It is impossible to make any estimate of the vast numbers that passed, but from 10 o'clock in the morning till nearly 2 o'clock in the afternoon, the air was literally filled with them. They flew in regiments, in corps, and in divisions; some of the later stretching for miles in length, numerous tiers in depth, and exhibiting so close and compact a body that the wings seemed almost to touch, and coming between the observer and the sun, shut out the light so completely as to have it appear that the twilight had come on.

The field afforded an unobstructed view, both north and south, for a considerable distance, and one could see flocks of birds in the air for more than a mile, appearing at first like thin blue clouds, but becoming more and more dense as they continued to approach, until sufficiently near the observer for him to descry, first, innumerable dots as composing the nebulæ, and then in a few seconds more behold those dots transformed into flying birds.

Looking upward and northward, one could trace the dark blue column until the limit of vision was reached, and when at last the termination of a great flock was perceived, a mass, dense and dark, composed of hundreds of tiers of birds, extending downward toward the earth, and stretching out for a considerable distance on each side, the line of flight appeared like a great cross-bar, which the long column was dragging, and forming a fitting period to the aerial march of millions.

The zone, or path of passage—hardly a half mile wide—was quite closely adhered to; indeed, the greater number of the flocks, of which there were several hundred, perhaps a thousand or more during the day—passed through a space of considerably less width.

The migration was doubtless due to the breaking up of a roost some distance to the northward, incident to the food supply of that region becoming exhausted, and the immense numbers were now moving over a territory, where the oak timber, probably having suffered from late frosts and ravages of insects, offered little or no inducements for a halt, to a district further south, where the season had been more propitious and the acorn food was to be found in abundance.

Wild pigeons seem to prefer to fly in single tiers, at

least nearly all small flocks exhibit this formation; but, unlike wild geese or ducks, they do not follow a leader, and form no arrow-like bodies in the air, but advance in a line like soldiers, one as far forward as another. Flocks of small size can at times be seen flying through the timber and generally a few feet below the tops of the trees, just where the limbs appear thickest and present the most impediments to fast flight. A mount of only a yard or two would put them above all obstructions; yet they continue their flight upon the lower plane, and apparently with as much speed as if in the open. They dash and wheel, this way and that, now under, now over obstructions, and now seemingly hang momentarily in the air, before entanglements of limbs that present an almost impervious front, but the next second they have passed on; how, one cannot exactly tell, breaking their line of formation, however, but reforming it in the next open space beyond, and all this breakneck racing continued for miles without ever touching a limb with a feather.

In large flocks numerous tiers are observable, but while the line formed by the advance birds is quite clearly defined and maintained, there are no lines resembling ranks perceivable among those that fly after upon the same plane.

There is a curious bit of evolution connected with the flights of these birds; and, although the same conduct may be observed among blackbirds, yet it is never upon such scale as in the case with the long columns of the swift flying pigeons. A great flock, perhaps a half mile in length, would be flying along in column like shape, when, suddenly the leaders would dart down almost to the ground and then back again toward the plane upon which they had been flying, with such speed that the eye could scarcely follow them; and this action would be followed by every bird throughout the entire flock, and with such accuracy that the column would appear like a long waving scarf, gliding through the air with remarkable rapidity. The bird does not pitch directly forward and downward, but seems to partly close the wings, one, a little more than another, perhaps, and makes the descent in a sidelong manner; but the dash upward, if not upon a straight line, lacks but little of it. The curious part is, how one bird finds out what his neighbor is going to do, so that he may execute the maneuver to the line, and as quickly. Yet the telegraphy must be perfect, for every bird darts and dashes exactly as and when all the rest do, and the flock resumes its usual flight, as if it was more a solid body than consisting of an immense multitude of individuals. Whether the action is caused by their meeting with a stratum of air different from and less pleasing than that through which they had been flying; or, is a kind of bird evolution executed out of pure joyousness; or, a parade of bird telegraphy and drill for the benefit of the two-legged creatures called men down on the earth observing, will have to be left entirely to conjecture.

For sometime before the establishment of a roost, flocks of all sizes will be seen flying about in every direction, evidently inspecting the quality and quantity of the acorn crop. Large areas, doubtless, are looked over and reported upon, and at last a convenient and central spot is chosen as the place for the roost. Here at nightfall all the birds for a considerable distance, and considering the pigeons' power of flight, this must mean a territory with a radius of forty or fifty miles—assemble, to digest the acorns and pass the night.

At sunrise not a bird is to be seen, all having dispersed at daylight in search of food. They feed on the ground in flocks ranging from hundreds to thousands. It is a curious sight to see them in the woods after the acorns.

A flock will alight on the ground and every individual goes forthwith industriously to work, scratching away the leaves that cover the food; and if the flock be large, the leaves are fairly made to boil up, as if a tiny whirlwind had got underneath them and produced the commotion.

A feeding line is established, and when the birds in the rear can find no food, they fly over the rest of the flock, and alighting a few yards in advance, begin again their work with the leaves. Those now left behind repeat this maneuver whenever the find fails, so that there is almost always a flock of birds in the air. It is astonishing how great a distance they will travel in this way in a short time. A hunter must get well in front if he desires a shot, and allow them to feed toward him; when a shout sends them into the air, and he fires on the wing, for though there may be thousands of the birds, and quite near, they cannot be seen on the ground for the flying leaves.

Late one afternoon the intelligence spread that the wild pigeons had found a roost on the west side of a small prairie about seven miles away. We hastily formed a party of some six or seven, horses were saddled, blankets rolled up and tied behind, and food being hurriedly secured for man and horse, we seized guns, mounted and struck gallop for the place. It was quite dark when we reached the edge of the prairie, but as soon as we were fairly out in it, we could see quite distinctly, and were able even to make out the lines of timber bounding on all sides. It was a beautiful night, and although there was no moon, the stars shone overhead, and some fleecy clouds appeared above the horizon.

A halt was called to breathe our horses. We dismounted, and with bridles in hand, stood to listen to the pigeons that about one and a half miles across the prairie were gathered in the timber to the west. It is impossible to describe the noise made by a vast number of pigeons forming a roost. It resembles somewhat a great roaring wind; but still, the ear can detect therein a multitude of minor noises, which, although collectively constituting the great roar, are not so thoroughly attuned as not to be noticeable. The noise is in some way connected with the process of digestion. The crop is filled with acorns at night, but in the morning it is empty. Some imagine that the bird opens its mouth to produce a stir or grind among the acorns in its craw, thus causing a slight noise to be made with the vocal organs; and this performed by millions, produces the roar.

The roaring is only heard when the birds are at rest, perched upon the limbs of trees. On a still night it can be heard for a distance of three miles.

Remounting, we rode across the prairie and entered the timber on the west side, the roaring growing louder and louder, as we advanced. We encountered considerable undergrowth for several hundred yards that compelled us to ride in single file, and rendered our progress necessarily slow. Reaching a small brook where the undergrowth seemed to terminate, we dismounted and tethered our horses to trees, unsaddling and feeding them as well, for we meant to follow the pigeons afoot and probably until daylight. Then we followed our captain in single file.

If the roaring would have been considered loud at a distance, now that we were directly underneath a part of the roost, the noise made was fairly deafening.

The birds were roosting in tall pine timber, most of the trees being over seventy feet high. It was quite dark, and though the noise proclaimed tens of thousands above us, we could not see a single bird.

Selecting a tree that appeared a little lower and more umbrageous than the rest—for the form of such trees as stood something apart from others could be dimly discerned as outlined against the sky—our captain shouted his commands for us to point our guns toward the branches of the one tree, and counting one, two, three, as a signal, all fired. The report of twelve or fourteen heavy charges from shotgun barrels, and proceeding from a single spot, silenced all other noises and sent the myriads of birds into the air. We heard numbers of limbs crack, break and fall, as the pigeons betook themselves to flight; for, indeed, limbs can be found of surprising size broken and lying on the ground on mornings after the trees have been occupied as a roosting place.

Through the open spaces above we could dimly discern vast numbers of the birds in the air; the swish of their wings being particularly audible. For a time it seemed as if they were undetermined as to which way to go, sailing around on slow wing just above the timber, but finally they moved off in a southeast direction, and in a few minutes more we heard the roaring begin, betokening the fact that they were again settling in the trees.

We now set to work to recover the birds that had fallen at our discharge, and while we were lucky enough to find some pieces of pine for torches, the light was so imperfect that it was only possible to find the major number of those that had been struck dead, all with broken wings—of which there must have been a number—fluttering a short distance away in the darkness, being abandoned. As it was we filled a three bushel sack with those obtained.

We soon found that there were several parties in the woods, and not being able to come up with them so as to form one party and thereby exhibit concerted action in the hunt, and seeing that desultory firing would force the birds to remain on the wing, or, else, move off too far to be followed, we returned to our horses about midnight, and after building a rousing fire, slept until daylight.

I visited another roost two or three years later about fifteen or sixteen miles to the south of the one described. The same cause, however, operated against our obtaining many birds. Men and boys had come to the roost from different directions and kept up a continual firing, until finally all were driven beyond hearing. The previous night, however, which was the first the birds had roosted in this location, had been passed by them without being disturbed. In looking about the next morning after I was there, I could not help remarking the effect the weight of the birds had upon the timber. The woods were principally composed of yellow pine, large trees, with tall, slim saplings of the same species for an undergrowth. A number of birds alighting in the small branches of these pliant saplings caused them to bend considerably at the top, and fresh numbers continuing to arrive and always, of course, perching upon the upper or bow side, weighed down the young tree more and more, until the upper portion of the trunk appeared almost horizontal. This weight remaining steadily upon them all night, well nigh took all the spring out of the timber, and the trees, when the birds had flown and the weight was removed—unable to assume an upright position—still exhibited a bent attitude.

It was a queer sight. The saplings looked as if their tops might have been filled with loads of ice and snow for some time, or that the trees had been on a lark, and as yet had not sufficiently recovered to perform their ablutions.

Some long-winded yarns are spun on the subject of wild pigeons in the Southern States, where they were plentiful during the seventies. Many birds no doubt have been killed with sticks, and sack loads of them brought home as trophies of a visit to the pigeon roost, for I have heard such tales related by persons whose veracity could not be doubted. Still, we have representations of the size of fish, the length of snakes, the weight of deer caught and slain, to continually deal with, and as the general sportsman demands that the microscope be passed over these before entries thereof are made in the record, it is evidently but just to employ the glass upon many of the wild pigeon stories, true, perhaps, but not in a digestible condition.

The wild bird has about the same stretch of wings as his domesticated brother, but is not so heavy, being of a neater, trimmer build. The sexes bear no obvious marks by which they can be distinguished, both being of a pale blue color, with feet so clean and red, that it would seem that nature's washerwoman had scrubbed them in ice water so long that they appear well nigh frozen. The meat of the bird is dark, like that of the genuine fowl, but not so sweet and tender; yet, after thorough cooking, it becomes fair eating.

For speed among the long distance fliers, the pigeon probably ranks first, it being supposed that it will cover sixty miles an hour, and the hunter is aware of the distance birds shot flying will be carried by the momentum before falling.

The sagacity of the engineer birds, as shown in the location of the two roosts mentioned, was very apparent, they being pitched near each other in the first considerable body of pine timber—a species the pigeon seems to prefer—upon the bluff, marking the western edge of the Mississippi Valley. The valley, fifty miles broad, contained multitudes of mast-bearing trees; while the uplands, for an equal distance to the west, watered by several considerable streams, grew immense numbers of water oaks, of the acorns of which the bird is particularly fond. During both these years the mast was exceptionally good.

Though multitudes were to be found in this region during the time to which the description refers, the wild pigeon has now entirely disappeared; from what causes cannot now be ascertained; but certainly not from lack of food, for though many of the acorn-bearing trees have been destroyed by the timberman of late years—still those were of selected growth—the bulk of the timber still remains.

As those that once were, however, hatched and grew up unnoticed until their numbers were legion, it might be that they again may increase to myriads, and, if so, those who will then behold them will agree with those who have beheld their numbers in the past, that it is one of the sights of a lifetime; doubtless the greatest concourses of birds on the continent; perhaps the greatest that have taken place in the world.

American Ornithologists' Union.

THE twentieth congress of the American Ornithologists' Union convened in Washington, D. C., Nov. 17, and continued until the 20th.

Monday was devoted to a meeting of the Council, and to the evening or business meeting of the Fellows, both being held at Dr. Merriam's residence. The public meetings, commencing Tuesday, Nov. 18, were held in the large lecture hall of the U. S. National Museum.

The Fellows present were: Drs. C. Hart Merriam, A. K. Fisher, T. S. Palmer, C. W. Richmond, Theo. Gill and L. Stejneger, Profs. F. E. L. Beal and W. W. Cooke, Messrs. R. Ridgway, F. A. Lucas, E. W. Nelson, H. C. Oberholser, and Wm. Palmer, of Washington; Drs. J. A. Allen and Jonathan Dwight, Jr., Messrs. Frank M. Chapman and Wm. Dutcher, of New York city; Wm. Brewster, of Cambridge; Chas. B. Cory, of Boston; Ruthven Deane, of Chicago; Prof. Walter B. Barrows, of Lansing, Mich.; Dr. Thos. S. Roberts, of Minneapolis; Dr. Louis B. Bishop, of New Haven; Witmer Stone, of Philadelphia, and John H. Sage, of Portland, Conn.

The members and associates present during the sessions were: Dr. F. H. Knowlton, Vernon Bailey, Nelson R. Wood, Dr. Wm. C. Rives, Mrs. Florence Merriam Bailey, Mrs. Jeanie M. Patten, G. S. Miller, Jr., Dr. Wm. L. Ralph, John W. Daniels, Jr., H. W. Olds, Edward A. Preble, Barton W. Evermann, H. W. Maynard, Dr. Hugh M. Smith, Frank Bond, Frank H. Hitchcock, A. H. Howell, Paul Bartsch, A. M. Reed, and E. A. Goldman, of Washington; Louis Agassiz Fuertes, Mrs. Olive Thorne Miller, Miss Eliza S. Blunt, Miss Isabella L. Sand and Miss E. Putnam Moore, of New York; Geo. Spencer Morris, C. J. Pennock, Dr. R. M. Strong, Wm. L. Bailey, Sam Wright, W. E. Clyde Todd and Jas. A. G. Rehn, of Pennsylvania; R. W. Williams, Jr., of Florida; Walter Deane, Mrs. Anna B. Phelps, Geo. C. Deane, Rev. Wm. R. Lord, and Miss Harriet E. Richards, of Massachusetts; Hubert Lyman Clark, of Michigan; Mrs. Elizabeth B. Davenport, of Vermont; Prof. T. Gilbert Pearson, of North Carolina; Dr. W. F. Hutchinson, of Virginia, and Wm. B. Evans, of New Jersey.

Dr. C. Hart Merriam was re-elected President; C. B. Cory and C. F. Batchelder, Vice-Presidents; John H. Sage, Secretary; William Dutcher, Treasurer; Frank M. Chapman, Ruthven Deane, Jonathan Dwight, Jr., A. K. Fisher, E. W. Nelson, Thos. S. Roberts and Witmer Stone, Members of the Council.

Henry C. Oberholser, of the Department of Agriculture, Washington, D. C., was elected a Fellow; Ernst Hartert, of Tring, England, and John A. Harvie-Brown, of Stirlingshire, Scotland, Honorary Fellows; Archibald J. Campbell, of Melbourne, Australia; W. P. Pycraft, of the British Museum, London; Dr. H. von Ihring, of Brazil, and Alfred J. North, of Sydney, N. S. W., Corresponding Fellows. Thirteen associates were elected to the class known as Members, and eighty-four new associates were elected.

Mr. Geo. Spencer Morris read extracts from the unpublished journals of Edward Harris—the friend of Audubon—and gave many facts relating to his life. It was an important contribution to the historical side of ornithology, and will undoubtedly be published.

A paper by Prof. T. Gilbert Pearson on the summer bird life of Eastern North Carolina provoked much discussion, and many inquiries were made for further information about the birds of that State. Dr. Bishop spoke of the species found along the coast, especially as regards their destruction by marketmen and milliners' agents. Mr. Dutcher remarked on the proposed legislative bills looking to the protection of birds on the North Carolina coast. Dr. Palmer thought the upland, as well as the shore birds, needed protection. He told of the immense number of ducks annually taken to the northern markets. Prof. Pearson referred to the destruction of bob white in his State, and of the illegal methods used in their transportation north.

Mr. Chapman compared the bird life of Gardiner's Island, N. Y., and Cobb's Island, Va., and showed conclusively the great benefit of protection. Gardiner's Island has been owned for several generations by the Gardiner family, and birds, having always been protected there, are increasing, while at Cobb's Island, for want of suitable protection, the birds, once so common, are now nearly exterminated.

The report of the Committee on Protection of North American Birds, read by its chairman, Mr. William Dutcher, showed that satisfactory results had been obtained during the past year, and that interest in the preservation of wild bird life was not lacking at the present time.

Dr. T. S. Palmer spoke of Federal Game Protection in 1902, and was followed by Mr. Sheibley, of the U. S. Department of Justice, who commented on prosecutions under the Lacey act.

In his "Glance at the Historical Side of the Check-List of North American Birds," Mr. Witmer Stone referred to the help accorded by the earlier ornithologists in making a check-list possible, and gave in detail the number of species described by each. Dr. Allen traced the history of the present A. O. U. Check-List from its inception, and spoke of its future.

The Union sustained a severe loss in the death of Major Jas C. Merrill, U. S. A., a prominent Fellow of the Union, and of Chester Barlow, a Member, who was also the leading spirit in the Cooper Ornithological Club, of California.

By invitation of the secretary of the Smithsonian Institution the members of the Union visited the National Zoological Park on Friday, Nov. 21, and many availed themselves of the privilege. Secretary Langley received the

visitors, who were subsequently taken through the Park by Dr. Frank Baker, the Superintendent.

The question of holding a special meeting of the Union in California the coming year—possibly in May or June—was referred to a committee, with power.

The next annual meeting will be in Philadelphia, commencing Nov. 16, 1903.

Following is a list of the papers read at the sessions:

1. "Notes on the Life of Edward Harris, with Extracts from his Journals"—Geo. Spencer Morris.
2. "The Development of the *Pterylosis*"—Hubert Lyman Clark.
3. "The Domestic Affairs of Bob White"—John N. Clark.
4. "Summer Bird Life of Eastern North Carolina"—T. Gilbert Pearson.
5. "Change of Color without Molt"—R. M. Strong.
6. "Iridescence and White Feathers"—R. M. Strong.
7. Some Problems of Local Bird Population"—Walter B. Barrows.
8. "Notes on *Picoides americanus* and *Picoides arcticus* in Minnesota." Illustrated with lantern slides—T. S. Roberts.
9. "Comparison of the Bird Life of Gardiner's Island and Cobb's Island." Illustrated with lantern slides—Frank M. Chapman.
10. "A Contribution to the Life History of the Herring Gull." Illustrated with lantern slides—W. L. Baily and Wm. Dutcher.
11. "The A. O. U. Check-List; Its History and Its Future"—J. A. Allen.
12. "A Glance at the Historical Side of the Check-List of North American Birds"—Witmer Stone.
13. "Evolution of Species and Subspecies as illustrated by Certain Mexican Quails and Squirrels"—E. W. Nelson.
14. "Form in Bird Music"—H. W. Olds.
15. "Ancient Birds and their Associates." Illustrated with lantern slides—F. A. Lucas.
16. "Observations on the Herons of the District of Columbia. Illustrated with lantern slides—Paul Bartsch.
17. "Bird Life in the Bahamas." Illustrated with lantern slides—Frank M. Chapman and Louis Agassiz Fuertes.
18. "Reports of the Chairman of the Committee on the Protection of North American Birds"—Wm. Dutcher.
19. "Federal Game Protection in 1902"—T. S. Palmer.
20. "Some Variations in the Piping Plover (*Ægialitis meloda*)"—Jonathan Dwight, Jr.
21. "Nesting of the Red-bellied Woodpecker in Harford County, Md."—Wm. H. Fisher.
22. "Some Food Habits of West Indian Birds"—B. S. Bowdish.
23. "The Significance of Trinomials in Nomenclature"—Witmer Stone.
24. "An Epidemic of Roup in the Canandaigua Crow Roost"—Elon Howard Eaton.

A Robin in Barracks.

Editor Forest and Stream:

I noticed in the current number of the FOREST AND STREAM a communication under the caption of "The Murder of Young Among Birds," that recalled to me something that happened many years ago. I had been sent early in January of 1880 to Jefferson Barracks, Mo., just below St. Louis, to drill recruits there; it was the cavalry recruit depot then.

There is a large reservation here covered with forest trees, and I knew that the next spring these trees would be full of birds; this seemed to be a favorite place for them. I asked permission to put up boxes for them and was told to put up all I wanted. I made about fifty, some of them with large doors in them for my favorite, the robin; and every box had a family of some kind of birds in it the following summer.

One of my robin boxes I put up in a tree in front of our quarters, and a pair of robins took possession of it and raised a brood. When the young were half fledged, one of them fell out of his box during a rain storm, and a big Tom cat we had brought him into the barracks to make a meal of him.

I took the bird from the cat, and now took a notion to raise this bird myself. I could have put him back in his box, but getting an old cage I put him in it; then hanging it on the back porch began feeding him. He would eat a chunk of beef the size of his body three times a day if I pulled it apart and fed it to him. I never offered him anything except beer that he refused. I fed him about everything we would eat, from peanuts and candy to raisins and boiled prunes. He refused the beer, though. He had only been a few hours in this cage before his mother found him, and she began feeding him, but never tried to poison him. I scraped up an acquaintance with her, and after a time she would eat out of my hand. It may be that this is why she did not kill her young one, she knew I had him.

When he was full fledged I took him one morning and holding him out over the porch, let him go. He flew off and I expected to see him no more, but at dinner time I found him back in his cage again ready for his dinner. He occupied this cage all summer and soon found his way into the quarters. He would perch on a gun rack here and let any of us take him in our hands. I could call him, and have him fly on my shoulders to be fed; but he never would allow a woman to touch him.

He seemed to hate the English sparrows, and never missed a chance to whip them; he could whip half a dozen of them. He grew very large, on account of the food he got, I suppose, and stayed with us until late in the fall; in fact, I had about concluded he did not mean to go at all, before he finally left.

I left there the following spring before the birds began to come; but a friend wrote to me that among the first to come was my robin. He brought a mate with him. They took possession of the box he had been hatched in, then flew into the barracks and took his old place on top of the gun rack. He and his mate raised a brood here that year, and did not have to do much foraging for them, either, the men kept them supplied with plenty of boiled meat.

My friend told me that this robin of mine would put in whole hours in trying to get his mate to come into the quarters with him, flying back and forward from his box to the open window, then waiting for her to follow, but she never would come.

CABIA BLANCO.

A Columbia County Wolf.

THE Hudson, N. Y., Republican of Nov. 24, reports:

"The first wolf that has been seen in Columbia County in forty years was shot Friday near Lebanon Springs by William H. Hatch. This animal had been committing great depredations, getting into sheep folds and terrorizing the whole neighborhood. It was asserted by the farmers that it had killed probably more than one hundred sheep within the last three months. The animal had its haunts in New Lebanon and Stepentown, and in the latter town recently killed and partly devoured a calf. It became very bold lately, and on several occasions was seen in the open, but managed to elude the hunters who were in pursuit of it, until Mr. Hatch came upon it among his sheep. The first shot from his gun badly wounded the wolf, but it turned on the farmer and was ready to give him battle until the second shot in the breast took deadly effect. The wolf bounded in the air, and after giving a yelp, fell dead a short distance from Mr. Hatch, who did not lose his nerve, when a miss would have left him in a dangerous predicament. The farmers had clubbed together and offered a reward of $100 for the capture of the animal, and now that it is dead they will feel more at ease, as they were afraid to travel along the highways at night while the wolf was roaming about. It stood about three feet in height and weighed 150 pounds. Last Thursday it attacked a cow, which was lacerated so badly that it had to be killed. It is thought that the wolf had a mate, which will have to be killed before sheep and cattle in the neighborhood are safe."

[What proof is there that it was a wolf?]

Tame Adirondack Moose.

HAMBURG, N. J., Nov. 24.—I saw an account in yesterday's Sun of a tame moose at Newcomb, N. Y. I left Newcomb Oct. 23, and this moose appeared soon after that. A few days ago Mrs. J. M. Chase sent me two pictures of the animal. In one the moose is taking an apple from a lady's hand; in the other it is lying on the ground near the house. The moose has no horns, one ear lops, and there is a long scar or sore on the left shoulder. This is probably some tame animal turned out by Mr. Whitney. Newcomb is about thirty-five miles from Long Lake, west, near where the moose and elk were let go. These pictures prove that some hunting stories are true.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Experience with Pheasants.

EAST WAREHAM, Mass.—*Editor Forest and Stream:* The modern mowing machine is one of the juggernauts of small life, and the greatest sufferers are toads, frogs and mice; at the time for cutting hay the meadows fairly teem with these small creatures, but there are others which flee from the fearsome clatter, and seeking the thickest cover, naturally keep in the standing grass, and are roused up each time the circuit is made, their cover narrowing till none is left, and away they rush—cats, rabbits or meadow mice, and sometimes a black snake. These last, with others of their family, are often caught by the cutter bar and lose a portion of their bodies, if the division is well aft they may recover; if otherwise, they are doomed.

Nesting birds suffer much, for if the nest withstands the cross tramp of horses as one machine after another is used, and escapes the tread of wheels, its seclusion vanishes when the hay is raked, and the changed appearance with attending turmoil discourages the mother, who abandons the location, leaving eggs or young, as the case may be.

On the 7th of July last, while mowing a piece of stout grass, the cutter bar of my machine passed over a Mongolian pheasant sitting on eight eggs, so closely that the knives cut off her long tail. She sprang from the nest into the standing grass, and then flew to a nearby maple swamp. Stepping off the machine, I found five eggs unbroken, the others were mashed by the bird as she sprang up after being pressed almost flat by the bar.

There was no nest or depression whatever, not a shred of material had been contributed by the bird herself, and after the eggs were taken up no one would ever imagine that a nest had been on the spot. The long tail feathers mixed with cut grass, showed how close the call had been; that the bird escaped is explained by the fact that the fingers on the cutter bar turn up slightly, and on striking any lump tend to raise the knives and pass over. When this took place I was almost through cutting and had a baby rabbit in each of my two coat pockets. After cutting out the piece I placed the five eggs in my cap and performed the somewhat difficult trick of driving a horse, holding a cap with eggs and keeping a rabbit in either pocket with my elbows.

On my arrival home the children, with a young friend from the city, were delighted with the woodsie babies, and it was some time before they were willing to return them to their meadow and mamma. Afterward, while raking the hay, one little body was found mutilated almost beyond recognition as a rabbit; there must have been a litter of them.

The pheasant's eggs I placed under a very gentle bantam. In just 21 days she brought out the whole five. What next to do we did not know, so turned them out into the garden after 24 hours in their nest—a nail keg half filled with hay. The bantam was so gentle anyone could pick her up outdoors or in. They seemed to thrive for two or three weeks, then we missed one; it failed to come in at night. The hen came back to her nail keg every evening, until the little ones were large enough to fly, then she took them up on a high shelf in a shed built against the barn. When they were six weeks old a second one grew sick and died, the others have never shown any signs of sickness.

We fed them but little, the hen was an indefatigable scratcher and worked all summer in a hot bed and around the woodpile. This last had been on the premises some time, and one day I got a Portuguese to saw it up. When he got down to the bottom the hen and pheasants were on hand. When he raised a stick from the moist earth and chip dirt there were exposed a lot of black field roaches, angle worms and earwigs or myriapods that sought seclusion under it; then the hen and chicks rushed in and caught them. This wood was long-cut—not cord wood—and required two trestles to hold many of the sticks; this, of course, necessitated the man's walking back and forth between them, and the hen was often under his feet, and some of his time was spent in "shooing" and pushing her away, for, when he lifted up one stick others were likely to roll down on either her or the chicks. In this manner they grew up tame, coming into the outbuildings or house when a door was open.

They like flies and spend much time in the horse stall scratching in the bedding, not minding the horse. When it rains they come into the shed; it does not matter if men are coopering barrels and children playing I spy or tag; they will sit on the grindstone, a barrel or bench, and dress their feathers as unconcerned as their foster mother.

Some four weeks ago she began to wean them and commenced to lay in the same keg where she sat. They did not take to weaning, would not be weaned; she could not lose them; while she was in the keg attending to her duties they stood about with their necks stretched up and peeped dolefully.

At first, when the notion to fly struck them, the hen would fly with them—usually a short distance into the garden, sometimes across the road into a neighbor's corn field. Now, when they fly, she stays back, and they commence to peep as soon as they find she is not with them. These birds can be quite destructive to crops; they will eat tomatoes equal to domestic fowl, dig up beans, peas, and corn, and even scratch out potatoes. Whoever thinks of stocking a place with Mongolians should consider well beforehand what reception they are likely to meet when they spread about the country. In this town they are remakably plenty now, and are prized by the citizens generally; some few complain that they cannot raise peas or beans unless close to the house. How this will be in a few years is hard to say; the birds are in every field now; they are quite prolific, from six to fourteen eggs in a nest and two broods. They are hardy as the ruffed grouse, and from their greatest range, not being restricted to timber or brush, can support themselves better.

Our birds now eat all grains, corn in preference to any; they do not care for dough, but eat bread. I think they would be difficult to raise on artificial food in the manner of chickens; they must have a large percentage of insects, and only a hen can supply them.

I am not certain that these birds roost off the ground, and think mine were taught by the hen. I have never seen one alight in a tree.

Of the three two are hens; if they are monogamous I shall need another male, i.e., supposing they continue to stay about the place. Cock birds appear the most numerous from their brilliant coloring, catching the eye more readily than the duller plumage of the females. They also are more fond of the open, like to sit on fences, walls, haycocks and other posts of vantage; the hens are more shy and really fully as plentiful. How we shall hold out after 1905 if shooting is then allowed, is hard to say, but I opine that then we, who have cherished these birds and love to see them about, will see a crowd of aliens come in and clean them out before our faces.

If an open season is declared only landholders should be allowed to shoot them, or their permission should be required, a limit on the number and sex should be insisted upon.

These birds are the gift of one or two public spirited gentlemen to the community. They are singularly confiding and easy to approach; once open the season and market, goodby pheasant.

WALTER B. SAVARY.

P. S.—Since writing I have had to confine my birds, partly to save them from the army of irresponsible shooters and partly for fear they would go off with wild pheasants. A few days ago I saw a flock of females fly down to the salt water, while some alighted on the shore at the water's edge, two dropped into the grass—called "creek stuff" here—where the water was two feet deep; there they sat like ducks, their long tails well up until I put up the covey in my anxiety to see them.

W. B. S.

A Maine Center.

WATERFORD, Oxford Co., Me., Nov. 24.—Brown trout that were planted three years ago in the brook and lake here have thrived, and were quite plenty in the brook, spawning last of October. I caught one in August of 2 pounds weight. Lots of fine salmon in Muting Brook, a tributary to Bear Pond; a few have spear marks, showing poaching; they are natives. C. D. Morse shot a buck of 256 pounds, and a Mrs. Emmerson shot one of 201 pounds from her door, said to be at 40 rods. We would like to see Mr. Converse hunt foxes his style up here. These real and only sportsmen are now all in the South. Conditions and circumstances change them. A large black cat was caught in a trap recently, thought to be a "Jock cat."

E. PORTER.

Various Matters.

Editor Forest and Stream:

On my return recently from an Adirondack hunting trip, one of the first things which I did was to read up the back numbers of Forest and Stream, which had accumulated during my absence from home.

The pleasure I derived from the many good things which I found was nearly offset by the reports of recent fatalities in the deer forests, where men were mistaken and shot to death for deer.

I notice that the opinion seems to prevail that these fatalities are largely attributable to the use of small-bore high-power rifles.

I do not think this opinion is warranted by the facts in the case. Anyone conversant wth the characteristics of deer forests, or forests in which any sort of game is killed with the rifle, must be aware of the fact that bullets from high-power rifles which are fired in such forests are sure to be stopped by natural obstructions before they have exceeded the range of black powder rifles, which, of course, makes one type of rifle just as dangerous as the other. So far as I am informed, no more people have been accidentally shot with high-power rifles, in proportion to the number of these rifles in use, than by any other kind of rifle.

It seems somewhat strange to me that among all those who have attempted to give reasons for these sad accidents, none have mentioned what to me appears to be a very prolific cause, viz., whiskey.

A drunken, or a half drunken man with a loaded rifle, trying to still-hunt deer in a forest where other men are trying to do the same thing, is a very dangerous combination. It is a lamentable fact that many deer hunters regard the whiskey bottle as a necessary adjunct of their trips, and these trips as the time of all other times in which to give unbridled license to drinking.

It is not my intention to deliver a temperance lecture, but I will simply say that I think this order of procedure should be exactly reversed, that whatever may be a person's habits in this respect ordinarily, he should abstain entirely from drinking spirituous liquors while on such trips. The terrible consequences which sometimes follow should make it unnecessary to say more on this point.

Another mistaken idea is that the aim of these man-killers is invariably fatal when shooting at the human target.

If this were true I would not now be alive as a witness to the contrary, as I have figured in the capacity of a target for a half drunken still-hunter. In the comparatively few cases where the aim is fatal we necessarily hear all about it, but we hear little or nothing about the many cases where the aim is poor, hence the mistaken opinion.

I do not wish it to be inferred that I think whiskey is responsible for all of these accidents. A very small percentage of them are no doubt genuine accidents, of the sort that sometimes will occur when the greatest precautions are observed.

Then many are the result of carelessness or inexperience, pure and simple.

I remember one of my hunts which was taken in company with several would be still-hunters, who were not only novices in this art, but also in woodcraft. I do not remember the number of stumps, rocks, and other inanimate objects which they shot, mistaking them for deer, bear, panther and other wild animals. Luckily on this occasion the stumps and rocks were the only things which these hunters shot by mistake. It has been a practice with me of late to hang a placard over the gun rack in camp, bearing inscriptions which I designate as the 11th and 12th commandments.

The 11th commandment reads, "Thou shalt not have loaded firearms in camp." The 12th, "Thou shalt not shoot at anything until thou art absolutely certain what it is." This works well.

In regard to Adirondack deer. I have hunted deer in the Adirondacks nearly every season for many years, and have found them more numerous each season than the preceding one. Even Saratoga County must now be regarded as a deer inhabited country, as they are now frequently seen in many parts of it, and quite a good many have been killed this season within its limits. For the fifty years previous to 1890, deer were never seen in a wild state in this county. During my recent trip our party of ten still-hunted on dry leaves and under other adverse conditions, and killed 13 deer in ten days' hunting. This does not indicate a scarcity of deer. It is true that a large number of deer are killed in the Adirondacks each season, and this gives the alarmists a basis on which to predict the early annihilation of Adirondack deer. They seem to forget that a much larger number is added to the supply each year by natural increase. I can see no present necessity for greater restrictions in regard to killing deer, but as a matter of economy I think the open season on deer should be changed so they could be killed only when they are in the best condition and when their meat could all be utilized to the best advantage. A deer is a large animal, and when one is killed during warm weather the chances are that before it can all be consumed it will be more suitable food for buzzards than human beings.

We found it quite difficult during out late hunt, to keep the deer we killed from spoiling, although they were all killed in November. I have always thought that the open season on deer should be from the first to the last of November, for I have always thought that game should only be killed when it is in the best condition, and when its meat could be used to the best possible advantage. This may sound strange to your able and interesting correspondent, Coahoma, coming from me, and therefore I will explain myself by saying that in my opinion we derive our "true sport" from the pursuit and capture of game. The utilization of the meat of captured game is purely a question of economy, and bears no relation to the sport involved in its pursuit and capture.

Apropos of this matter, I would suggest to Coahoma that quite likely his friend B. objected to throwing those thirteen quail into the bayou for the same reason that he would object to throwing the contents of his pork barrel into the same bayou. But his objection to this needless waste would be no evidence that he regards the slaughtering of hogs as "true sport." But enough.

I like Coahoma, and the loyal way in which he defends his honest convictions.

In regard to hounding deer. I have always thought the law against hounding a little too hard on those who can kill deer in no other way, or those who enjoy this way of hunting deer best.

Personally, I can kill five deer still-hunting while I would be trying to kill one driven by hounds, and I derive more sport from still-hunting than from any other method of hunting deer; but I believe that all have an equal opportunity to enjoy sport in the way that pleases them best, provided their way is a sportsmanlike way. I can discover nothing unsportsmanlike in hounding deer. The charge that it is cruel is the merest bosh. Deer are never found in situations where they cannot throw off the hound by crossing water before thay are distressed by the chase.

If the supply of game cannot stand the drain of this method, stop all hunting for a term of years until the supply is replenished. This would be very simple and effective, and perfectly fair to all interested. It would also be much less expensive than our present system, which, expensive as it is, stops far short of enforcing the law against hounding and jacking.

Lastly, if hounding were permitted, it would greatly lessen the number of fatal accidents, as that class of deer hunters who have none of the instincts and training of the still-hunter, would then pursue the sport in a way that offers but few chances for carelessness, in experience or intemperance, on their part to result in the injury or death of their fellow men.

Jos. W. Shurter.

Gansevoort, Nov. 26.

Mr. Brown and the Buck.

"Tell us about that big buck deer you lost once, Brown. They say you missed a very fine one a few years ago," said Jones to Brown a few evenings since.

"Well, it was like this," said Brown, taking a few puffs at his pipe. "I had never shot a deer and the evening before the occurrence of which you speak, I was alone in a log cabin far away from the haunts of men. I was figuring on taking a turn out in the thicket the next day to look for deer, which I had been told frequented it, and so naturally thought a good deal about deer and the probabilities of my being able to get one. If you have ever been domiciled in a cabin in the woods several miles from any human habitation, you can readily understand what the facilities are for undisturbed thought. By the time darkness came on I was shooting deer by the carload. Sometimes I would be content to kill them one at a time in rapid succession, and then, again, I would have them lined up and make one bullet do for two or more, but I never failed to bring them down. Amid these cheerful reflections I fell asleep and dreamed of sitting on runways and prowling through thickets. The next morning I started out full of hope and ambition. Every faculty was on the alert and my gun always in readiness for instant execution in case a deer jumped from the thicket. For a couple of hours I traveled thus, and seeing no deer, gradually relaxed my vigilance, and was swinging along at an easy gait with my gun carelessly resting on my arm. I had come out of the thick timber and had stopped on a hill overlooking some little meadows. I had not the slightest thought of seeing a deer, when all at once there burst upon my vision a monstrous buck calmly and peacefully grazing along the edge of the meadow at the foot of the hill. Instantly I was again a child, and by my father's side I stood clinging to his hand and gazed respectfully through the bars of a cage at the beautiful animal. Then the whole thing seemed like a picture of a beautiful landscape, with the live deer painted into it. Gradually I became conscious of something on my arm. It was the gun, and then the horrible revelation came over me that here was the deer I had come to kill. Slowly and mechanically I raised the gun to my shoulder and pointed it in the direction of the meadows, always with my eye riveted on the deer. I could not shoot yet, for I had not made up my mind how I was going to keep him there while I killed him; how I could spare enough attention from keeping him chained with my eye, to aim the gun and perform the operation of pulling the trigger. Those were moments of terrible suspense. The deer kept growing larger and larger, a mist swam before my eyes, and the earth, the trees and the sky all began to move. With the sensation that one has when he realizes that it is the other train and not the one he is on that is moving, I awoke to the fact that Mr. buck was leaving the meadow with my eye still chained to him. It was then or never. There he was only a short distance away, moving slowly along. I can see him yet. Great big fellow. His course brought him nearer and nearer to where I stood waiting"—(pause)

"Why didn't you shoot?"

"What?"

"Why didn't you shoot?"

"Oh. Why didn't I shoot. Well, as I said before, I had one eye firmly fixed on the buck. In order to sight a gun properly, as you may know, it is necessary to shut one eye, and with the other glance along the gun barrel between the sights. My gun was in place, but when I went to draw a bead on the buck my left eye being so firmly fixed on the buck, refused to respond, and I inadvertently shut the other eye. This moved the gun barrel around out of place and changed the position of the deer and mixed things up generally. I had been perfectly cool up to that time. Almost too cool. In fact, frozen, to speak technically, but this little matter of getting my eyes changed had a tendency to make me nervous. I quickly recovered, however, took aim and fired. I cannot imagine why he did not drop. They always dropped—the night before. He simply stopped and looked my way. Could it be that I had shot him so dead that he did not struggle sufficiently to fall at once? No, he was not dead. He did not even know he had been shot at, and to my utmost consternation he came directly toward me. He came a little way and stopped. How long we stood there staring each other in the face I will never know, but finally it occurred to me that if I killed him I must shoot him again. I raised my gun"——

"Why in the world didn't you shoot then, Mr. Brown?"

"Did you ever shoot at a deer?"

"No."

"No? Well, you see, when I made up my mind to shoot again it occurred to me that I hadn't pumped my repeater. I hastened to reload, when click! the deer wheeled like a flash, and with a gentle, graceful rolling motion sank quietly and peacefully into a kind of little ravine like, and I saw him no more. If the ground had been a little more level, or if —— (sigh). Say, give me a match, will you, my pipe's gone out."

With Dog and Gun.

The Delights of Upland Shooting.

There is no sport that has more pleasurable, health-giving qualities than that which appertains to the dog and gun. To roam at will through forest and glade, inhaling the purest air that nature provides, air laden with the scent of wild flowers, heavy with the balsamic odor of the pines, refreshing and exhilarating, giving breath and strength to the weakling and preserving those qualities in the strong. No scenery is more beautiful than that made by the divine landscape gardener, unmarred by the hand of man, whose desecrating hand strings rows of unsightly fences, rears an edifice of wood and mortar and stone in the clearing in the forest, once beautiful in its pristine freshness, but now an unsightly blot upon the face of nature. In the heart of every man there is one little spot, sometimes so infinitely small that even its possessor is not aware of its existence until moved by some glorious scene, and sometimes so large that it dominates the whole being, that loves the wildness, the freedom, the untrammeled beauty, found in the silent woods. And it is that love for nature that goes far toward making a sportsman. To leave the rush and turmoil of the town far behind, to get away from the confines of civilization and feel as free from care as the beasts of the field, the birds of the air, that is the longing that completes the change from man to sportsman. With many the hunting is merely an incident, to be enjoyed as one of the numerous pleasures that go to make the whole; it is the companionship of the beings of the woods, the animals that know nothing of civilization or captivity, the sense of being free, the wholesomeness of the life, that attracts the man.

Did you ever lie on your back on some mossy spot, beneath the trees, and gaze upward at the blue sky, taking note of the little birds that flit in and out of the foliage overhead, now hastily seeking the shelter of the thick pine when a threatening shadow warns them of the coming of their most troublesome enemy, the hawk; then, when danger is over, leaving their refuge and once more busily going about the duties of their little lives? You hear a faint scratching noise on the old fallen tree near you and then you see a tiny chipmunk watching you with twinkling eyes, a strange sight for him, resembling none of the wood folks with which he is acquainted, until a sudden movement of yours alarms the timid creature, and like a flash of light he is gone. Off in that tall chestnut tree there sounds the busy chatter of a squirrel, a bluejay catches a glimpse of you and screeches forth harsh notes of warning, while a distant whistle, a querulous quói-la-hee, quói-la-hee, proclaims a quail, separated from his relatives and sounding the call of the lost.

There is something irresistibly attractive in these sights and sounds of the woods that the maxim, "once a sportsman, always a sportsman," is rarely at fault. It is generally instilled when but a boy, this love of nature, and seldom a man, who as a youngster used to roam through the woods and fields, but that enjoys the same wanderings in his riper years.

Upland shooting gives one an opportunity to enjoy all these pictures from nature's book of field and forest, and that accounts for the man turning sportsman and the sportsman naturalist. No one passes a week or even a day in the woods without becoming interested in the animal inhabitants, and a desire to know more, to acquire a knowledge of the heretofore unknown wood lore, draws them again and again to the shadows of the silent forest until the charm is too strong to be resisted and many an hour is pleasurably spent beneath the trees.

Nor are all the attractions confined to the woods. The sportsman-naturalist wanders through the fields, sees the burrow of the woodchuck, the well-defined paths of the rabbit worn smooth through grass and stubble by the passing of many little feet. Under the branches of the oak tree in the corner of the lot are several little hollows in the fresh earth, the dusting place of Bob White, while the feathers scattered here and there about the spot prove that the daily dust bath is not neglected. Never a day is passed without some new and interesting scene to relieve the monotony, the book of knowledge is never all revealed, but day by day the wanderer looks upon a new page, and before he is aware of it is under that strange spell, the "spell of the forest."

Give a man a dog and a gun, let him roam at will through the fields and woods, and unless his heart is harder than the hardest flint, his eyes shut to all the beauties and charms of nature, he will be inspired by the delightful views, the new sights and purest air God can give, and go home, happier, better and healthier, surely recompense sufficient to pay for the day spent away from town and business.

It was not so many years ago when the man who loved the pleasures attendant upon dog and gun, in a day afield, was regarded by the majority of people as a ne'er-do-well, an idler who it would be best to watch, and maybe you can remember how you slipped out the back door with the gun concealed beneath your coat, acting as if you were a criminal instead of a respectable citizen who was going hunting, afraid of the remarks of your neighbors if they saw you off for such degrading sport and never perfectly at ease until beyond the confines of the village and the scrutiny of curious eyes.

However, in this more enlightened day the sportsman is not a creature of suspicion, but, if a sportsman in the true sense of the word, he is respected, admired by many and imitated by some, truly a different man from one of three decades ago.

The American people, as a whole, are a nation of sportsmen, and with a sportsman President at the helm, upholding and dignifying the title, the multitudes are becoming more and more convinced that the love of sport is an excellent quality to be instilled in each mind, for it is

rare that a genuine lover of the rod or gun is not worthy of all trust and confidence imposed in him.

So let us don our shooting togs, the coat, not of many colors, but of many pockets, the trousers and leggings made to resist the wear of the bush and scratch of the brier, and with gun resting comfortably on the shoulder, hide ourselves in the peaceful shade of the woods, or tramp over the crisp stubble with that pleasurable anticipation of a good day's sport that is never lost, but each day rises anew, whatever the disappointments of the preceding one.

The companion of many hunts, our Fidus Achates, in the shape of either a setter or pointer, is as eager as his master to be afield, and upon reaching the well-known hunting grounds, is off at a wave of the hand, quartering the fields, drawing each favorite spot where only the other day he found a bevy. Suddenly a whiff of that delectable bird scent is carried to the delicate nostrils and he slackens his gait, looks around for the master, and then, with head erect and putting each foot down as carefully as though he were treading on glass, he approaches the birds, until the strong scent warns him of their nearness, and pauses, rigid and beautiful, surely a sight that brings joy to the heart of the sportsman.

Hark to the whir of wings as the quail arise; watch the startled birds hurry to the shelter of the neighboring woods. The first bevy of the day is found, and now our cup of joy is overflowing.

Then at noon time, when the sun is high in the heavens, the sportsman seeks some sheltered nook and abandons himself to a delightful rest, and also refreshes the inner man with a tempting, though necessarily small, lunch, which was so carefully prepared and put into a pocket of the canvas coat by the little madam, who, although she is a sportsman's wife or mother, and has witnessed his coming and going many times, can never quell the feeling of uneasiness and always on parting utters those precautionary words, "Do be careful, dear." Bless the little woman! We all know what prompts those loving words, but we do not know how much she worries or how anxiously she awaits the homecoming.

The clear waters of the near-by brook serve to wash down the enjoyable lunch and also to soften the two or three dog biscuits that somewhat still the pangs of hunger in our faithful companion's stomach. His breakfast was not a large one, for the sportsman was wise and knows that no dog can hunt well after a hearty meal.

But there is one thing needed before the sportsman's satisfaction is complete. A search in the pockets brings to light a well-filled tobacco pouch and a pipe, whose very blackness proclaims a strength which only many pounds of the "weed that soothes" could produce. The pipe is carefully filled and then there is another search for a match, which is found, lit, and applied to the tobacco. Now he is happy as he lounges on the soft bed of leaves and pine needles. At peace with all the world is he, as he watches the circling smoke around and muses on the pleasures of the past few hours.

Perhaps the warmth of the November sun, as its bright rays shine into the little glade, has a soporific effect on the sportsman, and soon he is off to the land of dreams, accompanied by the dog, who has before been lazily dozing, but now, seeing his master embraced by the arms of Morpheus, curls up in a comfortable little hollow at the foot of an old tree and indulges in a deep, beneficial snooze.

All this may seem a bit out of place to some, this noonday slumber, but to the man who finds not all the pleasure in always "killing," it is as truly a part of the day's enjoyment as the shooting.

Surely we who love the dog and gun, can claim as good a right to be termed contemplative sportsmen as those who find their pleasures in bending rod and babbling brooks and have been designated by the father of trout fishing, as contemplative anglers.

But the sun has withdrawn its warming rays from the glade, and the old dog, who quickly notices the atmospheric change, begins to get uneasy. He indulges in a mighty, satisfying yawn, and then lazily arises from the soft bed beneath the tree. The sportsman is suddenly recalled from the land of dreams by a cold, damp nose being shoved inquiringly into his face, and awakens to find his dog standing by him, an entreating look in the large brown eeys, which seems to say, "'Tis time to be up and doing." So he looks at his watch and finds that there are only three short hours before the sun will sink behind the western hills, and that that day and its pleasures will be a thing of the past.

Off in the distance he hears a clear, melodious whistle. A bevy of quail have been scattered and are sounding their assembly calls, so he listens for a moment until another whistle leaves him certain of the direction, and then off he goes, for a half-dozen more birds added to those that are already in the game pockets will just complete the number he wishes to carry home.

Finally the dog gives the most positive signs of game, the sportsman moves up closer to where he is working, there is a sudden rustling of the dead leaves, a b-r-r-r, followed by a sharp report of the gun, and another victim swells the score.

Again the scene is enacted. Maybe the surroundings are different, for in nature's theater the scenery is always shifting, but there are the same actors, the man, the dog, the fluttering bird and smoking gun.

The sportsman is at last compelled to cease hunting, for the gradually deepening dusk, makes it impossible to shoot with satisfying results, and he calls his dog to heel, throws the little gun over his shoulder and starts on his homeward tramp.

"Fatigued?" you ask. "Yes, bodily." His limbs are not of steel and have conveyed him over many miles, through forest and field, but his spirits are not in keeping with the weary limbs. He is not thinking of the work he has done, the miles he has covered, but of the dozen or more plump quail that are so snugly resting in the game pockets, and should you ask him if the recompense is worthy of the labor, there will be no hesitating, the same cheery answer will be always given, "Of course it is. Why, my friend, there is no better sport, and I am never happier than when homeward bound after a successful hunt."

One Way to Burst a Gun.

WE were firing at the 300-yard target, using new Spencer .45 caliber carbines. These are rim fire and some of their cartridges were defective, the percussion matter, whatever it was, often failed. It may have been on account of its not being evenly distributed, for if it missed fire the first time we turned the cartridge partly around, then let the plunger strike it in a new place, and it generally exploded then.

One of our sergeants stepped out to fire this day, and his first attempt was a failure; his cartridge did not explode. He turned it; then tried again, and this time the percussion was all right; but the gun made hardly any report, and I noticed but a light puff of smoke come out of the muzzle.

The marker signaled a miss, and the sergeant tried again. This time the cartridge was all right, but after firing the gun was found to have a small bulge that extended clean around the barrel an inch behind the muzzle. This was over twice the diameter of the barrel, but there was no split about it. The lieutenant, who had charge of us, here now examined the gun, then wanted to know if the sergeant had taken the rag out of the gun before firing. A good many of us kept a greasy rag in the muzzle as a stopper, and only a few days before this a man had forgot to remove his before firing at a deer and had ruined his gun; the barrel, in this case, had split two inches back from the front end.

There was no rag in the gun; sergeant said this had been his second shot, the first one would have burst it had he left his stopper in.

"Then I can't account for it," the lieutenant told him.

I had been standing only a few feet away when both shots were fired and had been busy thinking since then. "I can explain it, I think." I told him that first shot was one of those spoiled cartridges; he had to turn it, then, when it did go off it made hardly any report; there must have been only powder enough in it to drive the ball as far as the muzzle; there it found the smallest inside diameter and then stuck; the next shot burst the gun, of course.

"I think you have got it," he told me. "Have you ever seen a similar case?"

"No, sir; another like it might not occur in a year, but I reason it out that way."

"And that is the way it has been done. I must report this to the War Department as being something new."

I saw another of these carbines burst from having its muzzle full of clay; that was a piece of carelessness, though, and had I anything to do in this case the man would have had to pay $22, the price of the gun.

CABIA BLANCO.

ERIE, Pa.

Ducks on Gaede's Pond.

ONE afternoon last week a man rushed into Morgan's office on Broadway. When he inquired for Eddie it was plainly to be seen that the messenger was very much excited. The proprietor was not at home, and the man waited.

When Eddie came in the man took him over in a corner and whispered something in his ear. The people in the place could catch a word now and then about ducks and ponds, and Eddie seemed pleased over the information which was being imparted.

After the man had departed, Edward went to the telephone. His actions were quick and decisive, but his friends saw that he was under strong mental excitement.

"Hello, Central," said Edward, as he took down the receiver. "Give me 380, quick."

There was a delay for a moment, and then Morgan whispered into the 'phone:

"Hello, Powers, is that you? Say, John, a fellow's just been in and told me that there is a big bunch of wild ducks up on Bob Gaede's pond, just above Haledon. I want you to hook up your horse before daylight to-morrow morning, and we will go up and get them before Garry Hopper or Billy Stalter get wise. If they hear there are ducks on that pond, they will go up and camp out to-night."

"All right," said Ed, after he had listened to his friend Powers for a moment. "Be sure and be here by 5 in the morning; we won't have any time to lose if we want to get those ducks. Keep it mum; don't say a word to any one."

For the balance of the evening Morgan acted as if he were burdened with the weight of a great secret. His friends noticed his absent-mindedness, and it caused considerable comment. When Garry Hopper came in and said he had heard there was a big bunch of ducks up country Eddie got nervous, but he calmed down when Garry said the ducks were on Cedar Pond at Orean Park.

The next morning when the police were going on duty at 4 o'clock, a man was noticed driving through the streets at a rapid gait. He pulled up at Morgan's and Eddie came out, loaded down with shells and gun, which were hastily concealed in the back of the wagon. Then they whirled away over the river and up the Haledon hill.

"If we find those ducks, John," said Ed, "we will have to be pretty careful, as they will be apt to be wilder than hawks. If they are near the shore, we will sneak up from two sides. We'll put the first barrel into them on the water, and then when they bunch on the rise we will simply slaughter them with the second barrel. We'll certainly have the joke on Hopper and the gang by going out and getting a bunch of wild ducks right here in the town before breakfast."

When the hunters reached the top of Jackson's Hill, the pond on Bob Gaede's estate lay spread out before them like a mirror. Dawn was just breaking, and the surface of the water was partially hidden by the early morning mist. When they were within three yards of the lake, Powers suddenly stopped the horse.

"There are the ducks," said John, pointing to a group which was floating about thirty yards from the shore, at a point where there was good cover on the bank. "I think, though, they are tame ducks."

"No, they're not," said Morgan. "They're mallards; look at their size and see them swim. We won't do a thing to them in a minute. You go over to that point, and I'll go yonder; when I whistle blaze away."

It took John and Eddie fifteen minutes to get to their respective positions, and all the time they kept an eye on the ducks. Then there came a low whistle, and the simultaneous reports of two guns broke the morning stillness. The shot churned the water into foam right in the middle of the batch of ducks, but they never moved.

Neither Morgan nor Powers shot the second time. They got wise quickly. They sneaked back to the wagon, and the horse had to make record time to get back to Paterson before people were up.

Morgan says now that he knew all the time that the ducks were decoys which had been placed in the pond by Bob Gaede to fool some of his friends, and that he only pretended that they were real ducks in order to have a good joke on Powers.

Curiously enough, Powers says the same thing about Morgan.—Paterson (N. J.) Chronicle.

Market Hunter Fined $360.

Editor Forest and Stream:

Game Warden George A. Ferris, of Stamford, Conn., did a clever piece of work when he arrested and convicted Wallace A. Stevens, of Stamford, Conn., for selling thirty-three quail, woodcock and partridge.

Stevens received the minimum fine that the law provides, viz., $10 per bird, and $30 for costs—$360 in all. Upon first reading this fine may appear excessive for the first offense, but when other circumstances are taken into consideration, the decision will meet the approval of all good sportsmen, and it's the general sentiment in and around Stamford that the fellow got what he deserved. Stevens' occupation is that of driver for the Diamond Ice Company in Stamford eleven months in the year, but the twelfth month, October, he gives up his position and goes back into the country to a camp of his, or else boards at a farmhouse, and takes up shooting as a business. This he has done for several years. Several complaints have been made to the game warden about Stevens shooting on Sundays, and about his shooting for market; but all such fellows are shy, and it is hard to get positive evidence to secure a conviction on, and Stevens had made the statement several times that "Ferris never would catch him, and he would just like to see him come up and arrest him."

Game Warden Ferris is, however, not only an enthusiastic sportsman, but a man of much determination and resource; and after several weeks of patient investigation—the watching and noting of several persons with suspicious looking baskets who went to New York pretty frequently—the following of persons to New York and ascertaining where the contents of these suspected packages and baskets were disposed of, he was able finally to obtain positive evidence, had the warrant issued, and went up personally and arrested Stevens.

Assistant Prosecuting Attorney Jenkins conducted the case for the Commonwealth; Judge Downs presided. Judge Downs, in giving his decision, explained that the maximum fine was $50 per bird, and even imprisonment, and the minimum fine was $10 per bird, which he imposed, as it was Stevens' first offense before the court.

Mr. Ferris has received complaints of several other parties who are shooting and selling game illegally, and has them under consideration. There are several persons in that town, and, in fact, in almost every town in the State, who encourage shooters to violate the law by offering to buy the birds of them, and it is stated that a New York broker who resides in Stamford, bought a gun and gave it to a man who is known as a market shooter—gives the fellow his ammunition and takes his birds, and the presumption is that he quietly pays him for his time and game.

The good work of Game Warden Ferris will give some of these persistent market shooters a more wholesome respect for the game law, and such work will receive the hearty commendation and congratulation of sportsmen throughout the State of Connecticut.

N. S. A.

BRIDGEPORT, Conn.

On Staten Island.

PRINCE'S BAY, N. Y., Nov. 24.—*Editor Forest and Stream:* In the last issue I read an article about shooting in Greater New York. The article was a good one. The man who wrote it is in my estimation a gentleman, and he was in the bounds of the law in all his doings. We all like to hear of a man going out and doing an honest day's work with his rod and gun. It is good reading. If the pages of FOREST AND STREAM were supplied with all of the illegal shooting that has been done on Staten Island this fall it would make a great many columns of reading that would not suit a good many men. When I say men I mean gentlemen, not gentlemen of wealth, but those who are possessed of means that are worth more than would enable them to stand in a police court and deliberately lie about their wrongdoing when pushed to the wall (of injustice).

The casual reader may say, Why is it that there is so much illegal shooting on Staten Island, and why do they not make arrests? We have made arrests, and have gone through the form of prosecution, and all that; but we have had our drawbacks. We have a good prosecuting attorney, a man sincere, honest, and a thorough student of the game laws; but when he runs up against a wall thicker than seventeen Killarney castles, how under the sun can he knock it down single-handed? The Richmond County Fish and Game Protective Association have been keeping an eye on all of the proceedings, and have noticed several cases where the education of the lower class can be benefitted. When I speak of the lower class, I do not mean anything detrimental to any one. I am speaking of classes. We all know that there is the infant class, the primary class, grammar school and high school. Now, there is a high school in all classes. Take dogs; some belong to the high school class; and horses, there are the high school horses; they can step to music better than some men can step or stoop to common sense. But such people generally will stoop to common cents, if they think it will go. And I thank God that there is a high school in our courts that throws away petty politics and scorns the evildoer, and throws the searchlight of justice to help law-abiding people. We are going to the higher school of justice, where the faculty have been educated to the laws of the State.

A MEMBER OF THE ASSOCIATION.

CHICAGO AND THE WEST.

Game Law Matters in Illinois.

CHICAGO, Ill., Nov. 29.—State Game Commissioner A. J. Lovejoy, of Roscoe, Ill., favors this office with the following statement of matters and affairs connected with his administration:

"To set you at rest regarding what the State Game Commissioner is doing, I herewith hand you a little synopsis of the forthcoming report to the Governor. The cause of the delay in report is that it is almost impossible to get a deputy warden to answer any questions regarding his work, and I wished to make the report as complete as possible.

"At the commencement of my appointment there was in the State game fund the sum of $1,967. The last General Assembly, in trying to revise the game law of Illinois, inadvertently left out the word 'quail,' which has caused some to attempt to kill them at all seasons, instead of waiting till Nov. 1 to Dec. 20. Notwithstanding this error in the present law, we have succeeded in protecting them fully as well as ever before by enforcing Section 29 of the law, which forbids any to hunt on the lands of another without first procuring permission, etc., under penalty of prosecution for trespass. I am reliably informed that there has been less violation than usual. There has, however, been something over one hundred prosecutions for violations of the law during the fiscal year. In nearly every case we have been successful in fining the violators. Beside these cases under the State law, the report shows that there has been seized under the Lacey law numerous packages of game illegally shipped into the State from States forbidding the shipment of game beyond their borders. As required by this law, the game so seized has been sold for the benefit of the State Game Fund, except such portion as goes to the deputy making the seizure. The cases have been turned over to the U. S. Government for prosecution, and we are informed that Illinois stands at the head of the list of States for this work, and has made the best record of any. The licenses granted to other States to hunt in Illinois during the open season have also been more than ever in the history of the law. The larger number coming from St. Louis, with Burlington, Hannibal, Quincy, Dubuque, Indiana, Wisconsin, etc., following.

"To show that we are doing business and reporting the same, the game fund in the hands of the State Treasurer on June 1, 1902, showed a net balance of $6,204.90, instead of the small amount of $1,967, when the office was turned over to me. This was a net profit to the State of $4,237 over and above all expenses and salaries for the year.

"I merely send you these figures to quiet your nerves and to show that a game commissioner can attend to his busines and do right without running around to the newspapers telling of it. I have noticed two or three slurs about the game commissioner in your paper that were entirely uncalled for. Trust this will ease your mind till the complete report is out of the hands of the printer, and show that things are in good shape.

"I am as anxious to see a better game law enacted as you are, and am trying to get the assistance of the sportsmen in the matter, as I believe they are the best men to know what is best for the protection of game."

I am sure these figures are received in proper spirit and promise Commissioner Lovejoy that no one will be unduly nervous. It is a matter of much congratulation to the commissioner to see the good financial showing. Cash on hand is always good. I am in ignorance of what is meant by "slurs about the game commissioner." I am sure there is no department in FOREST AND STREAM which would not rather print praise than blame. The State game wardens can do no greater service to the cause of game protection than by giving publicity, not only in the sporting papers, but in the daily papers of the country to all the workings of their offices. There are plenty of men who would rather pay a fine than be held up for criticism before the public. The power of the press in enforcing the game laws of the country is well nigh as great to-day as the executive arm of the law itself, and it could be made much more powerful did the officers appointed to enforce that law avail themselves of the friendship and good offices of their natural allies, the newspapers. I know Commissioner Lovejoy will do this, and shall thank him always as now.

The Law in Indiana.

I had occasion to call attention to the ease with which one may borrow the non-resident license of a friend for the purpose of shooting in the State of Indiana. To-day I heard of another way in which to escape the penalty of this law. Say you want to spend a few days shooting on the Kankakee, where the duck shooting has been better this year than it has been anywhere else, and better than it has been for many years in the State of Indiana. Very well. You write to the office of the State game commissioner stating your real name and enclosing the fee for a resident license, and giving your address as Hammond, Ind. Then have your license sent in care of a certain friend at Hammond, Ind. When you go shooting your friend meets you at Hammond and hands you your license. After you are across the line you become a resident of Indiana. The wardens do not know you as anything but a resident, and naturally they do not want to take chances of making a mistake. In this way several Chicago men have made themselves residents of the State of Indiana for the time being. I simply call this to the attention of the State game warden, who is apparntly in ignorance of this state of affairs.

Ducks.

We have had an unusually good duck season and one more than ordinarily long. There has been no freeze up at this latitude as yet sufficient to shut up the waters, and old marsh shooters say that the best of the shooting is yet to come. With this dictum I hardly agree, but believe that one could expect good mallard shooting along the open waters of the Kankakee quite up to the time of the final freeze. Out in Minnesota, at the latitude of St. Paul, all the lakes have been frozen for some time and the ducks have left that country.

By the way, can anyone advise me of good duck and quail shooting in the State of Arkansas, and can anyone tell me what is the attitude in that State to-day in regard to the non-resident shooter? I have understood that Arkansas and Missouri are not hankering for non-residents. For some reasons I do not in the least blame them.

The License Law.

There is considerable discussion in this part of the world now over the question of non-resident licenses. The situation has grown so urgent that shooters are not always bold enough to openly violate the laws of their sister States. Hence we hear the cry that the non-resident license law is unconstitutional, that the State cannot charge a non-resident any more than it charges a resident for the privilege of shooting, etc. This is open abandonment of the doctrine that the license fees go to swell the revenues of the game protectors. I think any one who knows the sentiment of the legislators of the Western States will agree that so soon as we undertake to put a gun tax of even 50 cents a gun, or a shooting license of even $10 on our statute books, we shall see every game law wiped off of those statute books by the hands of an irate Legislature. If you put the price down to $1 or $2, you will come near enough to doing this same thing; and if you make it an even price for shooters of all the different States, you will not get enough money into your fund to materially benefit you in the enforcement of the laws. There are some who think that the non-resident license laws as they stand are good. Others would like to see the non-resident tax not above $10 in each State. Others again, begin to howl that they want no tax at all. I am afraid that the trouble with the great North American citizen John Jones, is that he wants protection for John Jones, but not for the game birds. The American people do not deserve to have any game, and the probability is that they will not long have any.

The Deer Season.

As I wrote last week from St. Paul, the returns from the deer hunters had not at that time begun fully to come in. Since then many of the hunting parties have come out of the woods, and they for the most part bring with them substantial proof of the abundance of game in Minnesota. Early last week one Great Northern train brought down 128 deer to the city of St. Paul. On board that train was one party made up of Frank Nordstrom, Gus Rylander and F. Nelson, who were returning from a trip of two weeks in the country between Vermillion and Rainy Lake. They had one moose, nine deer, two bears, and 125 partridges. Now, if any of our Canadian or Maine friends want a little record, they might cast their eyes this way. I fully believe that Minnesota is as good a game country as Maine, were it equally well systematized, mapped, tabulated and ticketed.

Two St. Paul policemen came down last week from a hunt in northern Minnesota, and each of then had a good moose, with good antlers. This is the third hunt which these men have made in Minnesota, and they have got a moose each time. Well posted hunters of St. Paul insist that it is as safe a proposition to get a moose in Minnesota as it is anywhere on earth.

In Wisconsin the deer law seems to work fairly well, at least in the city of Milwaukee. Mayor Rose, of Milwaukee, was out hunting last week and brought home with him a nice deer, which was left in the express office by the mayor when he arrived in Milwaukee. The next morning he sent his license and an order for the deer to the express office, in care of his butcher. The game warden was at the office and refused to honor the order of the mayor of the city, so the latter had to go down to the office and check up like anybody else. These Milwaukee wardens have been very vigilant and have gotten themselves very much disliked by reason of their efficiency. There have been several cases of game taken from parties coming through to Chicago, and they have come pretty near establishing a reign of terror among the unregenerate.

Not so much could be said for some of the settlements further north in the State of Wisconsin. A Stevens Point, Wis., dispatch has this to say as to a seizure lately made at that point:

Utter disregard of the game laws has characterized the operations of hunters and game dealers in the central and northern part of the State. Several large confiscations have been made, but the largest one was made in this city yesterday by Game Warden Brown, in which he secured more than 400 pounds of partridges and venison. The find was made in searching a Wisconsin Central refrigerator car. One consignment of 250 pounds was billed from Spencer as "dressed poultry," to Lepman & Haege, Chicago. One barrel was packed at the top and bottom with domestic geese, but in the middle were twenty-eight partridges. Another consignment of "dressed poultry" billed from Colby to T. J. Holing, Chicago, consisted almost wholly of partridges. Saddles of venison to the amount of 100 pounds were found disguised as "veal." The confiscated goods were tagged as contraband of law, and promptly sold on the local market, the proceeds being sent to the State warden at Madison.

Deaths Among Deer Hunters.

Thus far I have heard of several deer hunters killed and sixteen wounded in the States of Wisconsin and Michigan this fall. It is not pretended that this list is in the least complete. There are many sportsmen who do not care to go deer hunting in the northern woods of these States during the present reign of terror. The pine woods region of Michigan and Wisconsin in the deer season is a kingdom of fools.

A man from Montrose, Mich., by the name of Chauncey Streeter, went out from his hunting camp and failed to return. His companions hunted for him for over a week, and at last he was discovered, wounded, in a logging camp some miles away, where he was being cared for. He had been picked up in the woods, shot through the thigh by some unknown party.

Big Deer Story.

Mr. Sam Ryan, of Appleton, Wis., hands me the following story from the Merrill Advocate:

"While out hunting deer one day last week Knut Severson, of 1404 East Main street, ran on to five bucks engaged in mortal combat. Mr. Severson was attracted to the scene by a great commotion, and walked up within easy range of the enraged denizens of the forest. After looking at the battle a short time he took aim and felled one to the ground. The buck had no sooner fallen than another buck picked the dead on his horns and threw him high in the air. Mr. Severson again fired and brought down another one. The rest then discovered the hunter and took to the woods. Mr. Severson says that but for the fact that he was so interested in the furious fight he might have killed the whole bunch."

It is to be regretted that Mr. Severson overlooked his opportunity to kill five deer with interlocked horns. Mr. Ryan says that this account from the North equals the alligator war story which Captain Lowe used to relate down at Fort Myers, Fla.

Quail.

Nothing much is doing in the quail regions of this State, our shooters coming back with reports of very moderate bags. The Michigan season is practically at an end, and I do not hear of anything very startling done by those of our Chicago sportsmen who have gone around the lake. Mr. W. B. Mershon, of Saginaw, reports a trip with six friends into a new partridge country in that State, which panned out pretty well, eight or ten birds per day to the gun regularly. Mr. Mershon also says that a friend of his and two others killed two moose in three days near their sawmill in Canada.

The Saginaw Crowd will go into mourning now, I presume. Harry, the head porter and general utility man who has helped make things comfortable on so many of the Saginaw Crowd's trips, is to leave Saginaw and go to college for a course in mechanical drawing and engineering. He is a good engineer of a car party right now.

The Daily Reporter.

My friend, the daily reporter, still does stunts on field sports. He opines that in wild turkey shooting "one needs a good choke bore, shooting a tightly packed load of nitro powder with BB shot in front of it." I cannot help expressing a mild surprise at this statement, as I believe it has never been customary to load BB shot behind a tightly packed load of nitro powder. "That shot must be driven with mighty force," says the daily reporter, "to penetrate the lordly escutcheon of burnished feathers that shines on the wild turkey's breast." I see no reason why talent like this should not find ready employment in the natural history department of a traveling circus. An escutcheon of burnished feathers is not without charm.

Quail in Minnesota.

I have heard a great deal for several years about the abundance of Bob White quail in the State of Minnesota, and, as stated last week, was able to have a taste of the Minnesota quail shooting in company with Mr. Sam F. Fullerton, the State game warden, and Mr. Frank Waterous, of the Waterous Engine Works, of St. Paul. We went out to Norwood, and had in all three days of good, keen sport, being blessed with the first sunshine which had been seen in that country for a long time.

This sport of quail shooting in Minnesota is something worth a little description. I was told that the quail belt extends nearly 70 miles north of where we were, that is to say, about that distance north of St. Paul. There is a big belt of hardwood timber which extends east and west, partly across the State of Minnesota, lying between the prairie country and the pine country. All this country where we shot was once very heavily timbered, and was noted as a splendid range for deer. To-day you would hardly know that this region was once heavily forested. For some thirty or forty years it has been farmed by a thrifty class, mostly composed of German immigrants. The soil is a deep, black loam, exactly like that of the prairie State of Iowa. Here and there a swamp or marsh runs through a section, but for the most part the ground is high and rolling. The crops are wheat and corn, and these thrifty farmers farm so close that they hardly leave cover enough for a quail. That is to say, that would be the offhand dictum of the man accustomed to find these birds in the denser vegetation of our lower country of Illinois and of the South. In the old days out in Iowa, where I spent my boyhood, these fields of corn and wheat were vast in extent, and no one ever thought of cutting or stacking his corn in the fall. The "shucking" was done in the field and the stalks were left standing or lying, as the case might be. With these Minnesota farmers the reverse is the case. They cut and shock all their corn and get the stubble grounds plowed clean early in the fall season. The infrequent groves are for the most part cleared of underbrush, and very little more than a carpet of leaves is left for cover to the quail, which invariably go to the timber when flushed on a bevy rise. When I first saw this region I was satisfied that it was not a good quail country, because it did not resemble other quail countries I had known. But the proof of the pudding is in the eating. Mr. Fullerton told me that he had on one day put up thirty bevies of quail in this same country. We ourselves on one

day started ten bevies, and a great many shooters have gone out there and had no difficulty in making the daily limit of 25 birds. We confidently expected to do as much ourselves. The truth is, perhaps, that we were in there a little late in the game. On our first day's drive, without any local guide and not knowing the country in the least, we only put up a few bevies. The first of these we got up in the first hundred yards of our hunting. They rose high and strong and seemed to light on a patch of brush a short distance ahead. Yet, try as we might, we found only one straggler, and could not stop him. It seemed impossible that they could have gone across the railroad track to a distant grove which we saw, yet such proved to be the case. The birds undoubtedly started to run as soon as they struck the ground and kept going. We put up one or two in the grass as soon as we struck the railroad track, and after hunting around for about an hour where they ought to have been, got a wild flush on the leaves of about half the bevy. These got up wild and scattered every way, flying like bullets, and we could do nothing with them at all after that, picking up only two or three birds after all our skirmishing. We were willing to mark up our appreciation of the sporting qualities of Bob White several degrees before noon of that first day.

We drove on through the country, a clean, prosperous, tidy country, with the mail boxes of the rural delivery staring us in the face at every farm gate, but not getting much encouragement in the quail industry until just about lunch time.

"Now, here's a place," said Mr. Fullerton, pointing to a grassy opening in the middle of an old deadening, "where I am at home. I've been here several times and never failed to get up a good bunch of birds. We'll do some business here."

Sure enough we did. The dogs, being a little eager, flushed a tremendous bevy of birds too far ahead of us to get a shot on the rise. These birds, however, came directly to us and we marked them down close and hard in the grass. To make the story short, we knocked down 17 out of this bevy alone, and, although we lost four in the pick-up, thought that we had done pretty good work. This bevy had probably never been shot at before.

We worked on across the country and at last Mr. Fullerton and Mr. Waterous left me for a trip to a distant cornfield, I waiting near a country graveyard on the somewhat distant chance that our driver, whom we had left a couple of miles away, would be able to keep his appointment and meet us at the church near the graveyard. I did not think the others would find any birds on their trip, and so begged off, but much regretted it later. It was a trifle cold and I found it poor fun walking up and down and reading epitaphs on tombstones. It was still more discomforting when my friends returned, just at dark, carrying five of the biggest quail I have ever seen. They said they needed help on these birds, which they had found at the edge of the wood about a mile away.

It was now dark and the distance into town was about seven miles. As our driver had evidently lost us, we started, with what grace we could summon, to hoof it into town. We negotiated about three miles of mud and darkness and then concluded to charter a farm team. Hardly had we gotten the latter hooked up before our own lost driver came prowling along in the dark. Him we reviled copiously, but presently forgot everything in the warmth and comfort of the little hotel at Norwood.

On the next day we concluded to make the same rounds. Our first day had netted us 19 birds, and on this second day the best we could do was 20. We worked over the same country and located all of our yesterday's bevies and some more beside. All the widely scattered bevies of the day before were found assembled, and at the same places where we first found them. I must say that we all of us shot very indifferently. I used to think that I could shoot quail a little bit sometimes, but lost all manner of conceit of myself on this particular occasion. Some badly loaded shells brought on a shooting headache and I blinked my shots aplenty. Yet, even when one is at his best, he will find that these Minnesota quail ask his best skill. I don't think I ever saw the day when I could kill half of them, day in and day out. They are the largest quail I have ever seen, unless it be those of the Province of Ontario. The dogs could do very little with them when once they struck the leaves, where they seemed to run and disappear as though indeed they left no scent behind them. We passed a delightful day, however, and closed it at dark on a scattered bevy, which would have given us eight or ten birds in all likelihood had we struck them a half hour sooner.

On the third day the best we could do was 18 birds, but we did not find so many bevies as we did on the day previous. We located three bevies each, for the third day, at its regular stamping ground, showing the regularity of habit of this bird. Our shooting on this last day was even more disgraceful than it had been the day before. I felt that I simply had dishonored myself, and even Mr. Fullerton, who is a very steady and reliable shot, indeed, at times, laid himself open to rebuke at the hands of Mr. Waterous and myself, who were depending on him for a bag. Our dogs put up a pretty strong game. Two of them were the property of Mr. Waterous, a fine old setter, Spot, and a hardy, stub-and-twist pointer, by the name of Sport, both very practical meat dogs and perfectly in hand, facts which add so much to the sport of quail shooting, as everyone knows. We had also a beautiful little pointer bitch by the name of Flo, the property of the local banker, Mr. Bradley, a friend of my companions. This latter was reputed to be one of the best chicken dogs in the State and certainly was a god one also on quail. We found that three days' steady work was about all that either men or dogs cared for. Sometimes we thought the dogs looked at us a bit reproachfully when we failed to stop our birds, but once in a while when a quail got up wild on the leaves it was our turn to look reproachfully at the dogs. The fact of the matter is these northern quail represent the survival of the fittest under hard conditions. They are strong enough to stand these severe Minnesota winters, shrewd enough to take care of themselves even on this thin covered country, and strong of wing enough to tax the best kind of shooting skill. I have shot quail pretty much all over the West and South, but I have never seen so hard a quail game put up as they give a fellow out in Minnesota. We only bagged 57 quail in our three days, it being remembered, of course, that part of the time was taken up in driving out of town and prospecting around the country. A well-posted local shooter could probably have done much better, and I presume under ordinary circumstances our same party could have made double the bag out of the chances we had. In good truth, I had chances to kill my limit on two of the days in question, and at that need not have used any greater skill than is common in good, fair quail shooting in the Southern country. I would like to see a lot of these Southern quail shooters go out and get against some of Sam Fullerton's trained birds. Methinks they would come back minus a little conceit and a few birds. Anyhow, that was the way I did.

There are very few ruffed grouse in that part of the country. We only put up two, not getting a shot at either. As for the quail, they there all right, from the line of St. Paul all the way south through the State wherever there is farming country, and it seems to me these birds are there to stay. The winters of Minnesota are by no means so severe as they formerly were, and ever at its worst, the Minnesota winter is not so dangerous as that of Canada or our Middle Western States. The snow, when it comes, is cold and dry, and there is not much rain or sleet to form the fatal crust, which is the worst destroyer of the quail. The food of the birds is abundant, in spite of the bare look of the country, and in spite of the fact that the stubble fields are plowed up early for the sowing of winter wheat. The woods are very open, but there are occasional thickets, or fallen treetops, or ricks of straw or hay, so that in some fashion the hardy little fellows get all the shelter they need. We forgot to weigh any of our quail, but we killed some giants, with strong, thick legs, dense plumage, brilliantly colored, and altogether the handsomest quail I think I ever shot and the sportiest as well. I must congratulate Mr. Fullerton on his so fully making good everything he has said about the quail in Minnesota. Had we only made good with the shooting I might have had quite a story to tell.

Minnesota as a Game State.

I have been growing better and better acquainted with Minnesota for the last few years, and I must say that the more I know of it the more respect I have for it as a game State. I question whether there is in the country a more desirable place of residence for a sportsman than one of the Twin Cities of the State of Minnesota. One can in two hours' ride or less have grand shooting. Norwood is only fifty miles from St. Paul. At Wabash also good quail shooting is reported, and there are many other nearby points. The prairie chicken shooting in Minnesota this fall, as I have had occasion before to testify, is as good as is to be found anywhere. The glory of the Minnesota duck marshes is coming to be all that it ever was. Wild geese, that is to say, honkers, and not white geese, are to be had in some of the northern counties. Ruffed grouse shooting is excellent in different sections. The sharp-tailed grouse shares with the prairie chicken large areas of the State. There is good trout fishing, the best fly-fishing for bass in the world, perhaps the best muscallunge fishing in America, and fishing for wall-eyed pike and big-mouthed bass, such as is not to be equaled in any part of the world. These statements seem broad, but they are made advisedly. The deer supply is such as to allow one easily to get his limit. There are a few elk, probably between 30 and 50 head, still to be found in a remote portion of the State. Of moose, the best posted men tell me there are thousands. In regard to this latter I am very curious, but am satisfied that there are very many moose to be had in the State of Minnesota provided one knows where and how to go. The same can be said of caribou. I don't think there are as many caribou as in New Brunswick, and, of course, not so many as in Nova Scotia, but one stands a very good chance of getting a caribou in a winter hunt in Minnesota. In jack snipe and the different plovers Minnesota can make as good a showing as any of our Western States. The game supply of this State is better than it was ten or fifteen years ago. As I have so often stated, I believe this fact to be full proof of the efficacy of the Minnesota game laws and the rigorous honesty of their enforcement. Here in Chicago we are in the middle of a devastated, desolate, sportless region. It is pleasant once in a while to get out into a corner of the world where one can still get a little touch of the old outdoor American life.

Wild Boars in the Orient.

I see no reason why Japan, the Philippines, the island of Formosa and adjacent territory should not properly be included in the sphere of influence of Chicago and the West. These places are all west of Chicago, and one goes through Chicago to get there. At least, Mr. J. O. Averill, of New York, a tea merchant, with interests in Japan, always goes through Chicago in his trip to Japan. He is this week just back from his season's work in Japan, and paid a pleasant visit as he passed through going home to New York. Mr. Averill says he visited Formosa not long ago and went out into the back country, quite beyond the zone of Japanese military authority. None of the savages of the interior were encountered, however, and everybody brought his head back home with him, which is far more dignified, as well as more comfortable, than having it brought in by another fellow on the end of a sharp stick. These "furtive folk and wild" have still the pleasant custom of head hunting, and one tribe last year took between 500 and 600 heads. They don't mean any harm by it, and are really a simple and charming folk to live with. It is necessary for a man to take a head before he can vote or get married, and this law of the land renders the population at times a trifle hasty, and so careless that death frequently ensues, as a consequence of the otherwise merely perfunctory operation of head-taking. The custom has much to recommend it, politically and socially. It must be grateful and comforting, when two gentlemen are paying addresses to the same damsel, for one to feel free to cut off the other's head. At least, it might seem so before the marriage.

But I was about to speak of sport in Formosa. Mr. Averill says that they had "fish there with much the habits of our trout, though in appearance it more resembles the grayling. Wild boars there are in abundance, and big ones. He saw one boar hunt in which several natives engaged, and in which they got their boar, though hardly according to Hoyle. The animal crossed a bit of open on a hillside, whereupon a native with an ancient musket took a shot at him and crippled him. As it rolled down the hill, another native, armed with a long, sharp sword, fell upon it. Yet others laid hold presently upon its legs, and ere long the boar was finished. Mr. Averill says it was an exciting little hunt, even with the old musket in it.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Vermont Game.

SWANTON, Vt., Nov. 27.—*Editor Forest and Stream:* The game crop here in northwestern Vermont, taken as a whole, has been this season an abundant one, though back on the highlands the cold wet weather during the early summer destroyed most of the young grouse, but down in the lake towns they have been, and are now at the present time unusually plentiful.

We get here both varieties—the true ruffed grouse and the larger Canada gray grouse. The latter bird, from its heavy plumage, looks to be much the largest bird, though actual weight they are but a few ounces the heaviest. We recently killed an old Canada cock bird that weighed one pound and twelve ounces—this was actual weight; the guessed weight was about three pounds.

We had more woodcock here this season than for many past seasons. We can only account for this fact that during their migratory flight southward last season they in some manner escaped the horde of gunners that lay in wait for them. It is not the few that we kill here near their breeding grounds that diminishes their numbers, but it is the number shot along their migratory route and also where they winter in the South, where beside the sportsman and market-shooter, nearly every colored boy has a cheap single-barrel breechloader, which they use on that bird that they have learned "is mighty fine eatin'." In the localities where the frosts in the early summer did not destroy the beechnut crop, gray squirrels are numerous.

Deer are on the increase. One morning recently, just after the open season closed, two bucks and two does were seen in the center of the village of Highgate, Vt. They were in the backyard of our late State's Attorney Steele, and were evidently paying their respects to one who has been active in giving them the full protection that our laws will give to that kind of game. On every occasion possible, State's Attorney D. W. Steele has made it extremely "hot" for violators of the game laws.

Thousands of black duck bred this season here in our marshes. As the flats are overflowed, they have had the best of feeding grounds. So far the flight of migratory duck and wild geese has been light. The next keen cold frost will bring them along. During the early autumn the muskrats in this vicinity began building their houses up high out of and in some cases away from the water. This caused us to predict high water, and this prediction has come true, for the water in the marshes was never, in the memory of the oldest inhabitant, so high as it is at the present time.

Our fox hunters are having fair success, and some good pelts have been taken. Our State legislators have recently passed a bit of "jackass legislation" in placing a bounty of $1.25 on foxes killed during the summer months. This is simply another instance where the farmers do not know their best friends. The fox stands to the farmer's orchard, meadow and pasture lands as the cat does to his granaries; it keeps the mice in check—keeps their numbers down. In western Vermont the fox saves to our farmers thousands of dollars where they kill a single dollar's worth of poultry. The writer has hunted foxes for fully half a century and has yet to see where a fox has killed a turkey, goose or chicken, and many and many a time have we seen full broods of turkeys raised back in the back pastures where foxes were numerous. When they take poultry it is after they have caught off all the mice. The number of mice, called meadow moles, that a fox kills every year, if allowed to live and breed, would with their progeny ruin the farmer's crops. The valuable fur of the fox if killed during the winter months brings a much-needed revenue of foreign money into the State. In face of these facts, which were given them, our Dogberries have put on a bounty for the summer months that will encourage every boy in the country to kill and exterminate this valuable fur-bearing animal when its skin is commercially worthless.

An occasional moose is seen in various parts of the State. So far, the number of buck deer reported killed here during the open season is 405. One of our hybrid lawyer-farmers carried in a bill to the Legislature for something like $400 damages done on his farm by deer. His claim was promptly turned down, as the character of the man was so well known that it helped rather than injured the fast-growing sentiment of full protection for the deer. STANSTEAD.

Game Near Worcester.

WORCESTER, Mass., Nov. 24.—On a shooting trip the other day we killed 24 birds—13 grouse and 11 quail. Pretty good string for one day's hunt within a few miles of the city. GEO. H. BURTIS.

Some Long Island Shooting.

RIVERHEAD, Nov. 26.—The Roanoke Recreation Club have this year shot and killed 200 quail, 150 rabbits and 25 partridges, in addition two foxes, which was the result of the first day's hunt for foxes. Rabbits have been very plentiful this year. One day members of this club killed eleven rabbits in a two hours' hunt at the sound cliffs. Old hunters say that not in many years have rabbits and foxes been so plentiful as they are this year.

MANOR, Long Island.—Wm. Jerger, of New York; Ben. Hallock, of Centre Moriches; Ben. Shaw, of Valley Stream, and Geo. W. Raynor, of Manor, had a very successful day in shooting Thursday, Nov. 20, having killed fifty quail and six rabbits. G. S.

EAST MORICHES, Nov. 26.—Duck shooting has been fairly good in this section recently, and yesterday was one of the best day's shooting ever known here, taking into consideration the kind of birds shot—redheads—of which forty-four were killed, also some broadbills, by Scott E. Raynor, Frank Albin, George W. Palmer and Edgar M. Benjamin, all of East Moriches. The birds were shot in Hart's Cove, within one-half mile of the public landing at East Moriches. Old gunners say redhead shooting is now the best in their lifetime.

W. C. GERARD.

AQUEBOGUE, Nov. 26.—Mr. A. V. Fraser came out here hunting for quail, and in two successive days killed thirty-eight quail and one partridge. These were all shot on the grounds of the Aquebogue Gunning Club, and within one-half mile of the station.

C. L. HALLOCK.

RIVERHEAD, Nov. 28.—Game appears to be plentiful in this section this season. Eugene Beitter, of Brooklyn, recently made a gunning trip to Aquebogue. Mr. Beitter is a thorough sportsman, but he acknowledges that he never had so much sport as he did on Tuesday of this week, when he and his friend, James M. Magee, of Aquebogue, went out on Peconic Bay with Capt. Herbert Downs ducking. The party killed and brought home twenty-three ducks, including a number of broadbills and some black duck. As a result of three days' gunning trip, Mr. Beitter carried home twenty-three ducks, twenty-two quail, ten rabbits and one partridge, all of which game was killed on unleased lands.

One day recently Capt. Downs and party killed eighty-one ducks off Mattituck with a battery.

Nathan T. Corwin and party killed a fox on Thanksgiving Day.

BAYPORT, L. I., Nov. 30.—The past week has shown considerable improvement in gunning, if the number of birds counts for anything. Among the number from here who have had good bags was Mr. S. G. Painter and party, of New York, who on Thanksgiving Day got forty-five broadbills with Guide Will Brown. Mr. G. Hill, with Guide Le Roy Still, got twenty. Mr. Painter and party made a start out on Friday at 4:30 A. M., but the wind was blowing so hard it was impossible to put out a battery, and they returned to the city very well satisfied with their one day outing.

Saturday was a nice day for ducking. Will Brown in a single battery got twenty-three broadbills. G. Still got eight quail. The ducks still keep rather wild, but I think that if we had three or four days of storm, when they could be relieved from their daily bombardment, which has been going on now for six weeks, there would be some appalling bags made. One gentleman who had shot ducks in all parts of the world, said to me the other day he never saw so many ducks at one time before, and the feeding grounds are in excellent shape.

HENRY STOKES.

The Cuvier Club.

THE Cuvier Club, of Cincinnati, held the annual banquet on Nov. 25 in the club rooms, which had been handsomely decorated for the occasion. President Alexander Starbuck welcomed the members and guests, of whom there was a goodly company, for the Cuvier membership now comprises 500. The menu was an artistical gustatorial non disputandum triumph of Chef E. P. Boblett, of Columbus, whom the Cuviers regard with a certain degree of awe for his skill and achievements. Mr. Boblett has a secret method of boning fish after they are baked and putting them together again without a break in their symmetry, and he apologized for the delightful deception he had played on the old hunters and Nimrods, but his apology was not accepted, and he was voted a gold medal. The game features of the elaborate menu included: Saddle of blacktail deer, venison steaks, venison chops, Kentucky sauce, golden plover with entrails on toast, teal duck, snipe, duck (wood pintail), mallards, guava jelly, antelope potpie with fresh mushrooms, rail birds, quail broiled on toast or stuffed with oysters, hominy fritters, wild turkeys a la Montargis, cranberry sauce, sherbet, creme de menthe, cold pates of black bear, pates of game, St. Hubert aux pistaches.

Fox Hunting on Long Island.

RIVERHEAD, Long Island, Nov. 27.—Fox hunting is now great sport in the vicinity of Riverhead. The first party of fox hunters went out on Tuesday of this week, and in a half day's hunt succeeded in killing two splendid specimens of the golden fox. In the party were Nathan T. Corwin, Fred. Corwin and Charles Cheshire and the foxes were hunted on what is known as the Quogue Plains, south of the village of Riverhead. This vast field of waste land affords splendid territory for fox hunting. Fox hunting is exciting sport, and a hunt with an experienced Long Island fox hunter is indeed a treat. Foxes are reported to be plentiful this season.

VULPUS.

They Always Did It.

Editor Forest and Stream:

Speaking of the frequent casualties to hunters at the hands of each other, I find that Thoreau, in mentioning the early celebrities of Litchfield, on the Merrimac, says, "James Rogers was from Ireland, and father to Major Robert Rogers. He was shot in the woods, being mistaken for a bear." So they seem to have been always at it. In this morning's paper I see mention of two more casualties of the kind. There is plainly nothing for it but for every hunter that goes to the woods to wear a bell.

T. J. CHAPMAN.

INGRAM, Pa.

Dead Shots in the Maine Woods.

Editor Forest and Stream:

The art of gunnery as practiced in the Maine woods, according to the stories told of men being shot there, so frequently when when mistaken for deer, shows that our young bushwhackers are dead shots. They never have buck ague. They never miss what they aim at. Had the man who was shot been a deer he would have dropped just the same, presumably. Now, these fellows ought to train for the army as sharpshooters. They would be a mortal terror as soldiers. No human enemy would dare to face them. C. H.

How to Cook a Coot.

OSSINING, N. Y.—I noticed in an article from Washington State that mud hens were too strong for Mr. Baxter. I have had no experience with the mud hens of the far West, but those from this locality, if fixed in the following manner, are plenty good, and excelled only by a broiled woodcock or possibly the broiled breast of a young fly-up-the-creek or bittern.

Remove the skin, slice off the breast, cut slits in it, and stick in the slits thin slices of fat salt pork. Broil over a quick fire, and see if you ever throw away any more coots.

C. G. BLANDFORD.

In Western Massachusetts.

PLAINFIELD, Hampshire County, Nov. 17.—The last days of October and the opening days of November have been beautiful; no house fire except in kitchen, and all windows open; in fact, it is more like summer than our summer was. Leaves are all off the trees. A lot of game has been killed this fall, and one hears the reports of guns at all hours and on all days, on Sunday as much as any other day. Partridges and hawks are numerous, both very tame. Rabbits are trying to get out of the country. One was seen reading the fingerboard of the cross roads the other day. F. W. G.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

Rifle Wrinkles.

IT IS sometmies desirable to use for hunting a rifle barrel which has fitted in near the muzzle the base of a wind gauge target sight. A good hunting sight may be whittled out of a celluloid collar button in such shape that it will fit in the same base and slide in and out readily. The wide bottom portion of the button should be trimmed off at two opposite points, narrowing it to the required width, and the straight edges thus formed should be beveled to fit under the beveled faces of the sight base. The button is then slid into the base until it comes against the ring of metal, which is made for the screw of the wind gauge sight. That end of the button must be cut off enough to bring the bead—which is made from the small, upright part—in line for correct aiming. This is arrived at by careful rest shooting at a target, with a file at hand for the final touches at the inner end of the celluloid. This is the delicate part of the operation, as the least bit too much of filing here will let the bead go past the desired line of aim. This sight, if made just right, fits snugly enough to keep its place, but may be fastened, if necessary, by a little wedge, like the end of a wooden toothpick, inserted under the outer end.

Some of the methods of cleaning rifle shells are absurdly laborious. I find nothing necessary but to soak them in hot water, and then shake them up thoroughly in it. Under this treatment, they turn blackish, but that does no practical harm. They are not dirty, corroded or weakened by this discoloration. A handy device for drying them may be made from a cigar box. Remove the cover, and cut out in the bottom of the box slits as wide as the shell is at the point where it joins the head. Then, with the box bottom-side up, drop the rinsed shells into the slits, where they will hang by their heads, and set the box on the stove, grate or radiator.

The box thus tinkered also serves me conveniently in connection with lubricating bullets, which is the worst part of bullet-making unless one has some suitable instrument for the purpose. The Ideal and similar lubricating tools are rather expensive, and I have managed to get along with a home-made substitute. I lubricate the bullets after loading, having left them projecting from the shell near their whole length, which is conducive to accurate shooting. The loading of the clean bullet is a neat and pleasant job. I use tallow for the lubricant, and it is a good one, but so nasty on the fingers that I like to apply it without touching it. For this purpose a tool may be made as follows:

Take a bit of planed board two or three inches square and an inch thick or more. In one face of it, with a fine saw, make two cuts half an inch deep—more or less, according to the bullet used—crossing at right angles in the center of the block. At this point bore down to the same depth with an inch auger. In the saw cuts fasten four thin pieces of wood—veneer, for instance—projecting equal distances into the auger hole. Their inner ends must be so near together and trimmed to such a curve, that when a loaded shell is stood up between them the bullet touches each of these ends all the way down.

The tallow having been melted in a shallow tin dish and placed on the cooler part of the stove, take each loaded shell by the head, dip the bullet in the grease, and then hand the cartridge through the bottom of the cigar box, as above directed for drying shells. Set the box aside and the tallow will soon stiffen enough for the rest of the process. It should not get so cold as to crack easily. Taking each cartridge again by the head, insert the bullet in the hole in the block, and by a turn or two of it the superfluous tallow will be removed by the ends of the veneer slips. A similar turn of the nose of the bullet in a bit of rag will leave that part still cleaner if desired, with plenty of lubricant remaining on the bearing part.

BRISTOL HILL.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

A Pearl River Camp.—VII.

(Continued from page 433)

AFTER an early breakfast next morning, we began preparations for our trip to the tree bridge at the mouth of the lake, for a try at the river fish. Our light lines were removed and replaced by heavy cotton ones, about as coarse as chalk line, fitted out with a buckshot, called a blue whistler, and a strong hook. No floats were to be used, as we intended to do only bottom fishing, mostly for channel cat, which is an excellent table fish when taken in running water, if not too large, the large ones being somewhat coarse.

The plebian angleworm we knew to be the best bait, but how to get them was a question that puzzled us. No spade, no hoe, no nice damp spot in the yard or garden in which we knew them to be, whether near the surface or deep down, it was all too unusual and vague to be encouraging.

Will solved the first part of the difficulty by making a very serviceable fork—for the soft ground we had to work—by cutting a dogwood limb that forked, and pointing the ends with our hatchet.

Then by moving logs and turning over about half an acre of ground, we succeeded in collecting a fairly good supply of bait, which was stored in a broken jar, that had come out with us filled with an article of strawberry jam, that would win county fair blue ribbons against all comers, only to be eaten by hogs.

> "How had the mighty fallen!
> Immortal Cæsar dead and turned to clay,
> Might stop a hole to keep the wind away."

Crossing the lake in the boat, we hurried down to the point of destination, arriving there just as the sun was beginning to show through the trees.

It was a perfect morning, calm and bright, and we found the river flowing by without a ripple on its clear surface. The conditions were all favorable to success, and our enthusiasm was great and expectations high.

Walking out on the tree, we seated ourselves in a row over the water on the smooth trunk, which afforded a comfortable and convenient location for fishing the river. As fast as we could bait up we sent our respective lines out into the water, where they landed with a musical "plunk" and sank down until they hung almost perpendicular from the end of the poles, showing that there was good depth of water.

It was not what a salmon killer or expert fly-caster would have thought the thing, but it suited four boys as though made to order; and we swung our feet, chatted in low tones, and were altogether happy.

"I've got a bite," said Jim, after a few moments' waiting.

"Big one?" we chorused.

"Yes; see him jerk."

And we could see the line show considerable disturbance.

"Give him time," said Walter; "let him run before you pull."

Waiting until the line straightened out in a strong, steady pull—which was what we called running with it—Jim jerked. He hooked his fish, and it was a good one, a channel cat that weighed about two or three pounds. Dragging it upon the log, amid excited suggestions and directions from all hands, he gripped it firmly back of the dangerous fins and made for the nearest bank, climbing over Will and knocking off that gentleman's hat in his haste.

While Jim secured his fish, the rest of us cast for the hat that had gone overboard, and finally succeeded in catching a hook in it before it had floated out of reach.

Walter had the next bite, and caught another catfish about as large as the first one. I scored next, and then Jim was lucky again. We each caught several fish before Will had a bite, but he broke the record when he did begin, as his first fish was a cat that we felt sure would weigh from eight to ten pounds, as it was fully two and one-half feet long. We all took a hand in landing the big fish, and it was a very exciting event. After several narrow escapes from pitching off the log we retreated to the bank, dragging the pole, and fought it out there.

The fish was well hooked and the tackle strong, so we only had to wear it out by dragging around in the water and then haul it out on the bank. It was a glorious fish, and filled us with satisfied pride when its capture was accomplished.

We held an informal celebration in honor of the lucky event, and danced around our prize like a lot of savages around a well-fed missionary.

There was very little of the successful sportsman enthusiasm in our function; it was the thought of once more having all we could possibly hold to eat that caused our rejoicing.

Resuming fishing, we soon added variety to our string by catching some fairly large perch and drum.

As the sun mounted well up, it grew unpleasantly warm, and as we had a large string of fish, and the bait was giving out, we discussed the advisability of getting

back to camp so as to prepare an early and bountiful dinner. The suggestion was made that we ought to have some of the old darky's good corn bread to eat with our big fish, and this met with favor. Careful search brought to light sufficient funds to buy the dinner loaf on the same terms as before, and we proceeded to cast lots, to see which two should go after bread, and which return to camp to build the fire and clean fish. The lot fell to Jim and me to go after the bread, and I was not sorry to get a pleasant tramp in the woods instead of doing a stunt cleaning fish. Jim had stopped fishing some time before, owing to the fact that he had caught a large snapping turtle, which the combined efforts of the entire party failed to persuade to part with the hook.

"Let him keep it, if he wants it that bad," said Jim, resignedly cutting the line at the hook, after we had exhausted ourselves in trying to get it out.

The others now began to wind up their lines, preparatory to leaving, but I was very anxious to discover the identity of a fish that had bitten at my hook several times, and so continued fishing. It was a peculiar bite, unlike that of any fish I knew, consisting of a series of short, snappy jerks, and a long gentle pull. Three or four times I jerked, thinking I had the fish, but failed to hook anything. Finally, waiting a little longer, I gave a hard jerk and the hook struck. I hoped it was something large, and the first pull looked as though I had my wish. The tough spring pole bent almost double, as I laid back with all my strength, but no fish showed.

Easing up a little, the line was drawn smartly back, and greatly excited I again pulled with all my strength. I could plainly feel a quivering and jerking, but could not gain any ground in the tug of war contest, although doing my very best.

The other boys were now crowding up on either side encouraging me to "hold on" and "pull hard," both of which I was doing.

Again I laid back with all my strength, and this time won. Out of the water and straight at me, wriggling and threshing, came a large eel, the first one I had ever seen.

It did not require the startled cry of "Snake!" raised by one of my companion, to mislead me. It never occurred to me that it could be anything else. I had been pulling straight in, and when the eel's hold broke and it flew out of the water, it was directly toward me.

There was no time to run, or even to get to my feet. There was but one thing to do, and I did it. Rather than have the snake in my lap, I took to the water, pitching over backward off the log.

Will, under the impression that I had lost my balance and was falling in, tried to rescue me, and very narrowly escaped going in too; his hold on my foot breaking just in time to permit of his saving himself by a quick grab.

The fifteen-foot fall and deep water had few terrors for me, but I did hope that the boys would intercept the snake, and not allow it to follow.

Coming to the surface, after a long dive, I saw that they had my pole and were dragging the snake, as I yet thought it, to the nearest bank. Turning, I swam over and landed on the other side. Crossing back on the tree, I found the boys gathered around the eel, which Walter had identified. They condoled with me on my accident, as they thought it, and I told them no better.

We were all greatly excited over the novel catch, but rather at a loss to know what to do with it.

Eat it, of course, we said, but each one firmly determined that he would not undertake to prepare it for cooking. After a little *finesse* it developed that not one of us would even take it off the hook, and the line was finally cut, leaving about a foot to carry it by.

As it was necessary for me to go to camp for dry clothes, Walter volunteered to take my place in going after bread with Jim, while Will and I went to camp with the fish.

As they were starting it occurred to Walter that perhaps our negro friend might know more about eels than we, and might possibly consider them a delicacy, so suggested that he carry it to them, as a present. This was agreeable to all, and we separated, Walter and Jim making for the cabin in the woods, carrying the eel and all our available coin, while Will and I returned to camp with the heavy load of fish and the fishing tackle.

Reaching camp, I changed to dry clothes, and Will having made up the fire, we set to work cleaning the fish.

Practice had made us so expert in this business that we soon had the entire catch cleaned up and put away.

Arranging all things in readiness for getting dinner without delay, we started to paddle across to where the boys would strike the lake on their return to meet and ferry them over.

I had carried my gun, thinking we might have to wait some time, and something might offer to shoot at. The other boys had not arrived at the lake when we started over, and we idled along enjoying the beauties of the view up and down the long stretch of water.

We were seated in the bow and stern of the boat, and as we drifted along well out from shore, I noticed a large water bird flying toward us from down the lake. Will had turned his back to me and was looking in that direction, but had not noticed the bird.

It looked like it belonged to the crane family, all neck, legs and wings, but had it been a wild goose, in season and condition, I could not have been more excited and anxious to kill it.

It was a big, strange bird, and I a boy, with sporting blood. Like the London Cockney and his friend:

"Eh, Bill, 'ere a bloomin' stranger."

"'E is you soi? 'Eave a stone 'at 'im."

Cocking my gun carefully, so that Will would not hear and go to moving about, shaking the boat, I began to try to cover the approaching bird, intending to fire when it got near enough.

It was flying slowly and steadily, but I could not get satisfactory aim at it.

Nearer it came—flying straight toward us—and higher and higher went the muzzle of my gun, as I jerked it around in my excitement, until the bird seemed about to pass over the boat, when, in desperation, I fired at a moment when my gun happened to be pointed right, and down it came in a confused tangle of legs and neck. Will whirled around at the report of the gun, but before he could begin his inquiry, the big bird crashed down, striking him a glancing blow on the side of the head that almost knocked him out of the boat.

Badly frightened, he snatched up a paddle and stood on the defensive until he saw that the bird was dead. He then invited me most cordially, in very forcible language, to lay down my gun and come to his end of the boat and let him knock a little sense into my head, frankly assuring me that a fellow who would shoot a big bird like that to fall on any one's head, did not have as much sense as a string of dead fish.

It took me some time to convince him that I had shot the bird flying and could not know where it would fall, but peace was about restored when the other boys hailed us, having arrived with the bread. After all had duly admired the bird, and speculated upon its usefulness as an addition to our larder, Walter and Jim gave an account of their visit to our colored friends.

They had been as kind as could be, and seemed glad to supply the desired bread. They were delighted with the eel, and said it was the best of eating, and that the skin would certainly cure "de misry an' rheumatiz."

The boys had a nice present in return for the eel, a dozen fresh eggs for our breakfast, which filled us all with delightful anticipation.

Our dinner that day was one of the few meals we had enjoyed, when every one actually had as much as he could hold. "Thank goodness we don't have to lick our plates to-day," said Jim.

As the next day would be Saturday and mark the close of our camping out, we concluded to devote the afternoon to a trip which had been discussed several times, but not attempted owing to lack of time to devote to it.

This was a voyage in our boat down the lake to the river, then by the river to the upper end of the lake, then on the lake to our landing, making the entire circuit.

We set forth after dinner, carrying both guns, feeling sure that we would see some small game and perhaps something in the way of big game, in the new country about to be explored.

The plan decided upon was that two should sit forward with the guns ready to shoot any game sighted, while the other two paddled the boat, and whenever a fellow got a shot he was then to exchange places with one of the paddlers, thus giving all a share of the work and sport.

Jim and I drew first turn at the guns, and taking positions well forward—with Walter and Will at the paddles—we started off down the lake, paddling along quietly as possible close in to the bank under the shade of the overhanging trees. Jim was very excitable and was soon wrought up to a high pitch by a commotion in a hickory tree that grew near the bank, caused by some squirrels that were disturbed in their afternoon lunch.

We tried hard to get a fair shot at one of them, but all escaped.

On down the lake we went, Jim and I almost breathless with excitement, starting at every rustle on the bank, or splash of fish in the water. In perfect silence we rounded a point and ran almost on a big blue crane standing in the water's edge.

In a moment all was confusion, Jim and I springing to our feet and the other boys hissing out directions in excited whispers.

Before I could raise my gun to shoot, Jim ran to the bow of the boat, and leaning forward toward the big bird flying slowly away, fired both barrels of the gun—which he had not raised to his shoulder—down into the water, just missing the side of the boat, then turning around he commanded, begged and implored us to pull hard as the big bird was hit, declaring that he saw the feathers fly in a cloud.

He was promptly disarmed and relegated to the galleys. A squirrel was the next game sighted, which, when shot, fell in the water. We waited patiently for it to come to the surface, not knowing that it was one of the few animals that did not float in water when killed, until our patience was exhausted; then concluding that it would not be in a condition to do us any good by the time it floated, we left it.

Two more squirrels were treed a little further on, which were killed so as to fall on the bank.

The most interesting event of the trip was seeing a water turkey, which we approached quite near, in slipping around a point. None of us knew then what it was, but our surprise was great to see it dive from a limb and go under the water, scarcely causing a perceptible ripple.

We stopped the boat and watched for it to come to the surface until we finally concluded that it had wittingly or unwittingly drowned itself.

This theory was strengthened in our minds by seeing what we believed to be a small twig shaking as though disturbed at its lower end, which was under the water, and we concluded that the unfortunate bird had dived and become fast in some sunken drift.

We learned later that the supposed moving twig was in reality the bill of that strange, snaky-looking bird called the water turkey. Near the lower end of the lake the boat passed under an overhanging limb that extended out about on a level with our heads. Walter and I were forward, with the guns, and as we reached the obstruction, and leaned forward to pass under it, both discovered a large moccasin snake lying directly over where the boat would pass. It was too late to change the course of the boat, or shoot the snake. Knowing the habits of these snakes, I felt sure that it would drop from the limb as soon as disturbed, and concluded to be out of line, if possible. Dropping my gun, I dived under the limb and scrambled to the front end of the boat. Disturbed by the boat, or my sudden movement, the snake rolled off, falling behind and directly in front of Jim, who sat in the seat just behind us. Jim had leaned forward so as to escape the limb, which caused the snake to narrowly miss falling on his head, and land immediately under his face.

Springing to his feet, he found himself swept by the motion of the boat against the limb which the snake had vacated, and with the idea of "any port in a storm," immediately sprang up on it. Will, seeing the snake, and not caring to try conclusions with it in such close quarters, with rare presence of mind followed Jim's example and sprang into the tree.

The limb, not strong enough to bear their weight, let them both down in the water, but they were better off than we were. One paddle had gone overboard, and the snake was between us and the other one.

It seemed to feel that it was not welcome, and made two or three unsuccessful efforts to go over the side, while Walter and I crowded into the bow of the boat, as far away as possible.

Walter had held on to his gun, and I urged him to shoot the snake, but fortunately he had the good sense to refrain from doing so, knowing that such a course would wreck and sink the boat. Taking a wiser and safer course, he drew out the ramrod of the big gun, which was almost as thick as an ordinary walking stick, and armed with this weapon attacked the snake.

Before he could deal a killing blow, the enemy concluded that it could climb the side of the boat, and doing so disappeared under the water.

Jim and Will were only wet to their waists, and we were all glad that the adventure ended as well as it did, for as the moccasin snake was known to be both vicious and venomous, our danger had been real. Re-embarking our two companions, we resumed the voyage. Near the mouth of the lake we treed two more squirrels, both of which were bagged, and on the trip up the river we killed two small ducks. The ducks we knew as whistlers, or fish ducks, and were by no means highly prized by local epicures, but in spite of this, and the fact that it was out of season, we considered them great prizes.

Reaching the upper entrance to the lake, we stopped for a short rest, beaching the boat on a sandy point, and once more saw the big blue crane, or another of the same species. It was discovered when some distance off flying lazily up stream toward us. Walter and Will had the guns, and we all crouched down in the bottom of the boat in great excitement. Slowly the great bird flew, following the stream, until almost abreast of our boat, when the two gunners sprang up and discharged both barrels of their guns at it, without so much as ruffling a feather.

With the exception of Jim, who yet felt the humiliation of his failure to bag it, we were dreadfully disappointed at not adding so great a prize to our bag.

The shooters each made long and detailed explanations of the remarkable escape of the bird, but as their hands shook so that they could scarcely reload the guns, it was very evident that intense excitement was the real trouble with their shooting.

As we approached the boat landing we were hailed from the opposite side by the boy's cousin, who had come back to spend the last night with us. He was very welcome, especially when we found that he had brought two loaves of bread and a large package of cakes. It was a positive orgie in camp that night, as we cooked nearly everything we had, and ate to the point of delightful discomfort. Fish, squirrels, ducks, eggs, bread and cake at one meal seemed verging on extravagance after the season of dearth of variety through which we had passed.

An honest effort was made to work up some feeling of sadness appropriate to the occasion of the last night in camp, but though the talk was all right along the line of how awful hard it was to give up the freedom and delights of camp life and return to the monotony and restrictions of civilization, there was an undercurrent of hilarity among the mourners that argued somewhat against their sincerity. In spite of every effort, our conversation would drift around to home, and we would begin to plan pleasures incident to the return with eager enthusiasm. Especially did our discourses grow eloquent when the discussion turned to the subject of the one week ago despised home cooking.

"And pie!" said Will. "Why, fellows, it seems years since I tasted pie. I'll bet I could eat three whole ones by myself."

"Three?" said Jim. "I could eat a dozen; and as for boiled custard, and rice pudding, I could eat—as our little cowboy used to say—I could eat a slop bucket full."

It was late bed time before we could manage to cease discussing the sad prospect of returning home, and we were up and at it early the next morning.

There was not much on hand for breakfast, which was soon disposed of, and then—although we had given our teamster express instructions not to return for us until late Saturday afternoon—we hastily packed up everything in readiness to start home.

Fishing, a boat ride, and a short hunt were, in turn, proposed to pass the time until the wagon came, but none of us seemed inclined for these pleasures, although entirely out of provisions. Our visitor had started for home early in the morning, and so we had no element of variety to help the time pass.

From sunrise until well past noon we sat around our dismantled camp, straining our ears for the first sound of the vehicle that was coming to tear us away from all the delights of camp life, and drag us back to hated conventionalities, and were beginning to feel, and show, some signs of very realistic impatience when it finally hove in sight.

We certainly were good actors to hide our sorrow so well, and welcome the good old colored individual with such apparent shouts of welcome. But when he handed out a basket of dainties sent us by loved ones at home, and requested us to "Des pleas' eat a little bite while I feeds de hosses," we loved him, honestly and sincerely.

The return trip was as pleasant as such a sorrowful journey could be to four impatient boys, and if we were reluctant to return, and did constantly harp on the perfect delight of camp life, our welcome was cordial. We were the envy of all the other boys, and our narratives were eagerly listened to whenever we would tell of our week of glorious freedom, and especially when we would dwell on the fact that we literally lived all the time on fish and game. There was one very unpleasant incident of our homecoming, which had to do with the hog mentioned heretofore. It seemed that the hog owner had read the signs better than we thought and instead of scaring us to death, had considerately visited our parents and allowed them to settle for the hog. Our respective paternal ancestors settled with us, imposing terms, each as seemed him best, and the days of our first camp were "Gone, alas! like our youth—too soon."

Take inventory of the good things in this issue of FOREST AND STREAM. *Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?*

Camping on Old Capon.

THE Rod and Reel Club of this city, which has heretofore camped on the Shenandoah River, changed fishing grounds this year and pitched their tents on the banks of old Capon. The Shenandoah is all right when it is clear, but the trouble is you so seldom strike it in that condition.

We left old Winchester town about 2 o'clock Monday morning in a hay wagon. None of us will ever forget the ride, or the walk, as some of the fellows called it. There were eight of us in the party, and after we had packed our provisions, tents, etc., on the wagon, there was little room for anything else; so we had to take seats around on the boxes, on the minnow barrel and any old place where we could get a hold. After we passed Whitacre the road was something fierce, and every now and then you would see some one slide off and try it afoot. But we finally got to Break Neck spring, and by 6 o'clock had the camp in order and some fish for supper, too, having detailed several of the camp to try their luck, while the rest put up the tents. We were all tired and worn out when we sat down to supper, but I tell you everything tasted good. Judge Hodgson can't be beat at making coffee and frying fish, and we all owe him a debt of gratitude for acting in this capacity while on Capon.

After supper the judge proposed a game of pitch, and Claude Ryon, the youngest and gayest soul of the party, soon had the cards out of one of the boxes and soon two games were going. At 10 o'clock Quartermaster Yeakley made the announcement that it was bed time, and we were all soon sleeping on our beds of straw at the foot of the mountains along old Capon, far from the madding crowd—with naught to disturb our slumbers save the musical murmuring of the water as it gently glided past us on its never-ceasing journey.

The water was a little too muddy for bass fishing the first two or three days, but it soon cleared up, and then we got down to work. For some distance, both above and below us, there were riffles of the finest kind, here and there deep pockets and eddies, just the places to run across old Mr. Bass.

It was a sight to do one good to see the venerable Judge Hodgson wading waist-deep in the tumbling water, gracefully casting here and there into the pools and

THE CAMP ON OLD CAPON.

around the rocks, and to hear the sweet music of his reel as the fish goes out. The judge calls a halt and gets down to work, and the game fellow at the other end throws himself clear out of the water in his efforts to get away; but the judge has him fast and he is soon in that veteran angler's fish basket. Most of our party were fond of fishing, and the little dam we had made just below Break Neck was nearly always full of fish, and, after being cleaned, would keep there as well as if in cold storage.

Looking down the river most any morning you could see Cap Clowe balancing himself upon a rock in the riffles, every now and then throwing into a different place, and later on, if you were in no hurry and out for a morning walk, you could see him suddenly raise his rod and become deeply interested in something cutting through the water, and there see a shining object flash in the sunlight and later slide down his fish string. "Cap" is an ardent follower of my friend Walton, and is never happier than when looking for fish in the riffles.

Charley Brown, you might say, was one of the most enthusiastic anglers of the party. Possessing plenty of patience and good staying qualities when he knew the fish were there (and he generally knew where to find them), he always had a good string to his credit when the evening shadows became too thick for him to pursue his favorite pastime any longer. He and my fisherman friend, Billy Flemister, generally went together and always brought in their share of the fish.

Dick Hodgson and myself (my old fisherman companion) could every morning be seen strolling down to some favorite resort below Auntie Hatfield's, and not until the dusk of evening had fallen and the faint call of Quartermaster Yeakley was heard in the distance, would we turn our faces toward camp. Mr. Yeakley always says he doesn't care to fish much, but one day, while coming up Water Street he saw something cutting through the water, and jerking a line some of the boys had left tied to the bank. He couldn't resist the temptation to see what it was, so he got hold of the line and commenced to pull it in, but the thing at the other end was game, and before that gentleman got through with him he acknowledged to himself that there was sport in fishing after all.

A trip was made to Cawdy's Castle several days before we left Capon. From the top of this immense pile of rock, rising out of the mountain, can be had one of the most magnificent views in that section of the country. You can look far, far away to other lands that seem fairer than this—where the fleecy clouds bend down to kiss the hazy slopes of other mountains—but after looking around you closely you will come to the conclusion that there could hardly be lands fairer than this along old Capon. It is about 700 feet from the bed of the river to the top of the castle, and the climb up is both picturesque and dangerous. Just before you reach the top you have to climb up a little ladder about 10 feet long, and you don't want to look down, either, for if you do you might lose your nerve, and then it would be all up with you. I will have to confess that I was glad when I got off that ladder on to the top of the big rock and gladder still when I got down from there altogether. Cap Clove, Billy Flemister and Claude Ryon raced around over the top of the castle as if they were trying to beat each other to some favorite fishing place below Auntie Hatfield's.

Cawdy's Castle is visited every year by a great many people. Just before you reach the top there is a room-like apartment in the rock about 6x6 feet, and as you approach the entrance you make a short turn. The path right here is very narrow, one side of which slopes down almost perpendicular. Cawdy was an Indian scout, and whenever pressed too hard he would go to this little cave, and when his Indian pursuers would round the curve at his retreat he would push them over the path down into the depths below.

Many good times we had at camp at night playing cards. Judge Hodgson is very fond of the game, and we boys could not cheat him, either. The night before we left we had a farewell game, and the judge and Cap Clowe, and Billy Flemister and Claude Ryon were at one table. Suddenly Claude Ryon made the startling announcement that he and his partner had made high, low, Jack and the game. The judge looked up and said, "We'll just count you for game." At the end of the count Claude made the discovery that he had counted two too many, and then some one yelled from the other table: "It's all in the count, judge."

We were all sorry when the time came to leave old Capon, for we had all grown to love the picturesque surroundings of Break Neck and the walk down "Water Street." You could notice the judge, just before leaving, looking longingly down over the sparkling riffles below us, when his whole soul was at the moment wishing, no doubt, for just one more wade in the tumbling waters. His reverie was interrupted by Driver McFarland calling out "All aboard," and we were soon leaving Break Neck far behind us.

WINCHESTER, Va.

Fish and Fishing.

More About Trout Tickling.

A COUPLE of letters which have reached me within the last few days, and Mr. Titcomb's note in FOREST AND STREAM of the 22d inst., illustrate the interest taken by anglers in the recent references in this paper to the subject of trout tickling. One of my correspondents inquires whether the practice is known to be followed to any extent on this side of the Atlantic, and if so, where. I have only known of it being done by way of experiment in America, and indeed there is no reason why it should be resorted to at all in countries where trout can be so much more easily obtained by lawful means. Those who tickle trout in the Old Country are generally men who dare not be seen on the banks of a stream with rod and line.

Another reader of this paper writes to ask whether guddling for trout is not what is generally known as tickling. Of course it is, and a good example of the use of the term is furnished by Ian Maclaren in his "Beside the Bonnie Briar Bush," where he makes the doctor say, with reference to his youthful experiences, "Guddlin' wes a graund ploy. A' think A'm at aince mair, wi' ma sleeves up tae ma oxters, lying on ma face, wi' naething but the eyes ower the edge o' the stane, an' slippin' ma hands intae the caller water, an' the rush o' the troot, an' grippin' the soople slidderin' body o't an' thrown' 't ower yir head, wi' the red spots glistening on its white belly; it wes michty."

What Do Salmon Flies Represent.

A friend draws my attention to the definition of fishing with the fly contained in one of the newest and handsomest of the works on American fishes advertised in the columns of FOREST AND STREAM. Fly-fishing is there described as "the art of presenting to a fish a bunch of feathers tied to a hook in such a manner that the fish will believe that the aforesaid bunch is something edible and become 'permanently attached' to it." My friend asks me a difficult question when he inquires what special edible a salmon fly represents. Major Fisher, in his "Rod and River," says that it is the general opinion that salmon take the artificial fly for some living thing, probably a shrimp; but he admits that whatever they suppose it to be, it most certainly is not like anything which lives above the surface of the water. He therefore concludes that the term "fly" is a misnomer. The idea that the salmon lure is taken for some living thing or other would seem to be borne out by the fact that it is greedily taken by trout when they are known to be on the feed, and are eagerly devouring natural insects and other food. And the English experience, which shows that natural shrimps are some of the best killing of salmon baits, doubtless encourages the belief of British sportsmen that the fish take the artificial fly for a shrimp. Whatever the Atlantic salmon of American and Canadian rivers take the salmon fly for, however, it is certain that they do not take it for a shrimp or any other natural food, for they invariably refuse the genuine article; and as no kind of undigested food is ever found in their stomachs when the fish have been taken from fresh water on this side of the ocean, many anglers have jumped to the conclusion that they seize the fly to which they rise in North American rivers, either in sport or in anger. The salmon in these waters have certainly not been taken with any other kind of either natural or artificial bait than the ordinary fly, though there are stories of solitary specimens having taken live bait in the brackish waters of estuaries.

The Color of Trout.

Commodore J. U. Gregory, of Quebec, one of the few remaining survivors of the original subscribers to FOREST AND STREAM, was talking in the Garrison Club of the ancient Canadian capital the other night, about the difference in the color of the flesh of trout caught in different waters, and called my attention to certain circumstances which seemed to him to knock out the pet theory that the deeper pink or red coloring of the flesh of some of the *Salmonidæ* is due to the abundance of the crustaceans which form a large proportion of their food supply. The Commodore fished last September in Lac Trois Saumons, a fine body of water, reached by way of the Intercolonial Railway, running in an easterly direction from Levis, opposite Quebec, along the south shore of the St. Lawrence. The lake is swarming with crustacea of various kinds, chiefly small crayfish, with which the stomachs of the fish opened by Mr. Gregory were found to be well filled; yet the flesh of these trout is exceedingly light in color, especially in comparison with that of Lake Edward trout, for example, which is always a deep red, though these latter fish live principally upon the minnows and small gudgeon which abound in the waters in which they are found. Cheney, Agassiz and Lanman have all pointed out how largely the rich red color of the flesh of the brook trout is contributed to by a crustacean diet, yet here is a notable exception, which seems worthy of record. Shall we say that this is only another instance of the exception proving the rule, or is the evidence strong enough to shatter our faith in preconceived opinions of the matter?

Striped Bass and Smelt.

It is not often that striped bass are taken so high up the St. Lawrence as the port of Quebec. Last week, however, one measuring nearly thirty inches in length was captured off the mouth of the St. Charles in the middle of the harbor, by a boy who was fishing with bait for tomcods. The nearest point to Quebec where striped bass, or bar, as they are called by the French-Canadians, are taken in any numbers by anglers, is below the Island of Orleans, in the vicinity of Madame Island. Even here, however, the size of the fish taken has very much deteriorated in recent years. There was a time when such fish as that above described were by no means uncommon. Now they are very seldom seen at all in the St. Lawrence. The reason is not far to seek. In the weirs or wicker net traps along the shores of the river, the market fishermen take fish of all sizes, and it is no uncommon thing to see striped bass of not more than four inches long brought by them to market. This matter is to be brought to the early attention of the Minister of Fisheries.

The arrival of the autumnal run of smelts in the St. Lawrence, in the vicinity of Quebec a few days ago, was quickly followed by that of a number of porpoises which remained for some days disporting themselves in front of the city. The unusual visitors were apparently in pursuit of the toothsome little smelt, and the latter were apparently aware of the fact, for during the time that their monster enemies remained in the neighborhood they were conspicuous by their absence, and the smelt fisher fished in vain. Since the disappearance of the porpoises, the smelt have been on the feed as usual, and large numbers of them are being taken at the various city wharves at every tide, the anglers being quite content to stand the biting cold of the November frost and sleet and cutting wind, for the purpose of enjoying the sport.

Net Fishing of Lake Nepigon.

Lake Nepigon, the source of the famous Nepigon trout river, is to become the scene of one of the most important commercial fisheries of the continent. This is to be prosecuted by a newly incorporated joint stock company, calling itself the Canada Fish Company, with a capital of a million dollars, which has obtained important concessions from the Government of Ontario. The company secures an exclusive privilege for net fishing for a term of twenty years, but is forbidden to take bass or speckled trout, two game varieties for which the region is famous, and no angling rights are in any way to be interfered with. In return for this privilege the company will pay a bonus on a graduated scale, ranging from $2,000 to $20,000 a year, in addition to the usual license fee, based on the amount of apparatus or plant in use; and they undertake to build a railway connecting the Canadian Pacific, which crosses the Nepigon River close to Lake Superior, with the shores of Lake Nepigon, forty miles away to the north. It is provided that no nets shall be set on spawning grounds, nor within a mile of the mouth of any river or stream, nor within a mile of the outlet of the lake into the Nepigon River. The catch of fish is limited to 500 tons a year for the first three years, and to 1,000 tons a year for each subsequent year of the term. The vast quantity of enormous lake trout and whitefish inhabiting this lake makes its fishery wealth of great importance, but its commercial value has, in the past, been practically nil, owing to the lack of railway facilities. By the new arrangement, the Government secures the building of the road, and insures a large annual revenue to the province, without in any way impairing the value of the huge commercial fishes, some of which do not hesitate to make a meal off a good brook trout whenever the opportunity presents itself, and which are noted spawn eaters as well, ought to improve the fly-fishing in the river rather than injure it. The taking of all necessary precautions in this direction was only to have been expected of the minister who made the concession to the company, for the Hon. Mr. Latchford, the gentleman in question, is not only a sportsman himself, but also the president of the North American Fish and Game Protective Association.

Another Salmon Difficulty.

Canadian salmon fishermen on the Pacific coast are claiming another grievance against their American competitors. Whatever the character of the western ocean may be, it is pretty clear by this time that the international relations of those engaged upon its shores, whether in taking seals or salmon, are anything but pacific. Mr. Todd, representing one of the largest canneries upon the British Columbia coast, has lately had an interview with the Minister of Fisheries at Ottawa, to urge that the Canadian regulations be amended so as to provide that traps may be used for catching salmon. Hitherto, though extensively operated within the limits of the American fisheries, these traps have not been permitted in Canadian waters. Mr. Todd pretends that the American fishermen have so arranged their traps as to intercept the fish after they have passed in from the ocean through the Straits of San Juan de Fuca on their way up to the Fraser River. It is claimed by the Canadian fishermen that this condition of affairs is calculated to deplete the salmon fishery, but as the Dominion cannot prevent it, Canadian canners claim that the use of traps should also be permitted on the Canadian fishing grounds, so as to give them the same advantage as that enjoyed by their business rivals. They claim that if traps are advantageously placed off the southern coast of Vancouver Island, no salmon at all would reach the fishermen in United States waters. Something would be apt, however, to reach the authorities at Ottwa, in such a case, and a knowledge of this fact may perhaps have had something to do with the delay of the Canadian ministers in acting upon the demand of the canners.

Canine Elegies and Epitaphs.

XXVIII—Rab.

This tender and touching poem was written on a pet spaniel by Mr. R. T. Chilton, who was private secretary to Daniel Webster:

RAB.

A little mound in the garden,
  Aside from the box-bordered walk,
Tells in such language as flowers
  And only flowers can talk—
(No need of other inscription,
  No need of memorial slab,)
Tells that, all still and silent,
  Underneath lies our little Rab.

And yet in fancy I see him,
  Alert, overflowing with life,
Now racing across the grass-plot
  With the children in playful strife;
Then, with head drooping saucily sideways,
  On his haunches, with heaving breast,
Awaiting the further onset,
  While the children stop to rest.

Rab, with his coat so silky,
  Seal brown set off by white,
With his long, soft ears and his questioning eyes
  Aglow with an inner light;
Shall we see him no more for ever,
  Will he come no more at our call,
He, the delight of the household,
  The merriest, maddest of all?

Ah, Rab! we will miss you sadly,
  As we look at the spot where your name,
Wrought of the Ash's red berries,
  Glows as if written in flame.
And the flowers will bloom and wither,
  For many and many a day,
On the little grave where the children
  Have tenderly laid you away.

A Kentucky Fox Hunt.

Editor Forest and Stream:

I attended the recent meet of The National Foxhunters' Association at Bowling Green, Ky. I have been a member of the association ever since it was organized, but this is the first meet I have been able to get to, but if I had felt—as I now do—what a royal time a visitor has there, I would have been at all of them. With the whole Bowling Green Kennel Club, led by Mr. Meredith, as our welcoming hosts, and such Kentuckian visitors as Messrs. Walker, Williams, the Chinns, the Triggs, Bosworth, Kirby, Finck, Mitchell, Smith, Graddy, Sturgeon, Delaney, Draughan, etc., an oak log would have its heart warmed up. True, getting up at 3 A. M., having a scratch breakfast, riding four to six miles out in the dark, was not what some people would call "fun," but then I so called it, and it seemed to me that all hands did. Of course, such a blind bat as I am could not think of saddling it at that time, when I could not see my hand before my face, so I adopted the somewhat out of the way plan of riding out in a buggy, leading a saddle horse, and mounting when it became light enough to see, and I got some mild chaffing about foxhunting in a buggy. But if my buggy had not been on hand, there might have been trouble in getting home one of the crack hounds which was taken very sick and found by accident in the woods. Of course Kentucky ladies attended, you may trust them never to shut the light of their faces off from foxhunters.

I have never seen one of the fashionable, set-to-order foxhunts of eastern Pennsylvania and New York, where the hounds seem incidents, and the horses the main thing, as witness the last Era, with about a dozen pictures of horses and riders, to one very poor one of hounds. That style of foxhunting is doubtless all right to those who like it, but it is not the sport I learned to love years since when the company were pretty much all mountain moonshiners, who finally lodged in jail. Nevertheless, we had fun, lots and lots of it, and the Kentucky hunting is that same type of sport, but followed by gentlemen and ladies. Then there is a suspicious air of being dressed to death in those Era pictures, and while that is all right in the ladies ("the first duty of woman being to look well"), still I don't like foxhunting with shiny boots; it is too starched for my taste. However, when "hunters" can find any fun in fooling a pack of hounds with an anise bag, there is no saying what "sport" is, bar that "fox terrier coursing" isn't.

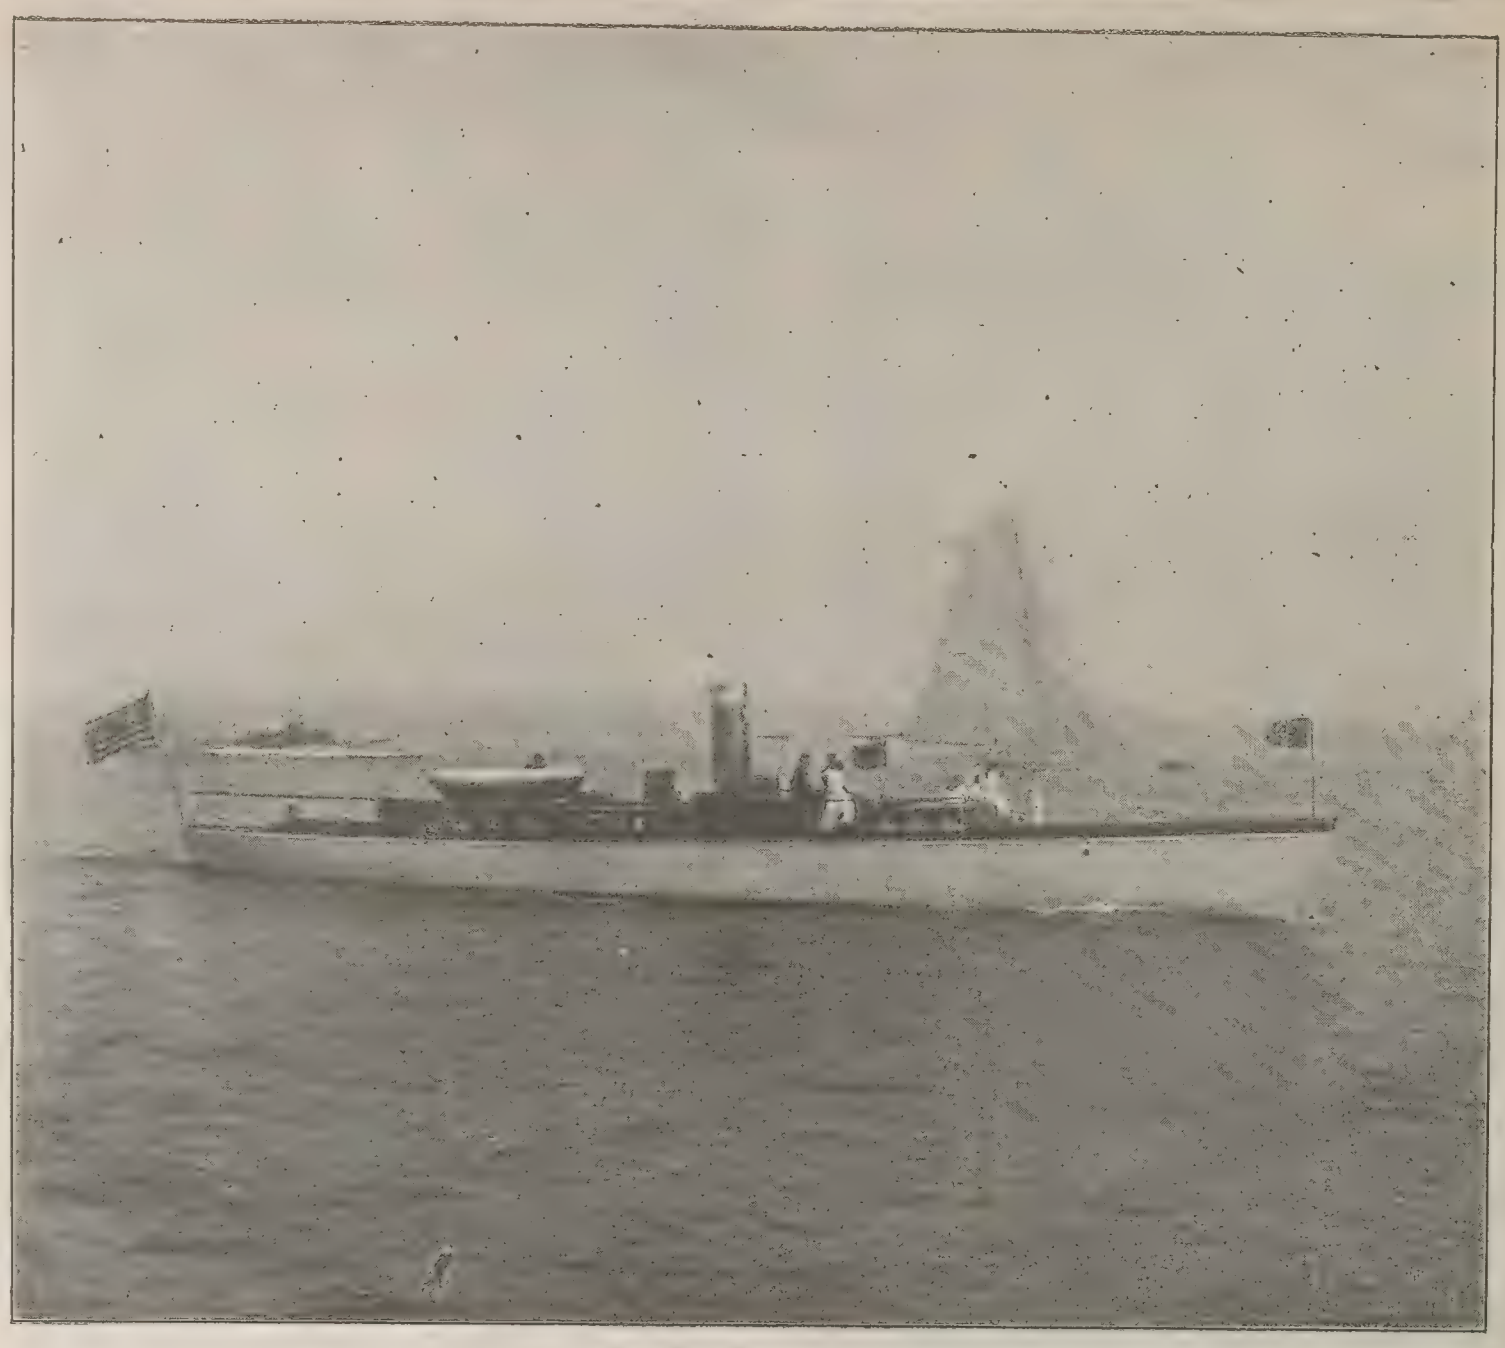
Well, do you want a detailed report of the hunting? Sorry to say I have none to set forth, further than that the conditions were about as unsatisfactory as could be. We were just at the waning of a long drought, the wind was rather high most of the time, and our early starts were to take advantage of the morning dews. But for all of that, while the grass was damp enough to wet our boots, still no scent seemed to lie; losses were constant; the hounds worked hard, but it was rare to have a well sustained full cry for fifteen minutes. So, as far as actual foxhunting went, the meet was by no means a success. But wasn't it delightful all the same! Well, just you come and try one once, and you will not need to ask me or anybody whether a Kentucky hunt is enjoyable or not. And really that is the chief object of this to impress it on the family of FOREST AND STREAM, that all who enjoy such sports as foxhunting, ought, by all means, to go to one of the Kentucky meets.

On Friday evening one gentleman quietly informed us that I was going home with him for a week. If you know anything of Kentuckians you will know that my having left my wife without another person in the house but servants, that I had lots of things requiring my looking after at home, etc., did not count in such a situation; and you will further know that I went, and you ought to know that I thoroughly enjoyed my visit, even if I could not make it the whole week. And that wasn't all. On that Friday evening we had a gentle but copious fall of rain, making hunting conditions admirable, and on Saturday evening we went out, and for forty-five minutes or so had the finest full cry of the hounds; in fact, the only one I heard during the whole of my visit to Kentucky. What if it was only a gray, the music was not the less rich or well sustained. So the sum and substance of it is: Go to Kentucky when you want a good time.

Another matter at Bowling Green interested me very much. At the county jail I saw a pack of four "American bloodhounds," used very successfully for tracking criminals. I expected to see a very ragged looking lot of dogs, of all types and no type; but to my surprise I saw four hounds, very "sorty," of the old type of black and tan native foxhounds, on very short legs, the kind we used to say would "run all week and half the next." The most surprising fact was that two of them were half English bloodhound in blood, and, with, perhaps, a slight amount more of tan on heads. There was no real difference between them, either in makeup or in voice, none had the redundant and useless dewlaps and wrinkle of the English bloodhound, apparently caused by their skins being one-half too big for them, that is so characteristic of the modern English bloodhound; but all were neat, active, clean-made hounds; not the hounds for a fox chase, by any means, but just suited for staying on the trail of a man all day long. Of course, I was not surprised to find them exceedingly affectionate and solicitous of notice.

We are apt to think of Kentucky as the land of whiskey; yet, do you know, that during the whole week I was there I saw but two drunken men, one a loafer on the streets, the other the darky huntsman after the hunt. And do you know that Kentucky has the largest percentage of local option prohibition area of any State in the Union? W. WADE.

OAKMONT, Pa., Nov. 27.



SCOUT—HIGH-SPEED STEAM YACHT.
Designed and built by the Herreshoff Mfg. Co. Owned by August Belmont. Photo by James Burton, Esq.

"A Hair of the Dog that Bit You."

The following remarks are copied from the recent issue of a local newspaper: "This phrase, though now confined to a symbolic and alcoholic interpretation, has an accurately canine origin. In the Caucasus it is still common for any one who is bitten by a dog to lay a handful of hair taken from the same animal's coat upon the wound before cauterizing and bandaging it. In some mystic way the hair is supposed to prevent untoward consequences."

The efficacy of this usage is referred to by Pliny. (Nat. Hist.," 1601.) Holland's translation has: "And there bee some againe, who burne the haires of the same mad doggs taile, and conveigh their ashes handsomely in some tent of lint into the wound."—Notes and Queries.

In France there exists an order of merit founded by the Society for the Prevention of Cruelty to Animals, of which the members are dogs who have distinguished themselves by deeds of bravery. A tastefully designed "collar of honor" is awarded to the nominees of the order. Among the animals already decorated in this way one of the most celebrated is Bacchus, a large bulldog, whose specialty it is to stop runaway horses by jumping up and seizing them by the bridle. Bacchus' master resides in the Rue Biscornet. It is calculated that the intelligent beast has already saved the lives of eight persons, if not more, in this way. Pataud, another bulldog, received a collar for saving his mistress from the attack of a footpad, and Turk, a splendid Newfoundland, has had a similar honor for saving three young children from drowning on different occasions.

Yachting.

40-Foot Cruising Launch.

WE reproduce this week the plans of a 40ft. cruising launch that was designed by Mr. W. Starling Burgess, of Boston. The lines show a well-turned craft that should be driven fast with a moderate amount of power.

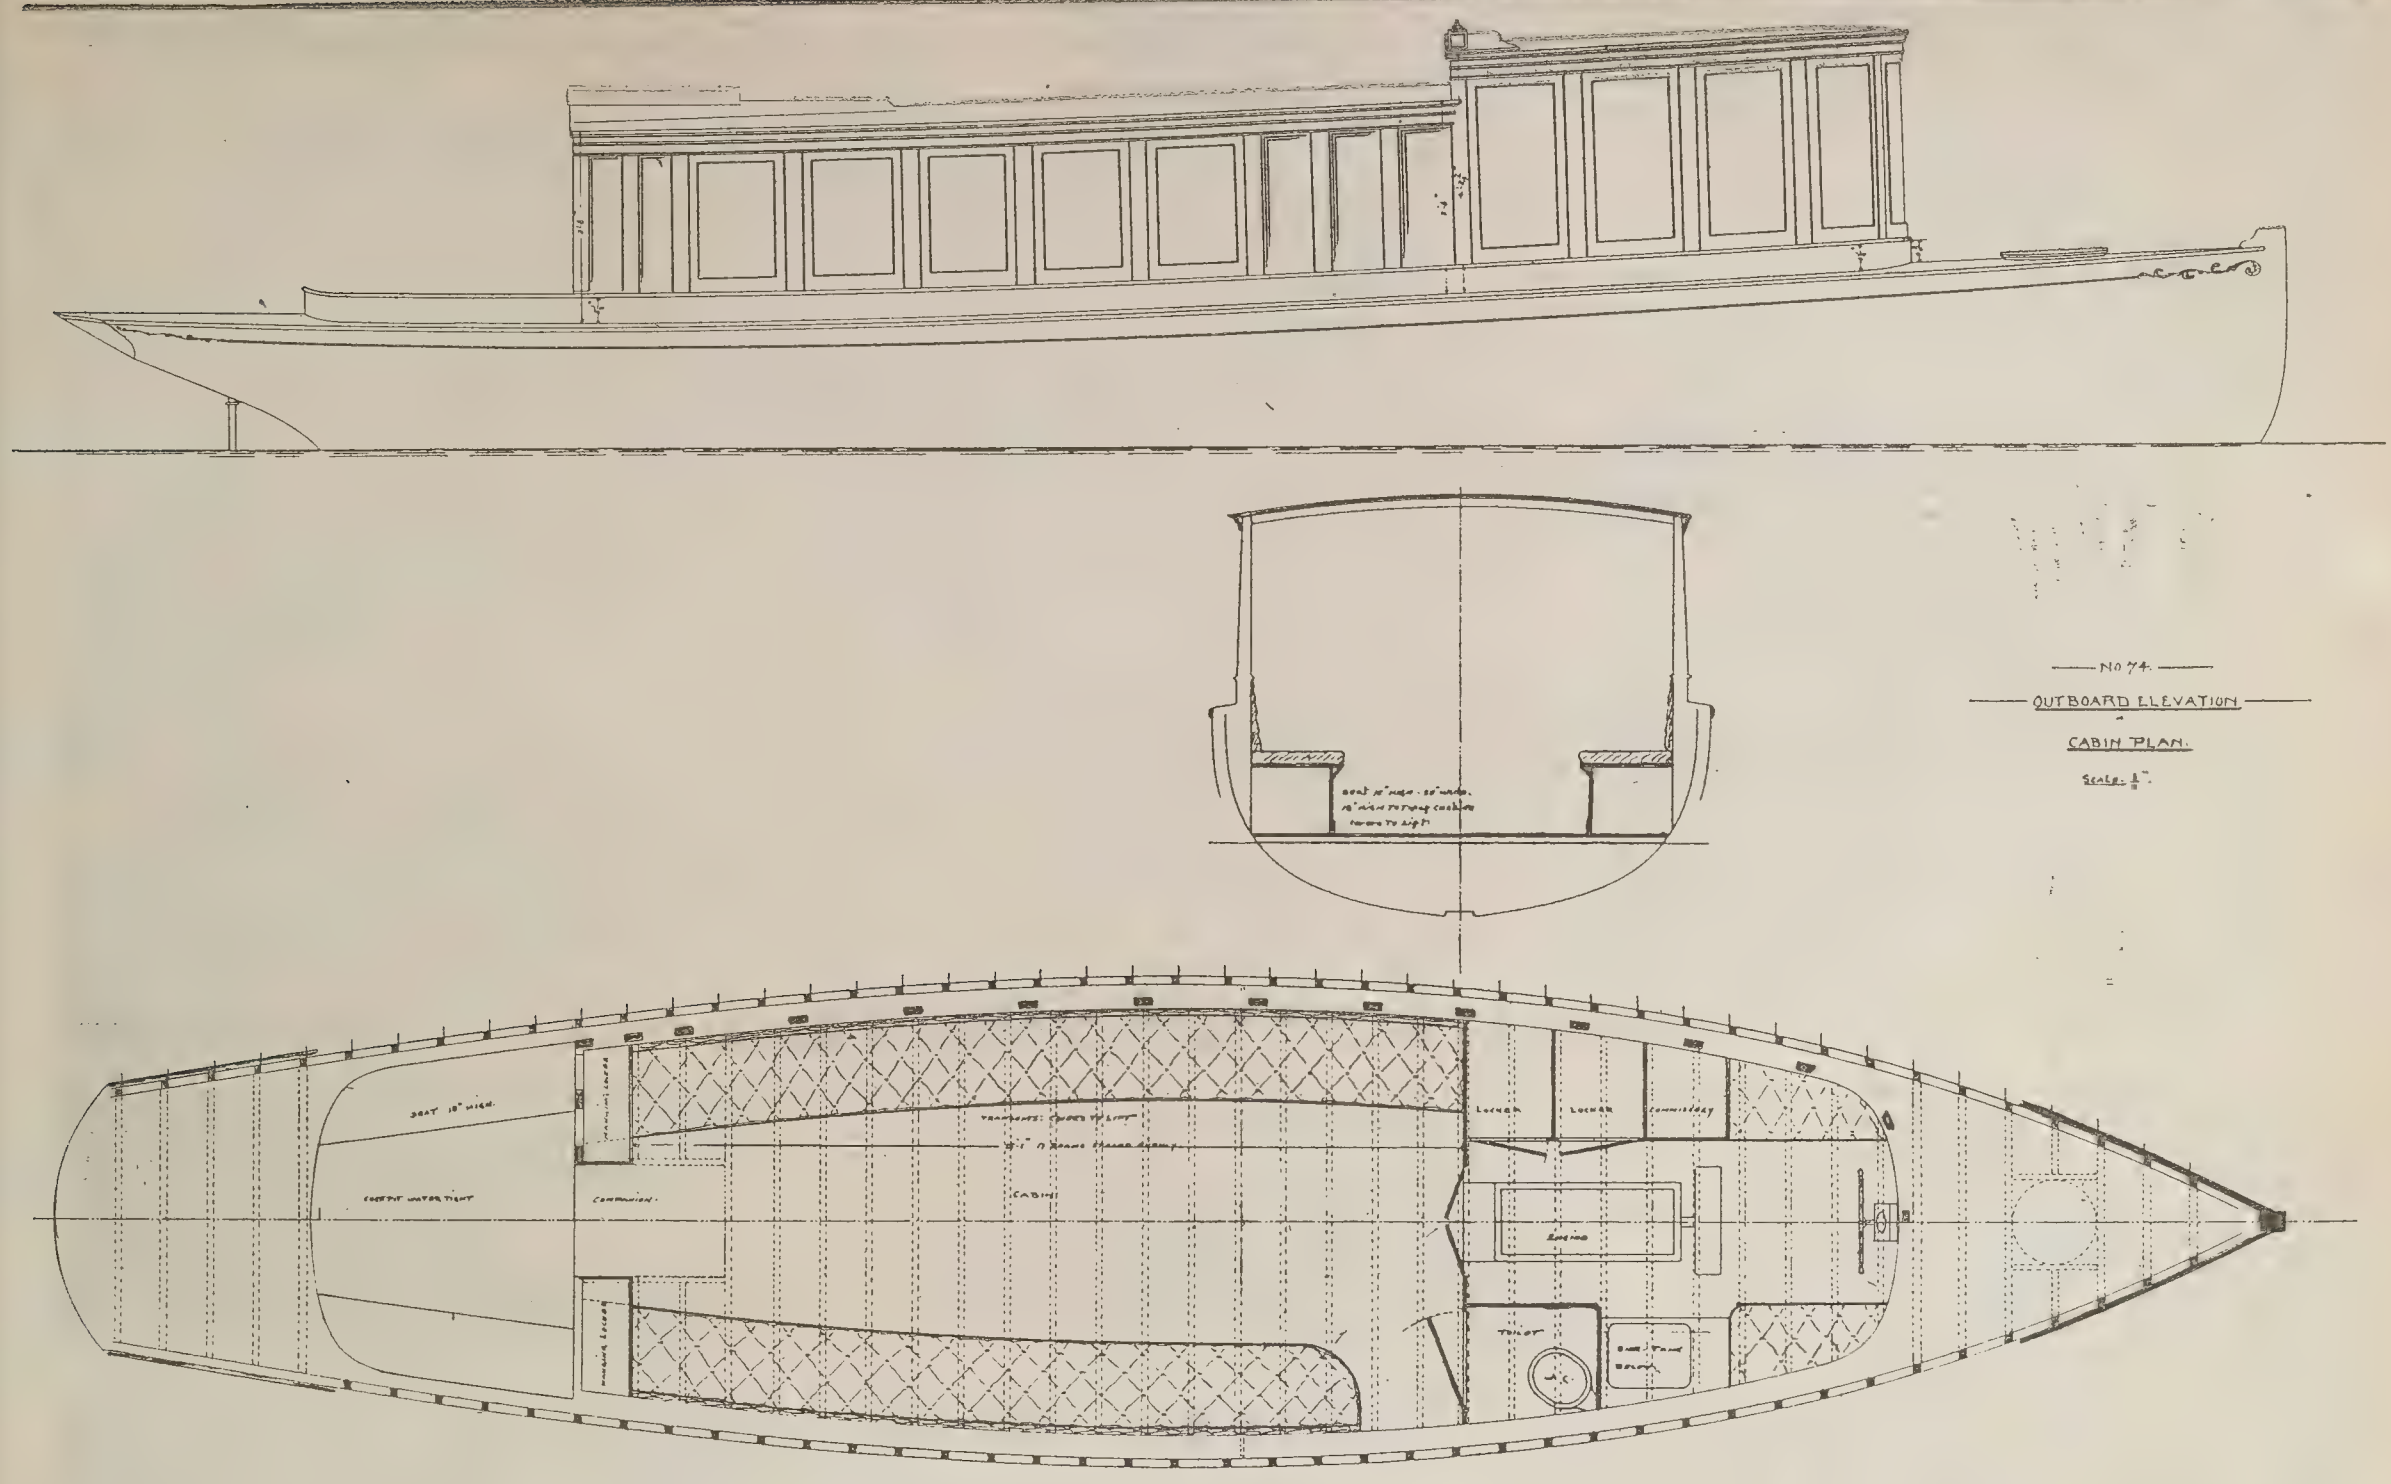
The location of the engine is rather unusual, but by placing it so far forward it is possible for one man to run the boat and the engine at all times. The forward house serves as a galley, engine room and pilot house. This is shut off from the big cabin aft which is over 15ft. long. There is sleeping accommodation in the saloon for four persons. The toilet room is reached from the forward end and aft there are roomy hanging lockers. A good-sized water-tight cockpit makes a very comfortable place for those who wish to be on deck.

The boat is splendidly built and presents a very shippy appearance in the water. Her dimensions follow:

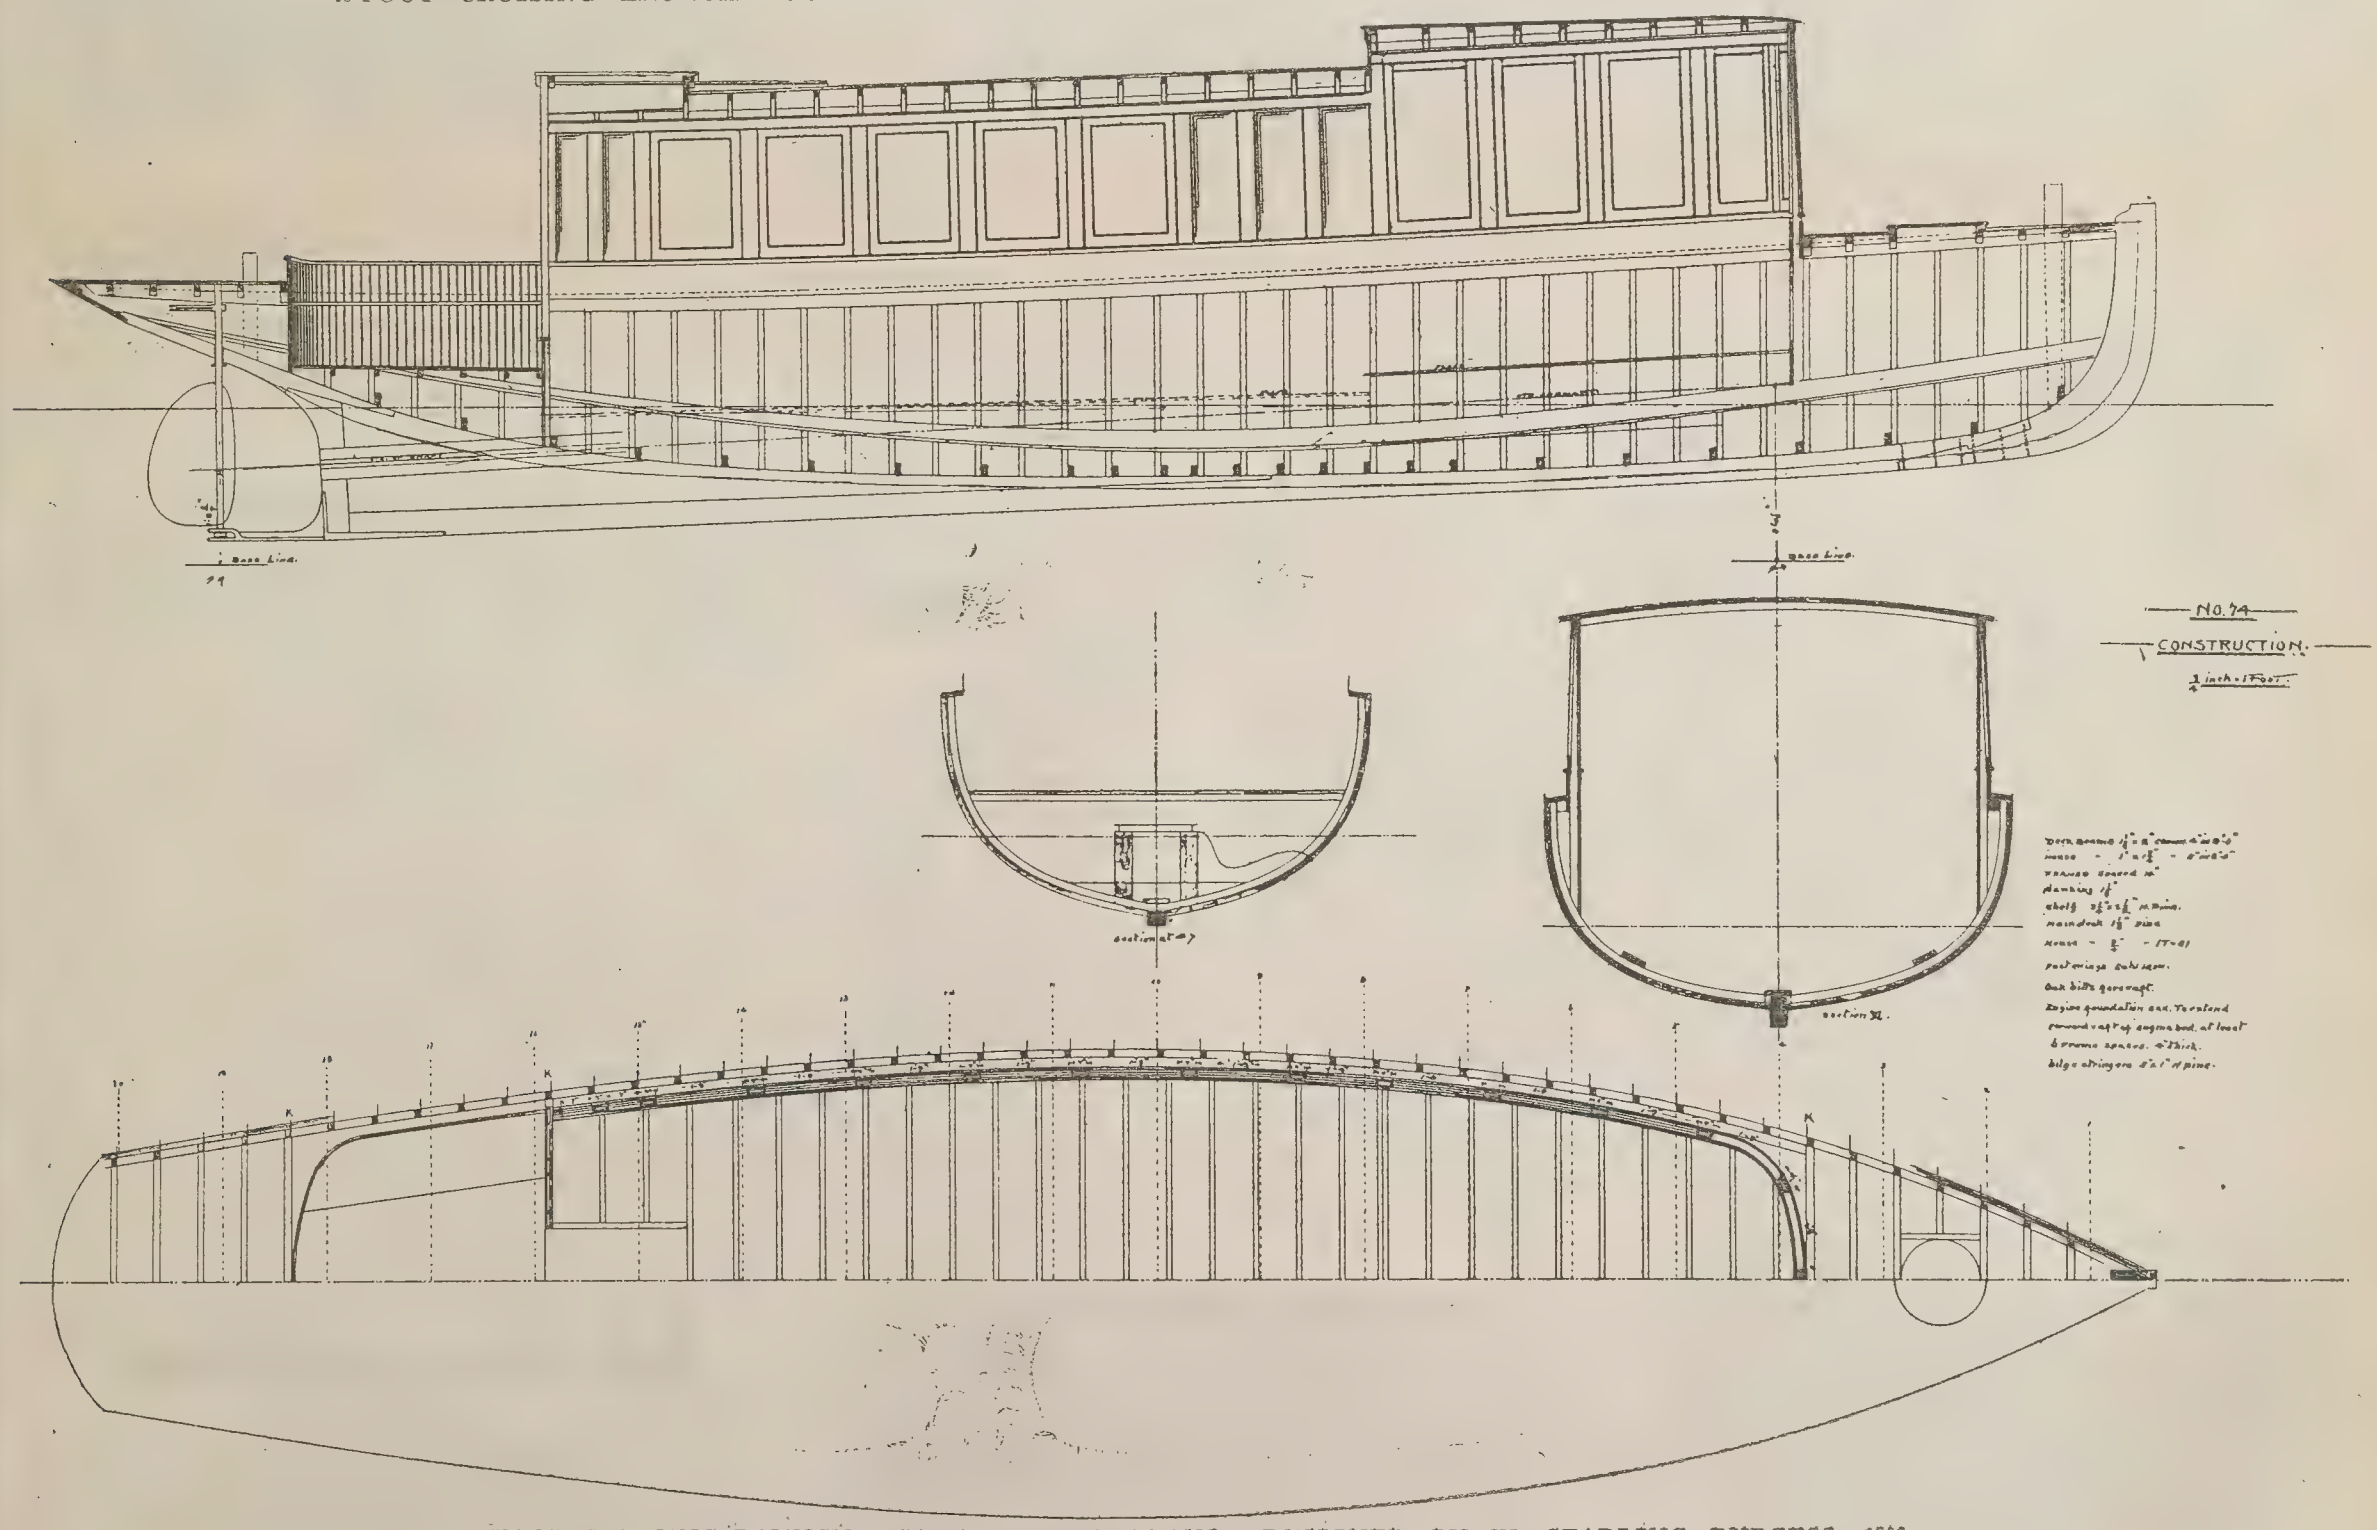
Length—		
Over all	40ft.	7in.
L.W.L.	35ft.	3in.
Overhang—		
Forward	0ft.	6in.
Aft	4ft.	10in.
Breadth—		
Extreme	9ft.	1in.
L.W.L.	8ft.	0in.
Draft—		
Extreme	2ft.	6in.
Freeboard—		
Forward	3ft.	6in.
Least	2ft.	2in.
Aft	2ft.	4in.

Boston Letter.

BOSTON, Nov. 30.—At a meeting of the Corinthian Y. C. held at the American House last Tuesday evening, it was unanimously voted to adopt the new 22ft. class, conforming to the limitations of the Twenty-two-Foot Cabin Yacht Association. The action of the Corinthian Y. C. is hailed with joy by the organizers of the new class, and especially by Mr. Sumner H. Foster, who has done most of the work in forming it. With this backing to start with, it is considered that yachtsmen, who looked favorably upon the class and who have had doubts of its success on account of insufficient support, will now build. Mr. Foster said last week that he had assurance that at least four boats would



40-FOOT CRUISING LAUNCH—OUTBOARD PROFILE AND CABIN PLANS—DESIGNED BY W. STARLING BURGESS, 1902.



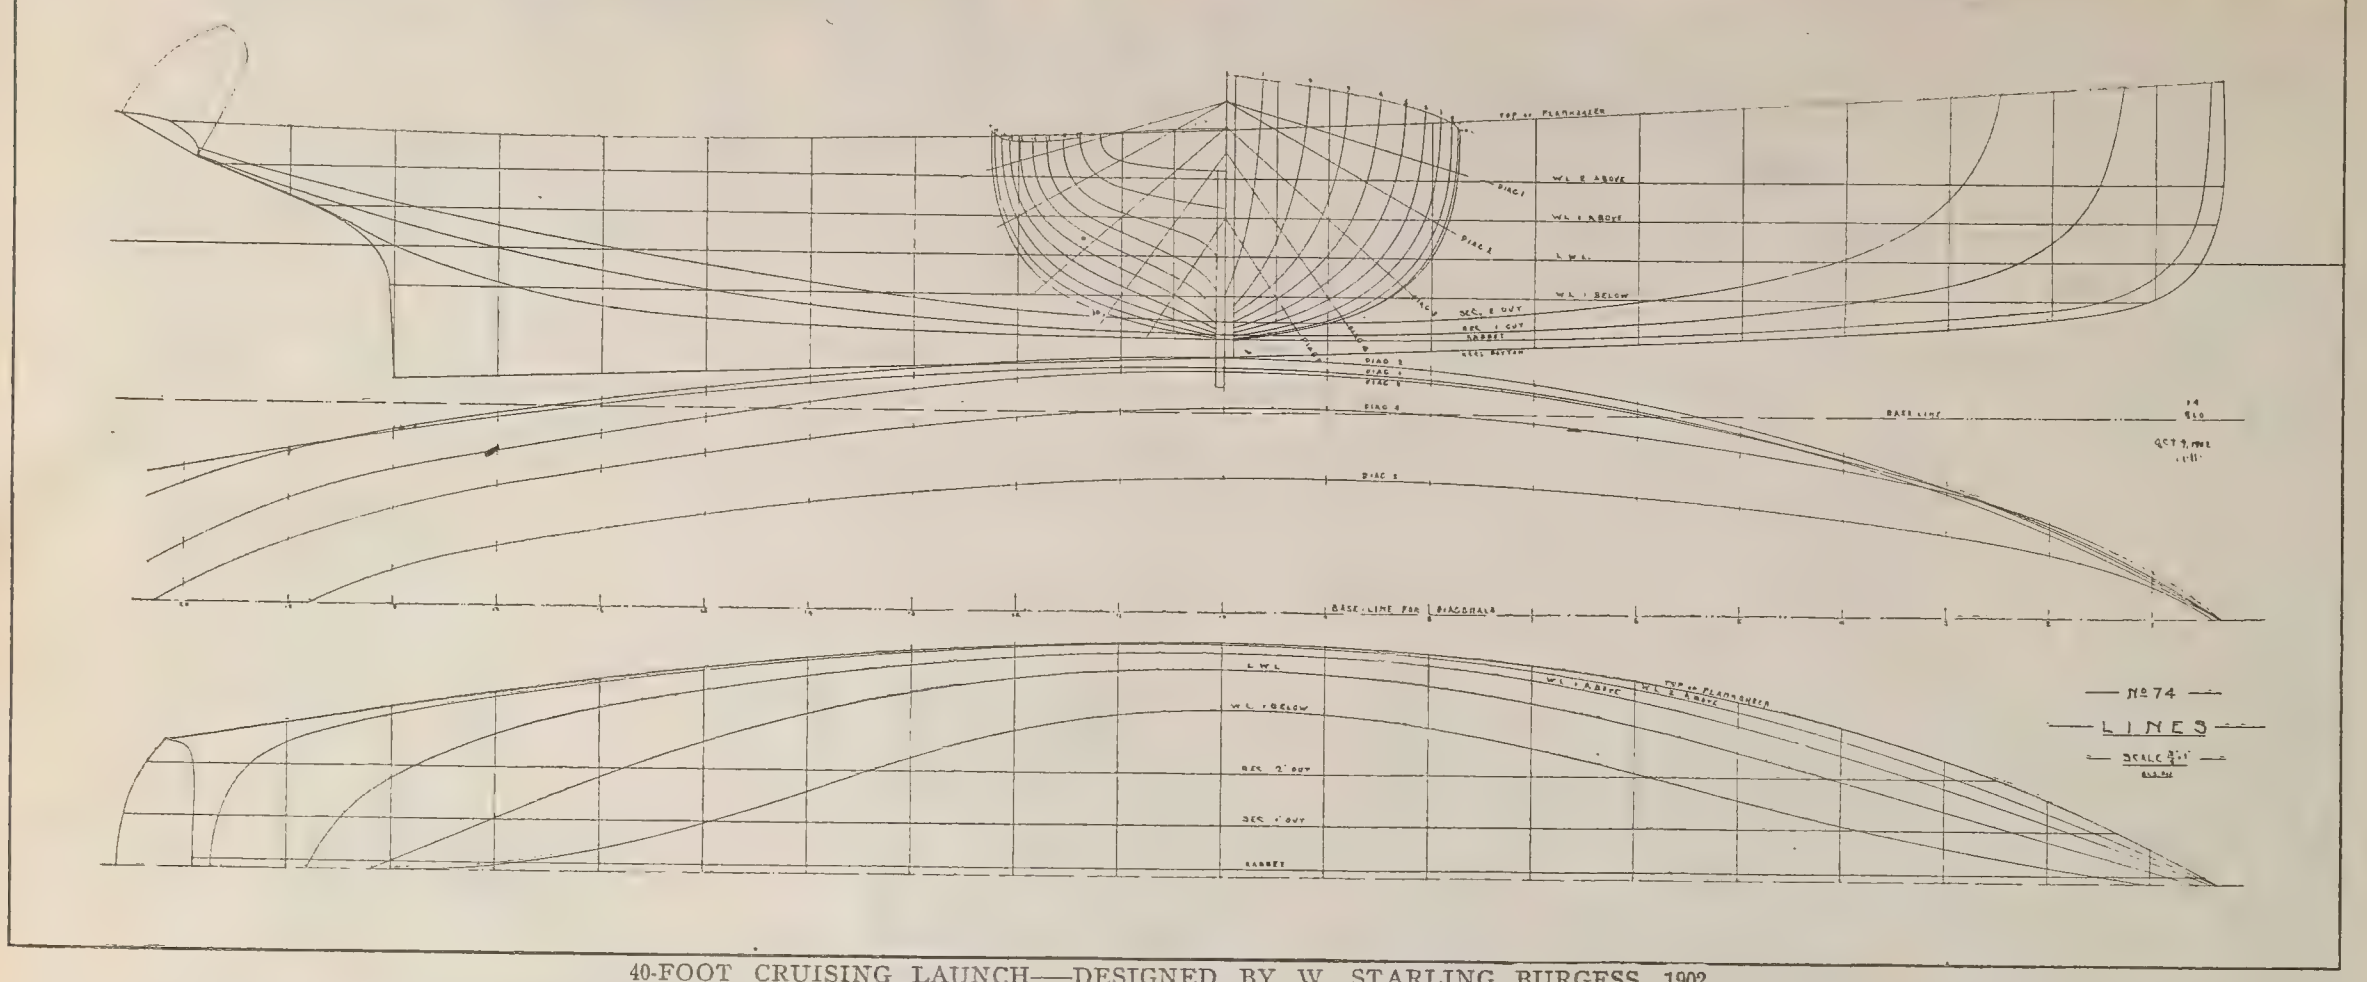
40-FOOT CRUISING LAUNCH—CONSTRUCTION PLANS—DESIGNED BY W. STARLING BURGESS, 1902.

be built for the class, and that he had hopes of more prospective owners showing up now that the class has received the support of one of the largest clubs in the bay.

At the meeting of the Corinthian Y. C. the following commitee was elected to nominate officers, to be voted for at the annual meeting: Frank E. Clark, George P. Hodgdon, F. W. Moore, F. A. Gunnison and Roland Worthington.

Some time ago a movement was started by members of some of the North Shore clubs to revive the raceabout class. At the time considerable interest was manifested, but subsequent developments do not augur much success for the revival movement. It is not known that any orders for raceabouts have been placed up to date, and from the present outlook there does not seem to be much prospect of any. There are yachtsmen who want to build and will do so if there is any assurance of a number of boats built for the class, but they do not appear to relish the idea of going it alone. Some of those who were most interested in reviving the class have since said that they did not intend to build, and this has undoubtedly held others off. At present it looks as though the decline of the raceabout in Massachusetts Bay is for good. It will take only the hardest kind of work and thorough organization to bring it back to the popularity it enjoyed three years ago.

The classes of the Yacht Racing Association are still in the unsettled state they were left in after the last special meeting. Work upon three 25-footers is still going on, and these boats will probably race, although it is considered doubtful if the boats that raced in the class last year will compete with them. At Fenton's the 25-footer designed by Burgess for Mr. F. G. Macomber, Jr., has been finished and hauled out of the shop, and work has been started on the 25-footer by the same designer for Mr. T. K. Lothrop, Jr. There have been no new 21-footers heard of, and it is not likely that there will be while the rules are in their present unsettled, unsatisfactory shape. The movement is still on foot to race the boats of normal dimen-



40-FOOT CRUISING LAUNCH—DESIGNED BY W. STARLING BURGESS, 1902.

sions in this class next season. Three of these boats have already been sold, but it is thought that there will be enough left to warrant clubs giving races for them.

A change of considerable importance was made in the office of one of Boston's most prominent designers last week. W. Starling Burgess has formed a partnership with Alpheus A. Packard, recently with the Herreshoff Manufacturing Co. Mr. Packard has been superintendent of the Herreshoff shops, which position he left only within a few days to join Mr. Burgess. Mr. Packard worked upon the construction of the Columbia, but was not at the works when Constitution was built. He worked upon all of the preliminary details of the new Cup defender, and it was he who laid her down. He has also been connected with the New York Shipbuilding Co. The advent of Mr. Packard in the office of Mr. Burgess is an important one, as by it two very strong forces are joined, one on the theory of naval architecture and the other on construction. Beside being a constructor, Mr. Packard is considerable of a draftsman. At present they will continue the work of yacht designing at Mr. Burgess' offices, but further developments of this partnership may be looked for later.

Yacht designing offices have been on the increase in Boston lately. J. R. Daniell is now drafting in the brokerage office of Frank N. Tandy, and E. R. Boardman, formerly associated with Crowninshield, has started out for himself as a naval architect, yacht and ship broker at 20 Central street. Mr. Boardman only started in housekeeping last week, but he hopes to get several orders through before long, which are now being considered.

At the Marblehead yacht yard plans are being made by W. B. Stearns for a 40ft. auxiliary yawl for J. P. Elton, of Waterbury, Conn. Her deck and cabin fittings will be of teak and she will be fitted up for long cruises. She will be launched some time in May. Several launches are to be built, from 14 to 36ft. An order has been received for a sailing tender for Gordon Dexter's 46-footer, Wasp. A new deck, cockpit and companionway will be put on the 40-footer Gorilla. Extensive alterations are to be made in the Kiowa, owned by G. S. Payson. A launch owned by H. A. Church is to be rebuilt. Among the yachts hauled out in the two yards are the following: Ameria, C. W. Sherburne; Gorilla, Joseph Battles; Barbara, Robert T. Paine, 2d; Katonah, Dr. Dudley Williams; Intrepid, Henry A. Church; Ranger, H. A. King; Umbrina, J. P. Elton; Kiowa, George S. Payson; Chasca, Dexter H. Follett; Golden Rod, G. E. Bruce; Chickadee, F. E. Peabody; Khedive, Joseph Bigelow; Grig, Franklin Dexter; Cock Robin, C. S. Eaton; Wyvern, R. K. Longfellow; Suzanne, Frank Brewster; Scud, C. P. Curtis, and Sanderling, J. R. Thorndike.

At Lawley's the 166ft. steel steam yacht, designed by A. S. Cheseborough for Mr. C. A. Fletcher, is about all plated. An order was received last week for another steel steam yacht of Mr. Cheseborough's design, for Mr. Charles G. Emery, of the New York Y. C. She will be 116ft. on the waterline and is expected to develop a speed of sixteen knots. The 60ft. schooner for Mr. C. H. Clark has been set up and the 50ft. ketch for Mr. J. H. Cromwell has been planked and the deck laid. The 34ft. yawl for Mr. F. H. Adriance is in frame. A 36-footer for Mr. W. B. Rogers has been set up. Major L. S. Bent's 50ft. schooner has been laid down, as has been a cruising 21-footer for Mr. L. H. Spaulding. A set of boats is being built for Mr. W. C. Cox's steam yacht. This yacht is now building by Ramage & Ferguson, at Leith, Scotland, and is expected to arrive at his port late in April.

Hollis Burgess has sold the 21-footer, Opitsah IV., to a Philadelphia yachtsman, who wishes to remain unknown for the present. She will be shipped by rail to Philadelphia and will be used on the upper Delaware.

Small Bros. have an order for a 26ft. hunting launch for Mr. I. S. Carpenter. The lines of a 28ft. cruising yawl have been turned out for Mr. S. H. Eldridge, a summer resident of Hyannisport.

JOHN B. KILLEEN.

The Nilson Yacht Building Co., Baltimore, Md., are building for Messrs. Richard P. Hart and Henry Burden, 2d, a steam yacht from designs made by Messrs. Tams, Lemoine & Crane. She is to be 126ft. 6in. over all, 110ft. waterline, 20ft. breadth and 6ft. 6in. draft.

New York Y. C.

COM. LEWIS CASS LEDYARD presided at the special meeting of the New York Y. C., held at the club house on West Forty-fourth street, New York city, on Monday night, Dec. 1. The meeting was well attended.

Owing to the Cup races which take place next season, it was deemed necessary to lay out the programme of the season's racing in order that it would not in any way conflict with the international contests. The schedule of the racing as adopted follows:

Thursday, May 21, Saturday, May 23, and Monday, May 25—Special races for the 90-footers, on Long Island Sound, off Glen Cove.

Thursday, June 4, Friday, June 5, and Saturday, June 6—Special races for the 90-footers, at Newport.

Thursday, June 11—Annual regatta in the lower bay. High water at Governor's Island at 8:45 A. M.

Monday, June 15—Races for the Glen Cove cups, on Long Island Sound, off Glen Cove.

Thursday, June 18, Saturday, June 20, and Monday, June 22—Newport series, at Newport, R. I.

Annual Cruise—Thursday, July 16, rendezvous at Glen Cove; Friday, July 17, squadron race to Morris Cove, New London; Saturday, July 18, squadron race to New London; Sunday, July 19, at New London; Monday, July 20, squadron race to Newport; Tuesday, July 21, races for the Astor cups, at Newport; Wednesday, July 22, squadron race to Vineyard Haven; Thursday, July 23, squadron race to Newport; Friday, July 24, races at Newport for the Owl and Game Cock colors. Disband.

Tuesday, July 28, Thursday, July 30, and Saturday, Aug. 1—Trial races at Newport for the selection of the defenders of the America's Cup.

Thursday, Aug. 20, Saturday, Aug. 22, Tuesday, Aug. 25, Thursday, Aug. 27, and Saturday, Aug. 29—International challenge races for the America's Cup, off the Sandy Hook Lightship.

Thursday, Sept. 17—Races for the Autumn cups, on Long Island Sound, off Glen Cove.

After passing the racing schedule the members acted for the second time upon the new measurement and classification rules as finally amended. There was no opposition and the rules will be in force for a period of five years.

A committee made up of ex-Com. S. Nicholson Kane, T. A. Bronson, chairman of the House Committee; Rear-Admiral Erben, U. S. N.; Fordham Morris and Capt. J. D. J. Kelly, U. S. N., was appointed to arrange a series of lectures to be given in the club. These lectures will begin in January and will continue on at intervals of three weeks until the racing season opens.

Messrs. Anson Phelps Stokes, Lloyd Phoenix and Robert E. Tod, the gentlemen who were appointed at the meeting held on Oct. 30, to look into the question of a club cruise in West Indian waters, reported that the cruise could not be brought about for this season.

YACHTING NEWS NOTES.

Mr. William H. Hand, Jr., New Bedford, Mass., already has a number of boats building from his own designs. A 31ft. waterline cruising yawl is being constructed at the Newport Ship Yard, Newport, R. I., for Thomas J. Carlton, M. D., of Savannah, Ga.; the 25-footer building at the same yard for Mr. F. P. Sands has been completed and run out of the shop. Other boats now building include a 21-footer for Mr. H. E. Carse, Los Angeles, Cal.; 21-footer for Mr. P. E. Phillips, Detroit, Mich.; 18-footer for Mr. W. Morly Buck, Port Dover, Ont., Canada; 26ft. yawl for Mr. George Schofield, Toronto, Ont., Canada; 18-footer for Mr. J. Ashley Gibson, of Mobile, Ala.; 18-footer for Mr. J. Hugh Weir, Hamilton, Ont., Canada; 15-footer for a Chicago yachtsman. Mr. Hand is now working on plans for two 50ft. sea-going launches and a 40ft. yawl for a Western yachtsman.

Mr. W. R. Osborne, Croton, N. Y., launched from his yard on Saturday, Nov. 22, a house-boat, which he built for General Louis Fitzgerald, of New York city. The new boat, which will be known as Bonito, is 100ft. long, 23ft. breadth and 3ft. draft. The yacht is heavily built and will be driven by two 25 horse-power gasoline motors. In addition to the main saloon, which is in the forward part of the boat, there are four staterooms and bathrooms. Aft of these is the galley and pantry, and next comes the engine room. Still further aft are the quarters for the servants and crew. The upper deck is free from all obstructions and is to be covered with an awning. Bonito is being put in readiness for a cruise in Florida waters.

The steam yacht designed by Mr. Albert S. Cheseborough for Mr. Charles G. Emery, will be built by the Geo. Lawley & Son, Corp., South Boston, Mass. The new yacht will be known as Calumet. She is 145ft. over all, 117ft. waterline, 17ft. 6in. breadth, and 6ft. 4in. draft. The yacht will be built of nickled steel throughout. She will have triple expansion engines, which will drive the yacht at a speed of nineteen knots. Calumet will be very completely fitted, and when finished will be used for cruising along our coast and on the St. Lawrence.

The new yacht that Mr. J. Beavor Webb has designed for Mr. Lloyd Phoenix, will be slightly smaller than Intrepid. It is said she will be 127ft. on the waterline, 28ft. breadth and 16ft. draft. She is to be rigged as a two-masted schooner, but when off shore cruises are taken the long main boom will be dispensed with and a jigger mast will be stepped. The new boat is to be completed on Sept. 1, 1903.

Manning's agency has sold the centerboard schooner yacht Wayfarer for Mr. W. M. Ivins, N. Y. Y. C., to Mr. Edward L. Ryerson, of Chicago, Ill. The same agency has sold the gasoline launch Scimitar to Mr. D. R. Dunlap, of Mobile, Ala., and has also sold the twin screw cruising launch Genevieve to Mr. Leonard D. Richards.

Fortuna, owned by Mr. Henry R. Wolcott, is being fitted out at New London for a Southern cruise.

Gerhilde, Mr. Charles Robinson Smith's new boat, left Gravesend Bay on Friday, Nov. 28, for Norfolk, Va.

Mr. Albert C. Bostwick has commissioned Messrs. A. Cary Smith & Barbey to design for him an auxiliary schooner. The yacht will be built by the Harlan & Hollingsworth Co., of Wilmington, Del. The new boat is the same length on the waterline as the German Emperor's schooner Meteor, designed by the same firm. Mr. Bostwick's boat will be built of steel throughout and the contract calls for the vessel's completion by July 1, 1903. The principal dimensions follow: 158ft. over all, 120ft. waterline, 27ft. 6in. breadth. Her engines will be of 200 horse-power.

Rifle Range and Gallery.

Ossining Gun Club.

OSSINING, N. Y., Nov. 29.—The re-entry rifle matches of the Ossining Gun Club closed Thanksgiving Day with winners as follows:

Members, shoot-off: D. Brandreth 232, I. T. Washburn 222.

Non-members: Geo. N. Tompkins 242.

Ladies: Mrs. E. F. Ball 236, Miss Frances Gibson 235, with a possible 236. Target submitted to expert for decision.

Cadets: E. H. Sherwood 229.

The prizes in all the above classes are handsome silver cups.

The following scores were made on the 50ft. range, ¼in. 25-ring target, 10-shot scores: G. B. Palmer 171; Miss Frances Gibson 218, 227, 221, 235, 230, 226; C. G. Blandford 234, 233, T. Wynants 236, 232; Wm. Coleman 229; Warren Thompson 219, 225; I. M. Sheldon 230; D. Brandreth 235, 237, 237, 238, 239; Dr. E. B. Sherwood 227, 230, 232, 224; A. Bedell 230; I. T. Washburn 237, 240, 236, 235, 236; C. G. Washburn 222, 220, 225, 227, 228, 232; Geo. Tompkins 231, 242, 238; Mrs. E. F. Ball 225, 220, 226.

Matches: C. G. Blandford 227, vs. D. Brandreth 225. C. G. Blandford 229, vs. D. Brandreth 225. D. Brandreth 239, vs. C. G. Blandford 231. C. G. Blandford 237, vs. D. Brandreth 228.

A new series of prize contests will shortly be inaugurated on a 75ft. range, and new and heavier rifles will be supplied. By the time the next contest closes we hope to be able to show as good scores on the 75ft. range as we have previously made on the 50ft. one.

E. F. B.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 25.—Dover, N. J.—Holiday live-bird shoot of the Dover Gun Club. Bull shoot the special event.

Dec. 25.—Interstate Park, L. I.—John S. Wright's target tournament, sweepstakes, etc.

Dec. 25.—Interstate Park, L. I.—John S. Wright's target shoot.

Hell Gate Gun Club's shoot, fourth Tuesday of each month (July and December excepted), at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Hell Gate Annex shoot, second Friday of each month (January and July excepted), at Dexter Park, Brooklyn.

Brooklyn Gun Club's shoot, Saturdays, at Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

South Side Gun Club's shoot, Saturdays, South Broad street, Newark, N. J., near Lehigh Valley coal depot.

Outwater's grounds, Carlstadt, N. J., Saturdays, live-bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private*6* ing grounds always ready for target matches, club shoots or private practice.

1903.

Jan. 1.—Interstate Park, L. I.—New Year's Day target tournament.

Jan. 1.—Interstate Park, L. I.—Interstate Park target tournament.

Feb. 9-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

A trapshooting tournament will be given in connection with the Detroit Automobile and Sportsmen's show, to be held at Detroit, Mich., Feb. 9 to 14, inclusive. Concerning it Mr. S. G. Lewis, the secretary, writes us as follows: "It will be held under the auspices of the Tri-State Automobile and Sporting Goods Association, at the Rusch House grounds. There will be at least $500 added money. This amount has already been pledged, and we hope to make it $1,000. At any rate, the shoot will be of sufficient importance to attract the best talent in this line throughout the country. Mr. John Parker is at work arranging details, and will have other parties associated with him in the arrangement of this shoot. The high gun system of dividing prizes will prevail, and we will inaugurate the Great Western Handicap, 25 birds, $25. In addition to the added money in this event, there will be a valuable trophy, which will become the personal property of the winner. The International trophy, 15 birds, $15 entrance, will be at live birds and targets. The handicap on targets will range from 16 to 21yds. On live birds, 26 to 32yds.

The Thanksgiving Day shoot of the Ossining Gun Club was a pleasant gathering of choice spirits. Several special events were a part of the programme. Ossining and Poughkeepsie shot a four-man team match for the Inter-county cup, and Poughkeepsie in due form scored a win, and is now ready for further trouble. The medal contest, at 50 targets, for the championship of Westchester county was won by Mr. A. Bedell, with the excellent score of 47, Mr. E. Ball pressing him closely with a score of 46. The prize cup donated by Mr. F. Brandreth for those who had never previously won a trophy, was captured by Mr. R. Kromer, Jr., with a score of 25, his handicap of 3 being just sufficient to make the maximum when added to the 22 which he broke.. Mr. J. T. Skelly was one of the visitors, and was one of the three high averages, as follows: C. G. Blandford, 899 per cent.; R. Kromer, 889; J. T. Skelly, 879.

At the open tournament of the Delaware County Club, held at Manoa, Pa., Nov. 27, the six-man team match was of special interest. There were the Clearview, the Westchester, the Country Club teams, and the Florists' had teams Nos. 1 and 2. The Florists' No. 1 won with 127 out of a possible 150. There was a large attendance of shooters, and everything is auspicious for a successful future.

Nov. 28, at Ledgewood, N. J., a closely contested two-man team match took place between Messrs. Timmins and Hathaway on one side, and Mr. Smith and Dr. Vliet on the other, 25 live birds per man, $50 a side. The result was a tie on 40; and in the shoot-off at 7 birds they tied again on 12. Mr. T. W. Morfey acted as referee.

The Dover, N. J., Gun Club has made arrangements for an open Christmas Day live-bird shoot on the baseball grounds. A special feature will be a bull shoot. The contestants in this event shoot at a two-inch block, and the one who sticks a shot nearest the center of it wins the bull. The competition is open to all. The programme will be out in a few days.

Mr. Wm. Dutcher, of Paterson, N. J., writes us that the Jackson Park Gun Club will hold open live-bird shoots on Dec. 6 and 13, commencing at 12 sharp. Every one is welcome. Take Singac cars at City Hall direct to grounds. On Dec. 13 the return match between Bunn and Lenone, 25 birds, $25 a side will take place.

Mr. and Mrs. J. S. Fanning, of the Laflin & Rand Powder Co., will leave New York for California on Dec. 10, for a long visit with his parents and friends, whom he has not seen since 1899, the year in which he made his last visit. Mr. Fanning recently returned from a long trip of ten weeks, the greater part of which was made in Canada.

The six-man team contest between the Mechanicsburg and Cincinnati gun clubs, at Mechanicsburg, O., Nov. 25, was won by the former club, by a score of 457 to 437. Each man shot at 50 targets. Messrs. Gambell and Dreihs, of the Cincinnati team, scored 44 each, and were high men on their team.

The Poughkeepsie Gun Club will hold an inter-county shoot and tournament on New Year's Day. Six events will be shot off, including a 100-bird race, $10 entrance, open to the world. For further particulars address the captain, Max Condit, 296 Church street, Poughkeepsie, N. Y.

At the Thanksgiving Day shoot of the Bound Brook, N. J., Gun Club, Hooey won the first contest of a handicap series, the prize of which is a silver loving cup. Mr. W. Hooey shot as a scratch man. The club will hold its next shoot on Dec. 6.

Mr. H. S. Mitchell, of the Mitchell Manufacturing Company, London, O., after about a week's visit in New York, departed for his home on last Sunday. He, beside attending to important business matters, made many new friends.

BERNARD WATERS.

IN NEW JERSEY.

Smith and Vliet—Timmins and Hathaway.

Lakewood, N. J., Nov. 28.—To-day a closely contested two-man team match was shot between Mr. James Smith and Dr. Vliet, of Hackettstown, on the one side, against Messrs James Timmins and Steve Hathaway, of Morristown, on the other, 25 birds each, $50 a side. The team tied on 40, and in the shoot-off at 7 birds, tied again on 2. Mr. T. W. Morfey was referee. The scores:

Vliet	1220010210210001221120120—16
Smith	2202122112211212212212111—24—40
Timmins	2202200222222020202202222—18
Hathaway	2221021210111012222221111—22—40

Shoot-off at 7 birds:

Timmins	2222020—5	Vliet	1012222—6
Hathaway	2122121—7—12	Smith	2021122—6—12

North River Gun Club.

Edgewater, N. J.—There was a good shoot of the North River Gun Club on Nov. 29. There was a small attendance, owing to the fact that most of the boys were off quail shooting. The prize was won by Morrison, with Eickhoff a very close second. Morrison had just returned from a four-days' duck shoot, and probably that is why he killed straight. The only one that did not shoot up to his form was poor Cathcart, who explained that he had just been duck shooting, and the targets looked too small.

Shoot for trophy, 25 targets, $10 added money:

Eickhoff	1111111111111111110111111—24
Gillerlain	1011111101110111011111110—20
Vosselman	1101110011001111011101110—17
Morrison	1111111111111111111111111—25
Cathcart	1000000000010000000000000— 3

Sweepstakes, $1 entrance:

Targets:	10	25	25	15	10	10	10	10	10	25
Eickhoff	10	20	22	15	10	7	4	7	3	18
Vosselman	4	14	..	..	4	2	5	..	..	..
Gillerlain	..	18	19	11	..	0	4	..	..	8

Scales	..	..	..	..	1	..	..	..	..	..
Morrison	..	..	..	..	..	8	9	7	8	18

Morrison, 5 pairs, broke straight.

JAS. R. MERRILL, Sec'y.

Bound Brook Gun Club.

Bound Brook, N. J., Nov. 28.—The following is a record of yesterday's shoot of the Bound Brook Gun Club, which we shall be pleased to see in your esteemed paper. Mr. W. M. Hooey won the first shoot in a series of handicaps for the silver loving cup of the Bound Brook Gun Club at their grounds on Thanksgiving Day. The weather conditions were favorable for good shooting.

Target trophy, 50 targets, handicap allowance added:

	Hdcp.	Brk.	Total.		Hdcp.	Brk.	Total.
Hooey	0	43	43	Schenck	5	28	33
Anderson	0	38	38	Smith	10	23	33
Jackson	3	35	38	Brampton	8	21	29
Dr Bache	5	32	37	Dr Pardoe	5	20	25

In addition to this, a turkey and duck shoot added considerable sport. The next shoot will take place on Dec. 6.

DR. J. H. V. BACHE, Pres.

Carlstadt Gun Club.

Carlstadt, N. J., Nov. 27.—The Thanksgiving Day shoot of the Carlstadt Gun Club was well attended. Events 10 to 13 were high guns. The highest gun received a chicken. All ties were shot off, miss-and-out.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14

Trap at Singac.

Paterson, N. J., Nov. 29.—The invitation shoot held at Bunn's Hotel, Singac, on Thanksgiving Day, was quite a successful shoot. It brought together some of Paterson's best shooters, and a few from the outside. The competition was exciting throughout.

In the afternoon Bun furnished the very best of country birds, and had them in great shape.

Capt. A. W. Money spent the afternoon with the boys. He got away with the 15 birds, C. Morgan and Klotz missing their last bird. Morgan hit his hard with both charges, but couldn't stop it. Klotz's bird got away. The scores:

Events:	1	2	3	4	Events:	1	2	3	4
Birds:	5	15	7	7	Birds:	5	15	7	7
Lenone, 28	2	8	4	5	Powers, 28	5	..	..	..

Nov. 29.—In the match at Bunn's Hotel between Count Lenone and Arthur Bunn at 25 birds, $25, Lenone withdrew on the 18th round, as he could not win. Something wrong with his load. He hit them, but could not stop them. Scores will tell the rest:

Lenone, 28	000*02211010001*000w
Bunn, 28	222212*21222220011

East Side Gun Club.

Newark, N. J., Nov. 27.—The East Side Gun Club held a good shoot to-day on Smith Brothers' grounds. The club event at 20 birds resulted in a tie for first between Messrs. Koegel and Schortemeier. The first 10 birds of this were shot as a separate event for the Troisdorf medal, and the scores of it were as follows: Koegel 9, Hassenger 8, Schortemeier 9, Fessenden 8, Colquitt 9, and the guests made scores as follows: Pape 9, Duston 9, Hawes 7. The most wins by a contestant in ten shoots captures the medal. The club event had three moneys, divided by the Rose system. The scores:

H C Koegel, 29	212*2222212122211212—19
W Hassinger, 29	1201220112222121012—17

To Make an Old Gun Shoot Well.

[From Col. Peter Hawker's "Instructions to Young Shooters," 1838.]

THIS may be done if the barrel be of sufficient substance, of tolerably good iron, and perfectly sound, first by boring it* (as before mentioned), so as to have friction downward, and this gradually relieved forward; secondly, by putting in a chamber plug; and thirdly, by giving extra strength to the mainspring of the lock.

This recipe may not only be worth the observation of those who cannot afford a new gun, but useful to officers on service, who from not wishing to increase their baggage when constantly engaged, take no gun with them, and are perhaps after a summer's campaign stationed in winter quarters, where they have plenty of leisure and the finest shooting, though with no other fowling-piece than a regimental musket. This was the case on the old expedition to New Orleans in the country near which place the wild-fowl were innumerable.

A regimental armourer (even if he had the means) might not be perfectly master of the boring; and if he was, where on service would he get a lathe? But the perforated plug and the strengthening of the mainspring would very much accelerate the firing of a musket; and some of these barrels, if properly loaded, often make a very effectual substitute for a duck gun; and particularly if eased a little at the muzzle by the hard working of sandpaper. (This, by the way, would be very near the right bore for a detonator.)

The proper charge for them would be about two tobacco pipes full of powder, and the same measure of large shot; but, as this had better be regulated by the degree with which they are felt in firing, I shall lay down a rule, which, by the way (with a very trifling alteration, according to circumstances), may be applied to all duck guns, and most other guns, that are fired with a flint lock.

Load with powder and shot by equal measure in as large a quantity as can be fired with ease to the shoulder, putting your wadding strong on the former and light on the latter.

As this alteration is all inwardly, it cannot affect the appearance of the musket; and (omitting the boring) it would, if kept clean, be all the better for her Majesty's service. The perforation of the plug, however, should not be too small; and particularly in cases where it may become necessary to use it with cartridge powder.

Before concluding the observations on improving common guns, it may not be amiss to mention the following circumstances: An old fisherman in the country where I was residing had killed more wildfowl than any other man on the river, with a gun which he had picked up for thirty shillings. A few seasons previously to his death, he gave up shooting, and I bought this gun from the reported excellence of the barrel, which fully answered my expectations. Finding, however, that the plug and touch-hole were rather too much worn to be safe, I had them both replaced by the same country maker who put a new stock and lock. The barrel afterward shot so slow and weak that it was perfectly useless, on which I sent it to be altered by Mr. John Manton, who very civilly undertook the job; and by putting in a common touch-hole, made this gun shoot so admirably well that it was not till I had received five best finished duck guns from London that I could get one to equal it.

We are often laughed at for our expenditure in guns, when an old game-keeper will sometimes beat them all with a "piece" that has scarcely a choice, whether to prefer firing, or being fired at with it. I admit that if his barrel happens to be well bored, his mainspring strong, and his touch-hole and chamber plug well put in, there will perhaps be very little difference in the killing, between his "piece" and the best gun that ever came out of London. But if we consider that the excellence of a lock and soundness of a barrel, although not absolutely requisite in killing, are indispensably necessary for the safety of our persons; and that, although practice may bring a man to point accurately with a broomstick, yet we must allow the advantage, not to say the comfort and neatness, of having our guns turned out in a proper and workmanlike manner.

* In a stout barrel, even the deep flaws may be easily got rid of by means of making it red hot, and beating them in before you fresh bore it.

Mechanicsburg—Cincinnati.

MECHANICSBURG, Nov. 25.—The Mechanicsburg and Cincinnati gun clubs contested for the Phellis trophy, emblematic of the six-man team championship of the state, at the former club's grounds to-day. The Cincinnati team were beaten in a most decisive manner. Gambell and Dreihs were the only ones on the team to shoot up to their averages.

The conditions for high scores were bad, the weather being raw and cold, with a heavy wind blowing across the traps. Under the circumstances, the scores made by the winning team were very good. Mr. V. Phellis had the honor of making the high score, and under most unfavorable conditions, his gun giving him considerable trouble from the very commencement.

Mr. Harris Kirby refereed to the entire satisfaction of both teams. The scores:

Mechanicsburg Team—V. Phellis 45, Guy 44, Phil 43, Patrick 42, Shaul 42, Martin 40; total 457.

Cincinnati Team—Gambell 44, Dreihs 44, Coleman 40, Ahlers 38, Van Ness 36, Medico 35; total 437. ART.

At Brownsholme Hall, an old mansion in Lancashire, England, is shown a dog gauge, an ancient relic of the forest laws, consisting of a ring of a certain size through which every dog on the estate, except those belonging to the lord of the manor must be able to pass. This, of course, compelled the farmers and others, to possess only small-sized dogs, which could not injure the game.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Delaware County Country Club.

PHILADELPHIA, Pa., Nov. 27.—The Delaware County Country Club Gun Club, a new addition to the local trapshooting world, was fairly launched with an open tourney on their grounds at Manoa to-day. The tourney was well attended, but owing to the nature of the programme the squads were arranged in ragged order, leaving one of the two set of traps idle a portion of the time. The drawing features on the programme were an individual match at 100 targets over the magautrap, handicap rise, for a very handsome gold medal, open only to Philadelphia and vicinity, also a contest for the six-man team championship at 25 targets. The prizes in this event were a large silver cup for the winning club, and a small silver cup for each member of the winning team.

The shooting arrangements at the country club are the best to be had at a location where the grounds are very uneven, the background sloping away from the score very rapidly, making a target which ordinarily would be 12ft. high. look to be 30ft. high. Poor scores resulted in every instance. Neaf Apgar did manage to locate the targets in the last few sweeps, while A. H. Fox was simply up in the air. The trapping arrangements are a magautrap and a Sergeant system.

A very comfortable shooting box is in course of erection, and will be completed in the near future.

The individual match was shot over the magautrap, with thirteen entries, including Neaf Apgar, whose score did not count for the medal. C. Torpey, of Radnor, won with 81, practically beating out Van Loon in the last string. Five teams were entered in the team match, and the prizes were practically given to the Florists' before a gun was fired.

The tourney was managed by Howard George, assisted in the office by J. P. Edwards and J. S. Alcorn. The scores follow:

Individual championship:

Apgar, 20	23	22	21	18—84	De Treg, 15	19	21	18	18—76
Torpey, 17	19	18	20	24—81	Ford, 16	19	20	17	18—74

Event No. 5 was at 5 pairs.

Aquidneck Gun Club.

NEWPORT, R. I.—The Aquidneck Gun Club held its usual holiday shoot on Thanksgiving Day. Though a dense fog prevailed, and occasional showers added to the discomfort of the shooters, the boys did not murmur, but donned their heavy weather clothes and essayed to snuff out the clay saucers as though sunshine and bright skies prevailed.

A programme of 100 targets had been arranged, divided into eight events, and this proved to be long enough, for the traps balked frequently, owing to the general wetness, which also affected them.

The first four events were devoted to merchandise prizes, and the remainder to sweeps. Dring captured first honors, both in the prize events and in total score. Griffin landed second with 3 less.

Events:	1	2	3	4	5	6	7	8	Total
Targets:	10	15	10	15	10	15	10	15	Broke.
Dring	8	12	7	12	10	10	7	12	78
Griffin	9	11	5	11	6	13	9	11	75

J. S. COGGESHALL, Sec'y.

Winchester Gun Club.

DETROIT, Mich.—The regular shoot, Nov. 29, was a great day for ducks, but not for targets. There were sailers and dippers and fierce low lefts, even Joe Marks said they weren't easy. Guthard figured them best. Folowing are the scores:

Events:	1	2	3	4	5	6	7
Targets:	10	15	15	10	15	25	25
Brodie	8	..	11	..	11	20	15
Guthard	5	13	14	9	11	18	20
Ford	..	..	..	2	9	11	9

"MY AIR GUN."

My little girl, nearly seven, got off something that set me thinking. They all do, of course. At supper, just after attending the regular shoot, she with pride said to a little girl friend, "My papa has four guns—his bear gun, his air gun, his quail gun and his duck gun."

I mentally placed them all but the "air gun," and after thinking a moment, I asked her which was the "air gun," to which she immediately replied, "Why the one you take to the club."

D. A. H.

Ossining Gun Club.

OSSINING, N. Y.—The Thanksgiving Day shoot of the Ossining Gun Club shows up very well from an attendance standpoint. In all, twenty-nine shooters favored us with their presence. The Inter-county match was a sort of a fizzle, though the only team competing with the home team lifted the cup, and a beauty it is too. But four shooters came down from Poughkeepsie without their captain, Max Condit, too, and rather than have them go home disappointed, we shot them a four-man match, and right gamily they shot too. It was probably better that way, for now we can go up to Poughkeepsie and meet the Poughkeepsie boys again, it having been a pleasure this first time.

Mr. J. "Tecumseh" Skelly was the only trade representative present. Aside from being a fine shot with a gun, as well as with Roman candles, Mr. Skelly showed his versatility by juggling some cranberry sauce and the contents of a Vichy syphon among the scant locks of a hard-working fellow shooter. Such dexterity in shampooing could only come from long practice, or is it an outcropping of heredity? Perish the thought.

The first event was for the championship of Westchester county. A. Bedell, of the Ossining Gun Club, won the cup and title with 47 out of 50. Mr. E. F. Ball, also of the home club, and a new man at the traps, was a close second with 46.

The second cup put up by Mr. F. Brandreth for members who had never previously won a trophy, was won by R. Kromer, Jr. It was a popular win by a popular fellow. Mr. L. Goetter, of Brooklyn, is an all-right fellow, and always welcome. Mr. Davis, who came with him, is stamped the same way. As he is an old Mount Pleasant Academy man, he knows the way to Ossining, and will come again. Our old standby, Betti, was on hand, though a little out of practice. In fact, it was a good, jolly crowd, and there was no unpleasant episode to mar a successful day's sport. High averages for the day were as follows: A. Bedell, 90 per cent.; G. Grover and C. Blandford, 89 per cent.; R. Kromer, 88 per cent.; J. T. Skelly, 87 per cent.

Inter-county cup shoot, 25 targets:

Poughkeepsie Gun Club.		Ossining Gun Club.	
A Traver	24	A Bedell	22
P McCormack	20	A Ball	18
W Briggs	17	C Blandford	24

Ebbetts	5	9	10	11	7	..	..	..	6	..	1

Trap Around Reading.

READING, Pa., Nov. 28.—The holiday target shoot of the South End Gun Club, on its grounds, on Boyer's Island yesterday afternoon, was somewhat of a disappointment in the quality of the sport, the day being anything but favorable for making good averages. The occasional bursts of sunshine furnished the exception, when it was fairly good, the shooters being then able to find the targets about normally, but at other times the background was dark, making shooting a difficulty rather than a sport. When the conditions that beset the day are considered, the averages made were very good. The highest individual average of the afternoon was made by Gerhard, who broke 89 out of 110 targets shot at in sweepstake events.

Murphy had the best straight score made during the afternoon, 25 out of a possible 25. The magautrap was used part of the afternoon, but later the club's new Sergeant traps were pressed into service, and they gave entire satisfaction.

The scores made were as follows:

Sweepstate events, all at 10 targets each:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	1
Schultze	7	7	9	8	9	6	6	7	6	..	..	..	..

DUSTER.

Denver Gun Club.

DENVER, Colo., Nov. 24.—The Denver Gun Club enjoyed a pleasant outing on the 23d inst., at the grounds, south of this city. The occasion was a turkey shoot for Thanksgiving birds. The shooting was done in squads of six, each representing one turkey the ties being decided by lot. Capt. J. S. Sedam, who is just returned from an extended stay at the Utah duck preserves, came out best winner in the ties with three orders to his credit.

Some informal practice work followed, some at handicap distances, and doubles, the scores under these conditions being very good. Figures are subjoined:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	Broke

KILLMORE.

Tim, a well-known and popular "collecting dog" of Paddington station, is dead. About eleven years ago he arrived, a waif, by an early morning milk train, was adopted by an inspector, and soon made himself at home on the passenger platforms. He had a box attached to him in which travelers were wont at their will to drop coins, and Tim, though no parasite, had a knack of looking after first-class passengers, to many of whom he was introduced. With the late Queen Victoria he was a great favorite, and she always had a donation to give him, which was for the most part of gold. King Edward and Queen Alexandra likewise subscribed to the fund he collected, which was for the benefit of widows and orphans of persons who had worked for the Great Western Railway. The dog collected thousands of dollars.

PUBLISHERS' DEPARTMENT.

An important ruling in regard to what are known as "newspaper laws" has been made. These so-called laws provide that subscribers to newspapers are liable for the price thereof unless they give express notice to discontinue, or when they give notice to discontinue without paying arrearages, or when they refuse to take papers from the office, and that the publisher of a newspaper can have any one arrested for fraud who takes a paper and refuses to pay for it, and that it is an unlawful act to allow a subscription account to run on for six months or a year and a half and then tell the postmaster to mark it "refused" or send the editor a notice to discontinue the paper.

The post-office department has time and again informed parties making inquiries, and the public generally, that there are no such laws. The ruling now made is to the effect that a publisher who makes a demand for payment of the subscription price of his paper, through the mails, accompanied by a threat of enforcing such pretended laws in case the demand is not complied with, may be prosecuted for attempting to obtain money under false pretenses, provided he knows that such so-called laws have no existence as laws, or decisions of the courts.

The Lawrence-Roos Co.

IN FOREST AND STREAM of Oct. 25 and Nov. 1 appeared an advertisement headed "Hunting" and signed "The Lawrence-Roos Co., International Hotel, Sault Ste Marie, Ontario, P. C. Roos, Mgr." Inquiries made in Canada show that P. C. Roos has no connection whatever with any of the allied companies which operate the International Hotel. He is alleged by business people in Sault Ste Marie and by one of the banks there to be without known financial responsibility.

THE "REGENT."

A WONDERFUL NEW ENGLISH HAMMERLESS.

Price, $65.00 net, worth double.

The cut does not do justice to the gun, but we can guarantee them to be made by the best gunmaker in England and bored on the same principle that has won world wide honors for English guns.

The barrels are best Siemans Martin steel, and the shooting is unexcelled. The stocks are selected English walnut, latest model Anson and Deeley action, top automatic safety, nicely engraved, and finish and workmanship throughout up to the best English standard.

English guns have long been the standard of the world, and this new product will mark a new era in price as well as quality.

We have never before been able to offer so fine and good a gun for so little money. They can be supplied in weights from 6¼ lbs. to 8 lbs., in 12 bores, and from full choke to true cylinder.

We carry a large line of guns and rifles from $6.00 to $600.00, and are sole U. S. Agents for the celebrated W. W. Greener.

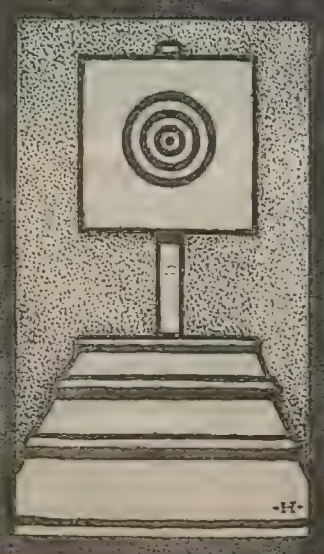
WINCHESTER CARTRIDGES SHOOT WHERE YOU HOLD



WINCHESTER

GREASELESS BULLET SMOKELESS POWDER CARTRIDGES.

THE severest kind of a test of the accuracy, cleanliness and general desirability of Winchester .22 Caliber Smokeless Powder cartridges loaded with Winchester Greaseless Bullets was made recently in San Antonio, Texas, by Adolph Toepperwein. Mr. Toepperwein, who held the World's Record for shooting flying targets with a rifle, having made a score of 979 hits out of 1,000 shots, undertook to better this record. He succeeded, making the remarkable score of 986 hits out of 1,000 shots, the targets being 2 1-2 inch clay discs thrown into the air by an assistant. Mr. Topperwein attributes his success in improving his previous record to the fact that the new Winchester Greaseless Bullet cartridges are so much cleaner than the lubricated bullet cartridges, which he used before. He says: "I am constantly using .22 caliber cartridges of Winchester make loaded with smokeless powder and the new Winchester Greaseless Bullet, and it is my belief that it is the best small caliber ammunition on the market. Its accuracy cannot be beat and I find the penetration equal to black powder loads and, if anything, greater, due probably to the hardness of the bullet. The ammunition works magnificently in any repeating rifle, and there is nothing to stick and gum the action. While shooting for the record last week, I shot in all 1,100 shots. During all this shooting, I did not clean the two rifles I used, nor did I find it necessary to cool them, although I shot quite rapidly. The barrels at the end of the 1,100 shots were as clean as though I had fired only 10 or 15 times. I am glad that you are pleased with my shooting, but it was only the result of using the best ammunition I assure you."

FOREST AND STREAM PUBLISHING CO.

CANOE CRUISING AND CAMPING.
By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.
This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.
Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

Samoa 'Uma

Where Life is Different.

By Llewella Pierce Churchill.

ANNOUNCEMENT.

Under the attractive title Samoa 'Uma, or "All Samoa," Mrs. Llewella Pierce Churchill has written a book for which she gathered the material during a residence at Apia, where her husband, William Churchill, was the American Consul-General. The conditions of life at the Consulate were most favorable for a study of the people, and with the instinct of a journalist Mrs. Churchill improved the opportunity to the full. As a woman she won confidences which would have been denied to a man, and acquired a vast fund of interesting lore which would have been withheld from one less sympathetic and less fully trusted. Thus she learned and has here described the real Samoa, that is the Samoans as they are.

The successive chapters give an admirably complete picture of a people in whom, as we read of them in these vivacious pages, Mrs. Churchill compels us to feel an unflagging interest. The book is well balanced; there is just enough of the history of Samoa to give an understanding of the events which have brought a portion of the islands under the flag of the United States; and just enough of description to make an appropriate and effective stage setting. But the chief characteristic of this brightly written book is action of incident and story. It is writing of the sort that has movement, and leads one on from page to page.

"Samoa 'Uma" is not exclusively about the Samoans; there is a chapter on Papalangi life, from which it appears that living in Samoa is so different; and some of the best things in the book are the personal experiences and adventures of this particular Papalangi woman, whose love of outdoor life led her on frequent excursions amid the coral reefs and into the dark jungles.

All in all, it is a book that will be read through, and read more than once. Here is the list of chapters:

CONTENTS:

I.—The Real Samoa.
II.—The Samoan Family.
III.—The Samoan Housewife.
IV.—Courtesy and Ceremonies.
V.—Kava—The Ceremonial Drink.
VI.—Music and the Siva Dance.
VII.—Handicraft and Art.
VIII.—Fishers and Sailors.
IX.—Shooting the Apolima Passage.
X.—The Weed that Catches Fish.
XI.—Torches on the Reef.
XII.—The Palolo Anniversary.
XIII.—The Chase of Rats.
XIV.—Things that Creep and Crawl.
XV.—The Wreck of the Schooner Lupe.
XVI.—Samoan Fickle Brides.
XVII.—The Vampires of the Tuasivi.
XVIII.—Beachcomber and Missionary.
XIX.—Copra and Trade.
XX.—Papalangi Life.
XXI.—The Story of Laulu's Hunt.
XXII.—The Great Vaiala Steeplechase.
XXIII.—Some South Sea Hoodoos.

ALERT.

This spirited engraving of the noblest game animal of Eastern North America was drawn for the FOREST AND STREAM by Carl Rungius, and has been reproduced as an artotype by E. Bierstadt in the full size of the original drawing. The plate is 12½ x 19 inches, on paper 22 x 28 inches. It is the most faithful and effective picture of the moose we have ever seen and makes a magnificent adornment when framed for hanging on the wall. Price (mailed in a tube, postpaid), $3.00.

THE SEASON'S DUCK SHOOTING.

THE recent cold snap offers us forewarning of the close of the duck shooting season in the North, and from this time on the gunner must look for his fowl in Southern waters—those wide arms of the sea or bodies of brackish, or fresh, water which from time immemorial have been the winter feeding grounds of the swarms of ducks, geese and swans, which rear their young in the far north.

We know little about the breeding of these fowl. For the most part their summer homes are far from the haunts of men, and there are few opportunities to observe them or to learn anything about their annual increase. As it happens, we do know that in western Montana, close to the mountains, and northward into the Province of Alberta, Canada, very few young ducks were bred during the past summer. Spring opened late, and the summer was consistently cold, with continuous rains, so that in many cases the water covered the prairies and drowned out the nests of eggs on which the birds were sitting. This observation, however, covers but a small section and affords no hint as to how the wild fowl may have succeeded in rearing their young in other quarters.

So far, the duck shooting has been generally good. Reports from the Middle West show the flight to have been a large one. The mild weather caused it to be late in coming, but after a few hard frosts the birds came in well, and the usual lakes, marshes and club grounds furnished shooting quite as good as is commonly had.

Along the Atlantic coast, the shooting has been better than usual. Broadbills and redheads have been abundant in the Great South Bay, and some extraordinary bags have been made. Thus, notwithstanding a century of persistent gunning, Long Island still retains its fame as a duck shooting resort, and it will probably hold that eminence for generations of gunners yet to come.

Passing southward to Chesapeake Bay, we learn that in many localities the shooting has been better than it usually is. On Spesutia Island—once a great resort for canvasbacks—blackheads and occasionally redheads offer shooting good enough to satisfy the most greedy gunner. And while the Chesapeake waters do not furnish such vast numbers of ducks as used to be killed there twenty-five or thirty years ago, the aggregate number taken by the increased number of shooters is very great.

Still further to the southward come the great broad waters lying along the coasts of Virginia and the two Carolinas, where the birds are said to be found this year in unusual numbers. During much of the time since the shooting season opened, the weather has been so warm as to make sitting in the blind uncomfortable, and it has been impossible to use any considerable number of ducks which might be killed. Nevertheless, many birds have been killed, of ducks, geese and swans, and as the weather grows colder and more tempestuous, there will be great shooting. It is said that in Currituck Sound there are already many canvasbacks and redheads. Further south, even in Core Sound, canvasbacks have made their appearance in numbers. On the other hand, we are told that at City Point, Va., there are now no ducks because of the mild weather.

It is never easy to forecast the results of a duck shooting season. Even though the birds be plenty, weather conditions may make the season a failure, or, again, when the ducks are relatively few, the proper weather may result in bags which are very satisfactory to the sportsman.

A good season of duck shooting leads the superficial observer to think and say that the ducks are as plenty now as they ever were, but this is not true. In view of the constantly increasing number of gunners, and the general settling up of the country, north and south, and east and west, it is inevitable that the birds should grow scarcer year by year, and it is the part of wisdom for gunners generally to consider what measures should be taken to offset, in some degree, the slaughter which takes place each year. Wild fowl being what they are, it seems evident that the only remedy is to kill each year a less number of birds, until the number killed shall be smaller than the annual increase. When this happens the fowl will begin slowly to grow more abundant. To lessen the number of birds annually killed, means to shorten the season, as has been done in the case of certain game birds in several States; and to this shortening of the season might well be added a limit of the bag, so that no man should kill more than a certain number of birds, which number should be established by statute. It is only by measures such as these that the decrease of our wild fowl can be arrested.

THE MAN KILLING.

RECENT associated press dispatches recount that fourteen people were killed and twenty-one injured more or less seriously in Michigan by hunters since the commencement of the open game season in that State this year. This is an appalling list of calamities, more suggestive of war than of the peaceful and beneficent sport of field and forest. It is a deplorable condition of hunting, all the more deplorable since it is not due to any inherent dangers in the sport.

Most of the so-called accidents from the use of rifle and shotgun are the result of criminal carelessness on the part of the users. They have their origin in the erroneous judgment of the man who mistakes his fellow man for a deer, or who uses a high-power rifle in a settled community regardless of the perils he imposes on its dwellers. They are unjustifiable.

Though commonly considered and dealt with as an accidental happening, the shooting of man on the assumption that he is a deer is not an accident at all. Such is criminal carelessness in its most culpable form. The dangers of such shooting are a matter of common knowledge. The past years have had their long lists of deaths and maimings caused by reckless hunters. The dangers of shooting at a body first and investigating whether it is man or deer afterward, or of using in a settled community a rifle having a range of two miles or more when one of two hundred yards would be sufficient, are dominant themes every year in the open season. No one can truthfully plead ignorance of them.

After killing a man in the common woods manner, it is absurdly weak to plead that the man was mistaken for a deer. There is no resemblance whatever between them. Even in the woods, the distinctive features of man and deer are easily distinguishable. If the hunter in the woods can perceive a body of some kind moving, but cannot definitely determine to what class of animals it belongs, it is quite as easy for him to think that such animal is a man as to think that it is a deer. In any event, under the dangerous hunting conditions which obtain at present, the hunter has no justification for shooting until he absolutely knows what kind of animal he is shooting at, or at least that he is not shooting at a man. The fact that the hunter shoots a man is, unconditionally, an act of criminal carelessness. If he did not know, he should have investigated till he did know. Suppose it was really a deer and escaped in consequence of the delay. Let it escape then. The lives of men are not to be jeopardized because a hunter dislikes to risk the loss of a deer.

The fact of the matter is that so many killings and woundings give just grounds for suspicion that some of them are perpetrated maliciously and intentionally. There are men of cruel natures who take pleasure in killing anything, even their fellow men. This perverted craving for bloodshed finds expression in various forms. In the great cities, not infrequently some murderous individual creates a reign of terror by murdering and mutilating many people. It is a well-known fact that farmers are insistent in the claim that their live stock is shot in utter wantonness. It has been stated as a fact that a sportsman in Maine asking his guide to take him into another section of the woods in a hunt for big game, the guide refused emphatically on the ground that if so and so caught him in that section, so and so would mistake him for a deer and kill him. The safety with which life could be taken maliciously under the plea of mistake was thus clearly apparent. It is a belief in India that many of the deaths attributed to tigers are really caused by men.

In any case, deaths or maimings due to criminally careless acts, should come within the cognizance of the law. Men guilty of manslaughter should be punished for manslaughter. The profound sorrow of the offender does not in the least condone or excuse the act. The plea that he did not know really aggravates the offense. There was a dominant obligation that he should have known that he was not firing at a man. Once put the offender's liberty in jeopardy, or his life if the shooting is done maliciously, and there will be a great slump in the number of so-called accidents incident at present to deer shooting. With the penitentiary as an alternative for criminally careless shooting, men who are reckless now will be imbued with caution for their own personal interest. The value of one life is far in excess of the sum total of all men's pleasure, and it should be properly safeguarded by law, when the ordinary human considerations of mankind have yearly been shown to be wholly inadequate.

Montana taxidermists advertise buffalo specimens and heads at prices which run from $100 for a "Rocky Mountain bison calf specimen," to $375 for a "Rocky Mountain buffalo bull specimen," and from $125 to $500 for heads. These quotations go to show the profitable character of buffalo farming, and explain also the eagerness rooted in cupidity with which poachers harry the remnants of the race now roaming in a wild state. The existence of certain semi-domesticated buffalo herds serves as a cloak to cover the traffic in illegally killed wild buffalo—for there is no place in the country where the wild ones may lawfully be taken. Just so long as the hunter can get a round price for buffalo heads he will seek them. The only way to put a stop to buffalo poaching is to prevent its rewards, by stopping entirely the transportation and the sale of wild buffalo heads. The sale of heads of animals raised in domestication may very properly be permitted, each head so sold being duly certificated to show it origin. But to endeavor to preserve the wild buffalo, while at the same time allowing taxidermists to make merchandise of their heads is the sheerest absurdity. Stop the sale of wild buffalo heads.

Notice has recently been received at the Lewistown Land Office in Idaho of the temporary withdrawal from settlement of 2,300,000 acres lying south of the present Bitter Root Forest Reserve, in the counties of Idaho and Boise. An investigation is to be made as to the advisability of adding this territory to the reservation. Should such an addition be made, the Bitter Root Forest Reserve will have an area of 5,300,000 acres—about equal to the State of Massachusetts. The land temporarily withdrawn lies along the Salmon River watershed and includes several mining districts.

The question of the pollution of streams by coal mine refuse is soon to be investigated in Pennsylvania by the Division of Hydrography of the U. S. Geological Survey. It is a matter of common observation that streams running through the anthracite districts of eastern Pennsylvania, and other mining localities, are often heavily charged with sulphur. The mine refuse which comes from the washeries carries with it much fine coal dust in suspension, so that for some distance below the outlets of these washeries the streams look like liquid stove polish. The fine coal dust carried long distances down the stream is gradually deposited and tends to fill up the stream. Water so polluted destroys or drives away all varieties of fish, is unfit for use in the household or in the manufactories, and the process of filtering it is extremely difficult. An important part of this investigation will be to learn what effect the sulphur-charged streams may have on the processes of decomposition of organic matter, which is taking place in the rivers.

The most important measure that came up for discussion by the New York League last week was the abolition of the sale of woodcock and ruffed grouse killed within the State. Such a law is absolutely essential to any efficient protection of these birds. With an open market the grouse snarers and market shooters will kill for sale; an open market means continuous traffic. That is an axiom. The only way New York can save its most valuable game birds is to stop the sale of them. It will be something better than present conditions if the proposed law shall be put into operation to forbid the sale of birds killed within the State, but the only actually sufficient system will be one which prohibits traffic in the birds altogether, without any distinction as to their origin,

The Sportsman Tourist.

Reminiscences of an Octogenarian.

Part II.

BY THE OLD ANGLER.

(*Continued from page 432.*)

But, to return from this long digression, let the writer relate the incident which will always connect itself with his memories of Dee Side Farm and the Restigouche. On arriving at the log camp which, with the squatter's cabin near by, were the only signs of civilization then existing on the upper waters of the river, he saw a bell tent and an upturned canoe on the shore, and an Indian cooking a savory-smelling meal. A tall, elderly gentleman, seated in a camp chair, was playing a flute, while waiting for the meal to be served. Mowat introduced him as a member of the club who had his own notions about sport, and sought it in his own way, as far from the club house as he could get. By Mowat's advice he had been camped here for several days, but he intended going some distance up Patapedia before he left the river. The writer had, some fifteen years previously, fished the Southwest Miramichi with this gentleman's cousin, whose report of New Brunswick as a field for sport had induced him to become a member of the Restigouche Club. He invited us to join him at table, where, for the first time, the Old Angler tasted "head rice" cooked as it is only in the Southern States.

Many old anglers will remember Wm. Neill Habersham, of Savannah, Ga. When we first met he must have been approaching his sixtieth year. Tall, straight, thin, but wiry, he was then active and vigorous, and on occasion could handle a paddle well. With strangers, he was distant but courteous; a fine type of the Southern gentleman befo' de wah. With his associates he was an intelligent, well-read, affable and genial *bon camarade*. All his prejudices and sympathies were Southern, and as he had lost two sons in the Civil War, his feelings toward the North were no doubt embittered; but he seldom gave them expression. His greatest hobby was music; he was an enthusiastic admirer of Wagner's compositions, which were at that time coming more and more in favor with the musical world. He played several instruments, of which his favorite was the violin; but only a very elaborate and highly finished flute accompanied him to the woods and streams. His cigars were a revelation. He evinced much enjoyment of a bottle of French brandy, one of the only two in the writer's gripsack, which the well-known importer of that day, Thomas Furlong, had lately received from Marseilles, where he had selected it himself on his preceding visit to the vineyards of France. Hundreds of readers of Forest and Stream who have enjoyed the pure wines, brandies and whiskies in the old days dispensed at Furlong's wine cellars, will be pleased to read that he is still hale and hearty, enjoying his advancing years among his books and pictures, among which last are fine reproductions of those great originals, "The Rise," "The Leap" and "The Last Struggle" of America's foremost painter, in whose studio, when at 41 Tremont street, Boston, the writer has spent many happy hours discussing rods, lines, reels and flies; for beside being a great artist with his brush, he has few equals with rod and line.

At Mowat's request Mr. Habersham played several pieces on his flute, which were Sanscrit and Greek to us both, but which he assured us were typical of the music of the future, but at that time was appreciated only by the best cultivated ears. As it was quite beyond our appreciation, Mowat asked him to play some familiar tune, the music of which was within our mental grasp, and suggested "Yankee Doodle" or the "Star-Spangled Banner." Imagine, if you can, a Southern gentleman of the *ancien régime* voluntarily playing the Northern hymn of triumph! I can see now the expression of pain and disgust that distorted the features of our kindly host, as he seemed about to speak; but rising, retreated to his tent and we saw him no more until next day.

Whether it was that the classical music which neither of us could appreciate, reminded Mowat of something he could grasp, or that he was annoyed at himself for having aroused painful memories in our friend, he began humming so hilarious a lilt in French that I wished to hear both tune and words. The two half-breeds caught the familiar notes and at once joined in the exciting *diablerie*, and for the first time the writer heard the old French chanson, *"En roulant ma boule."* The words of the song have no connection with the chorus; they consist of some twelve distichs, which tell in a rambling manner of a prince going hunting and shooting a snow-white drake, whose death is described and whose feathers eventually form a soldier's bed. They seem a mere frame on which to hang th rollicking chorus which sets Frenchmen frantic with joyous excitement. I have now before me the notebook in which are the words of the first verse and the much-repeated chorus, which are as follows:

"Derrier chez nous, ya-t-un étang,
En roulant ma boule,
Trois beaux canards s'en vont baignant
En roulant ma boule,
Roli roulant, ma boule roulant;
En roulant ma boule roulant,
Roli roulant ma boule."

The writer has often since heard it sung, but never more hilariously than in the Canadian House of Commons, where it is one of the many modes of obstruction when killing time is the object. Whoever has seen the boyish delight with which grave and reverend seigneurs join in this ridiculous lilt will not wonder that it is so popular with all Canadians—old and young, high and low. Wherever a dozen French-Canadians are assembled, no matter what the occasion, some one is sure to start *En roulant* before they part. There seems to be something uncanny in the very sound of the words, as there is in that now forgotten song which used to set Irishmen crazy with excitement, the chorus of which is just as senseless:

"Lero, lero, lilliburlero,
Lilliburlero, bullen a la."

Bishop Burnet tells us; "the army and the people, both in city and country, were singing it perpetually, and perhaps never had so slight a thing so great an effect." But probably the good Bishop never heard *"roli roulant ma boule"* sung by Frenchmen.

Mr. Habersham was an artist with rod and line. His fly-book was a sight to gladden the heart of an angler. He had all the standard flies tied to his order in London on double hooks of very small size; and his casts and leaders were of the best gut that money could buy. With these, a split bamboo rod in three pieces, two spare middle joints and three extra tips, with eighty-five yards of American plaited waterproofed line on a plain reel, he would take a salmon where the general angler would swear by Father Izaak no salmon would lie. The brightest sun did not deter him; he would often raise and hook his fish in the full glare of midday. Of this he was very proud, and entered in his notebook all the incidents of each victory. He had wonderful patience. I think he exasperated the fish until they rose to take vengeance on the persistent little insect that challenged them to the chase. Day after day he would return to camp, from up or down the river, seldom without a fine fish. Sometimes two, and on one memorable occasion, no fewer than four rewarded his patience and skill, and the good old gentleman was more pleased than a child with a new toy. Few anglers, I venture to say, better enjoyed the sport or found more unadulterated pleasure in its pursuit, than the quiet Southern gentleman who, until his death some years ago, annually fished Indian House and Patapedia. Fine angler as he was, he had one very bad habit, acquired in catching catfish in Southern rivers, in which, I fear, he persisted to the end. He would, when excited, recover line by drawing it through the rings by hand, allowing the slack to form confused coils at his feet. He knew perfectly how unscientific it was, and how it really increased the chances of losing his fish, by himself losing control of the arch of his rod, which control, with proper management, lies at the foundation of salmon angling as an art. Casting a long line is a matter of mere practice with a good rod, and is, after all, a matter of no great importance, except under unusual circumstances. Making flies fall lightly on the water is a useless, fanciful accomplishment, not worth the trouble of acquiring. Every angler of much experience will recall how, nine times out of ten, he has raised his trout or salmon on the clumsiest casts, which he thought disgraceful, but about which the fish evidently held a different opinion. He will also recall with a smile how often he has missed hooking his quarry, because he was more intent about the *manner* of his cast than about his *object*. Once in a while the ability to cast a long line will reward the artist with a rise he would not get with a short cast. But every angler who has had experience with *Salmo salar*, Ouananiche or *Fontinalis*, will remember how much more his success in raising them depended on the day, the wind, the state of the water, but above all, the humor of the fish, than upon his own skill. How often has the Old Angler seen the small boy with his wattle and ten yards of twine, splash out his bait and "strong in" his two-pound trout, while the said angler, with his split bamboo, his silver-plated "multiplier" or "automatic action" governed by the little finger, his hundred-dollar fly-book with spoons on swivels and carefully imitated grasshoppers, beetles and young mice, has left the lake with a heavy heart and a light basket!

The last day of our stay at Indian House had come. I was anxious to take home a fresh salmon, so after breakfast repaired to the head of the pool, Mr. H. kindly going to the mouth of Patapedia, leaving the whole pool to my single rod. This rod, by the way, was a good specimen of the almost forgotten "Castle Connell." It was fifteen feet long, the butt of Irish ash, the second joint of lancewood with greenhart tip, so cunningly proportioned and graduated that, while the tip was sensitive as a nerve, it was strong enough to act in concert with the lancewood and ash. These two pieces were joined by splicing a long scarf with waxed thread, which left the wood at its strongest, and the play of the arch free from the irregularities caused by ferrules, no matter how deftly these are fitted. A plain reel with eigthy yards of line set into the butt about eighteen inches from the "spear" completed the plainest, the cheapest and the best rod I ever handled. I admire, as every angler must, the beautiful split bamboo, with its fine fittings, and there is no denying its excellent qualities when a heavy fish is on the hook. But I must say that I never yet played a heavy salmon on one that I did not wish for my old shabby-looking "Castle Connell," sent me by an angling friend who had often tested its virtues with the heavy fish of famous Blackwater in Ireland. In passing, let me say that a friend sent me lately a clipping from the Chicago Field, in which was described, at some length, as the recent invention of a Western angler, the spear, which was common on salmon and trout rods made in England more than a century ago. The bags in which these were packed for sale always had a pocket to hold the spear, which screwed into the brass cap on the butt. How strange it seems that such simplicity can yet exist among American anglers! But that the editor of a paper devoted to fishing and shooting should print such a paragraph, is passing strange indeed.

But to return from this digression into which modern rods and modern inventions all unknown to Dame Berners and Father Izaak have tempted the Old Angler. The river was high for the season and quite a ripple ran over the shallows at the head of the pool. Beginning well up, I commenced careful fishing, casting the fly fairly for half an hour without a rise. I then reluctantly resorted to the style of fishing which is always more or less successful at Indian House—allowing the fly to sink and playing it as a bait. In the course of an hour's fishing—not angling—I had hooked and lost two fish, simply because I had not, at that time, quite overcome the impulse to strike when a fish took the submerged fly. The third one hooked itself while I was carelessly talking to Mowat over my shoulder, as he sat in the stern and managed the canoe. This fish gave good sport and took off most of the eighty yards on the reel, which compelled following in the canoe to the lower end of the pool before his rush could be checked. He never showed himself nor broke water from the time he was hooked until Mowat had the gaff in his side. But for strength and dogged fight, without much activity, he was equal to the best of his confreres. Commencing again at the head of the pool, another hour's fishing drew a blank, and as dinner time was approaching, I was about willing to "let it go at that"; but the camp was some distance below the pool, and Mowat urged me to put on a Jock-Scott—the only one I had left—and fish down to camp. Noticing the leader was somewhat chafed, I replaced it by a new one, and with my last Jock commenced careful casting, as this fly will bring them to surface if any will. A little below the head of the pool at that time was a large rock or boulder, which has since been carried by ice nearly to the foot. Mowat approached this rock with care from the shore side, for he knew that there lay about the last chance we had for another fish at Indian House. Carefully casting toward the rock, I soon had a splendid rise, the swirl of which indicated a large fish. Had I not then acted instinctively and made that indescribable turn of the wrist which every angler knows perhaps as well as the writer, I should have lost the biggest fish I ever hooked and captured in a long fishing experience, which covers sixty-five years on river, lake and stream, to say nothing of missing the strangest complication into which a leader ever got since Dame Julyana Berners and Father Izaak Walton commenced "fisshinge with an angle." The first rush took off sixty yards of line, and at the end of it a splendid leap showed the dimensions of what looked about twice the size of any salmon I had ever seen. This made me more anxious to secure him, and this very anxiety caused a nervousness that I know augured very badly for success. Remembering he was at the end of a new and unworn leader, and knowing the strength of both line and rod, I soon felt confidence and coolness return. After leaping he turned and rushed toward the canoe at a rate quite beyond the capacity of the reel to recover line. Had I known that in the prolific womb of the future lay hidden an automatic self-acting reel that could be manipulated with the little finger, I am sure I should have prayed for one, but in the absence of knowledge of any better reel than my own—which I am sure a multiplier is not—I did "all I knew how," and really I do not know what that was at the time. All I do know is that I soon felt the sway of the fish on the perfect arch of the rod, which I could vary by raising or lowering the butt, according to the strain on the line. When near the canoe he again turned and made a downward rush; but never again did I get sight of him until he came, motionless and almost lifeless, to the shore on which I had landed. His rush was not far, checked as it was by as quick an arch as I dared use. On trying to reel in, the feel of the thing told me the fish was hooked foul, and again nervousness almost lost the prize. The writer's experience has been that four out of every five fish hooked foul escape, in spite of the utmost care and skill; the hook almost always enlarges the hole and works out. Knowing this from long experience, I also knew that the sooner he was brought to gaff the better. There were risks all round. The longer he was in the water the more *my* chances decreased; the more strain put on him to bring him in the more *his* chances increased, and I fully realized the force of the common expression, "between the devil and the deep sea," which fits with great aptness every tight place. However, I recalled a solid chunk of wisdom handed down from antiquity—most likely from Socrates when he lost a big fish in the Piræus—to the effect that while man cannot command success, he can do better—he can deserve it; so I set about deserving success by doing all I could in putting what skill I could against the wonderful strength that fish displayed. I concluded to take all the risks involved in attempting a speedy capture, in preference to those a longer fight entailed. Acting on this decision, I put on all the strain that rod and line would bear, and it was real sport to see the arch of that rod change as the erratic movements of the fish rendered necessary, knowing that every change had its peculiar risks. Could an angler only know where a fish is hooked and how strong the hold is, he would know just how to handle him. But in utter ignorance of this and with the scantiest data on which to form an opinion, he is always acting in the dark. Perhaps what he thinks most artistic work is the worst possible for his chances and the best possible for the captive. It is this uncertainty which gives to angling the peculiar excitement that, so far as the writer knows, no other sport affords.

Despite all the strain I dared exert, that fish bored his way wherever his erratic fancies led him. His rushes were short and sluggish, and each successive one convinced me that his movement rather than his strength was interfered with. I had, in my time, struck and played, lost and secured, many foul-hooked fish, and had a good general knowledge of their action; but this fellow "knocked higher'n a kite" all my knowledge, skill and experience. He was not only the strongest I had ever felt, but his peculiar action puzzled me exceedingly, and curiosity to know how he was hooked added to my other sources of excitement; but I was literally helpless. All I could do was to give him a wide arch to waste his strength on. Several times Mowat suggested that he should set me on shore, but I knew that my best chance was with the fish in deep water. Beside, I could not, with any prudent strain, get him out of that deep water had I wished it. For more than an hour I could only oppose the arch of the rod against the sullen strength of the captive. To the surprise of both Mowat and myself he had, for a long time, ceased to rush. He kept in the deepest water and simply moved straight ahead with such strength that, when I feared the leader must part, I was forced to give him line to ease the strain. I pointed out his peculiar action to Mr. H., who had now returned, and ventured the opinion that he was hooked very near the tail, which prevented its free use. In this opinion Mowat agreed, and had the fish been lost, we should both have felt satisfied that the hold, very near the tail, had given out from the long-continued strain. After having spent two long hours in efforts to save the fish, and feeling fatigued and much cramped from long standing in the canoe, I was forced to land and stretch my wearied legs. Here, I fear, I grew reckless, for Mowat more than once cautioned me that the strain on the tackle was beyond prudence; but slowly I began to recover line, every inch by sheer force on the reel. Forty yards were out, of which I had not recovered a yard that I was not forced to relinquish later to save leader or rod. To my intense satisfaction, he came slowly in as the reel took up turn after turn of the line. Evidently the captive was tired out, for his strength failed fast, and he came in with

lessening strain. I asked Mowat to get the gaff into him at the earliest moment possible, and to make no blunder doing it. He gave me an indignant look that spoke a volume, and waded in thigh deep, waiting for the fish to be reeled within reach. When he did get sight of him, he stepped toward the shore and said, coolly, "Reel up, reel up!" With a mental anathema at what I thought his obstinacy, I obeyed his gesture rather than his voice, and cautiously reeled the fish into more shallow water, mentally blessing Mowat for not gaffing it. Again came that gesture and again "Reel up!" I did so, but I am afraid the atmosphere was blue with "cuss words." What I more distinctly remember—and the whole picture is before my mental vision as I write—is seeing Mowat stoop, reach out an arm, seize the tail and walk to shore with a fish so large that even in his strong hand its head and shoulders dragged on the sand. When its feeble struggles were ended by a blow on the head and the fish laid on the grass, the whole mystery was solved—the fish was fast by the tail, but not hooked there. Incredible, nay, almost impossible, as it seems, the hook was deep in the angle of the left side of the mouth; thence the line had crossed through the mouth to the right side, gone straight down that side, took two plain turns around the peduncle of the caudal fin, and then two perfect half-hitches—as perfect as if human hands had placed them. I now saw Mowat's reason for wishing to secure the fish without using the gaff. He dimly saw the line round the tail and feared the struggles which would surely follow the stroke of the gaff would disarrange it, and he was curious to see the enigma explained. The first two turns had quite buried themselves in the skin, and the two half-hitches had made a deep groove round the peduncle close to the junction of the tail. I had seen many curious complications of lines and leaders, but this surpassed all that any of us had ever before witnessed. No doubt the compress around the tail had paralyzed that organ and rendered it incapable of further action. I cut the leader two feet from the hitches and had it packed with the fish to show angling friends in St. John. Of some six or eight good anglers and *bon camarades* who saw this strange tangle, the writer alone still "lags superfluous on the stage." The fish weighed thirty-nine pounds; when fresh run from the sea, it would doubtless have been two or three pounds heavier. Mowat packed it in grass and fern, bound with twisted withes until it made a mummy almost as large as himself. We started at once for Metapedia, arriving there in time to meet the Quebec express, and next morning the writer was in St. John to resume the less pleasant duties of official life.

* * * * * *

There must be some witchcraft about lost fish! They are always the gamest and the largest, and by some mysterious process they increase in size every time the story is told! If they merely rise and are not hooked they are always big fish! If hooked and lost, they are "whoppers"; but if the captive has made a fine leap and escaped, he at once assumes marvelous proportions, and the grieving fisherman grows pathetic in describing every minutia of his rising, his leap, his rushes and his final escape, which, strange to say, is always attributed to being very sligthly hooked! Once in a while a frayed casting line or leader, a knot slipping or a fly drawing from the gut gets the blame, but whoever heard an angler so much as hint that any fault of his own caused the loss on his monster fish! After all, half the plasures of life arise from being cajoled, and happy is the angler who can cajole himself and get his listeners to thrill with sympathy when fighting his battles o'er again.

But the Old Angler is shelved. Only in memory can he now cast a line or play a fish. No doubt he would cut a poor figure with his shabby old "Castle Connell" beside the *jeunesse dorée* of the present day, with all the beautiful and expensive tackle that American ingenuity and mechanical skill have evolved; though I doubt if Father Izaak would know what to do with it. I also doubt whether the present day angler "with all appliances and means to boot" can knot a more reliable leader, put up a more killing fly or handle a rod any better than the grizzled members of the Old Guard with whom the Octogenarian has fished. Among these he would mention as *facile princeps* Walter M. Brackett, of Boston, who has given to art lovers the three greatest fish pictures in America; Charles Hallock, who founded and for years edited FOREST AND STREAM, still the leading sportsman's paper in the United States, to whose zealous and persevering efforts the devotees of true sport are more indebted than to any other man now living, who, the writer is glad to learn, is yet active as ever in the pursuit of sport and Natural History; dear old Thad. Norris, whose too early death was a loss to fishculture and true angling; Joseph Jefferson, the renowned and accomplished actor, whose unrivalled impersonations have added to the gaiety of nations; Nathan Cummings, of Portland, who did more than any other man to draw the attention of scientists and anglers to the "landlocked salmon" of Sebago and Schoodic lakes; Commissioner Stillwell, of Maine, who did so much for the protection of salmon in those two noble border rivers, the Penobscot and St. Croix; and many other true sportsmen less known to fame, who were the *avant couriers* of "fisshinge with an angle" in the United States. In the Maritime Provinces of Canada, the Octogenarian is the sole survivor of the Old Guard, among whom he knew Sir Edmund Head and Sir Arthur Gordon; M. H. Perley and A. L. Light, Robert Tannahill and Tom Trafton, Dick Calvert and Sandy Wood, all of whom have crossed the bourne to the happy hunting grounds of the hereafter.

Dr. Langstroth, the best taxidermist; Joe Dalzell, the best rod maker, and Tom Willis, the best fly-dresser in Canada, though all on the down hill of life, are still hale and vigorous. Each is an artist with rod and gun, and can yet show deftness on lake and stream and unerring aim in the forest. For fin, fur and feather, no more thorough sportsmen has the Old Angler met, and none more worthily represent the Old Guard or more religiously follow its high precepts.

The man who can select the best gut, securely knot his own leaders, put up a decent fly when confined to camp, cast a fair line, perform the magic turn of the wrist when his fish rises, manage on scientific principles easily understood, a moving arch on his rod, so that an easy strain on the fish is always maintained, never for a moment allowing a yard of slack line, and can maintain this under constantly changing conditions, until the gaff is in his salmon or the net under his trout, has little more to learn. He is fully qualified to enter the arcanum of the angler and enjoy pleasures that only the angler knows. And yet, alas! the great majority of these good fellows—sportsmen in the rough—who go a-fishing, are only fishermen! But all honor to the guild, the craft, the brotherhood by whatever name they are called! A good fisherman cannot be a bad man! A good angler is the highest development the *genus homo* has yet reached, and however the race may yet progress, among the highest and best, and holding the formost places, will still be found the anglers!

V.

Theo. Louis, Trader.

MANY of our readers were interested in the note, from the pen of Mr. Theo. Louis, recently published in FOREST AND STREAM, telling that he recalled one of the men whose name is engraved on the old stone, dated 1849, recently figured in FOREST AND STREAM.

Mr. Louis was born in Duisburg, on the Rhine, in the year 1829. He took part, under General Franz Sigel, in the Revolution of 1848, in Germany, and was obliged to fly his native land. He came to America and went West, direct to Wisconsin.

In 1852 he engaged to accompany Prince Nicholas of Nassau, on a trip to the West. The party left St. Louis on the steamboat Robert Campbell during the June freshet, and went up the Missouri River. The vessel steamed during the day and tied up to the bank at night. Crew and passengers chopped their own wood, and supplied meat with their own rifles. The vessel belonged to the American Fur Co., and took up the river men for the different forts and merchandise for the Indian trade. There were a few luxuries, such as coffee, rice and sugar, but for the rest the white men, like the Indians, subsisted on wild meat—buffalo fresh and buffalo dried.

The trip up the river to Fort Union occupied six weeks. Mr. Louis went with the Prince's party up the Yellowstone, and then back to Fort Pierre, and there taking horses, went west by way of White River, through the bad lands toward the Black Hills, to Ft. Laramie. At this point he left the Prince, and engaged to Captain Gratiot, of old Fort John, which was situated near the Platte River, not far from Scott's Bluff and Chimney Rock. At this post he was stationed until 1855, traveling about over the plains, trading with the different tribes of Indians and chiefly in company with his friends, Antoine Le Duc and George Lamont. At the post were such old mountaineers as Billy Adams, Rulo, who had had part of his feet frozen off, Carifeld and Tom Shaw.

During these journeys Mr. Louis kept memoranda of the events of his journeys, but on his return to St. Louis these were destroyed by fire.

A little later he married and settled in Wisconsin, striving to make a farm out of a wilderness. He still retains a few momentoes of his life as a trader, and we may imagine that he often looks back with longing to the free days of fifty years ago. He is now a successful farmer and breeder of live stock in Wisconsin, and his later life is smooth and happy.

Zenaida.

THIS name was suggested by the Zenaida dove, and although too far north for this variety, still their cousins, *Zenaidura macroura*, haunt the place all summer long and nest in the glade made by the little stream which makes the eastern boundary of the farm. If I could have a country place for the asking, I would surely convey to my Macaenas in some way that he put a stream on one border at least, where cardinals could bathe in the cool shadows of button ball and alder bushes, and by which I could walk at evening and always hear in summer the fluty note of the vesper, and in winter the pipe of the white-throated sparrow. * * * As I have no place, who shall deny my praise of Maudellon's? What peace does dwell there and what dove's wings beauty! As my car approaches its precincts I feel the expansiveness of the outdoors tingling eyes and ears. I stop to listen for the country silences, broken only perhaps by the sonorous drum of the red-headed woodpecker, which loves the locust trees of this neighborhood.

If I stop to drink at the sulphur spring and see Maudellon silhouetted against a distant sky line, daintily picking her way across the brook, who shall say that this does not add a picturesqueness which the bare brown nature of this autumn season would fail to give?

On an afternoon not long ago, as I stood at the spring enjoying the picture as above outlined, I saw two mounted figures also approaching from another direction. They proved to be two friends come to explore Maudellon's possessions. After the honors of sulphur water, we looked at them inquisitively and they seemed to understand, for they at once began a most excessive admiration of the turnip patch in the immediate foreground, and the winter oats on the hills to the right suffered as well their urban heroics.

Our friends, booted and spurred, and with the last cut of a crop, had come for a ride, and they rode down everything, including the pike, at a rate so furious that I had to hang in my stirrups in a most lamentable cockney fashion, and Maudellon's hat danced on her head with frightful uncertainty. After a few leagues of this strenuosity, we came upon Maudellon's lane.

As we approached it the French teacher observed it at once. "What charming way is this?" she asked in her lovely idiom. "A lane, mademoiselle." "What is a lane, where leads it, what contains it?" came in a clatter. "Stop, stop, attendez," she cried to the others. "We shall see this way, this lane." "You must first ask the consent of my friend yonder," I replied, "she has the key." This was too confusing both for me in my French and for mademoiselle in her understanding, so Maudellon approached and bravely led the way up this sacred avenue.

I followed behind very reluctantly, noticing the bird nests which my careless observation had failed to locate during the summer; and the milkweed cones, setting adrift their gauzy seed; and the red berries of the *Cebetha caroliniana*, shining against the faded rows of golden rod; and the yellow primrose, still exhaling the perfume of summer evenings. Only a few stragglers among the birds gave the place any life, and the settled melancholy of the autumn had laid its hand on every green bower. I was glad that she did not remember and could not point out the place where the rabbits were found playing and where we stopped on our first invasion of this lane to eat supper. Although I protested with some lame excuse, still she took them within sound of the sheep bells and further on past the cardinal's grapevine bower. At last even she became convinced of their philistinism, and we turned back, soon to see over the hill Zenaida lying in the purple twilight.

E. M.

NASHVILLE, Tenn., November, 1902.

Natural History.

Growth of the National "Zoo."

"THE National Zoological Park has been in its present location since 1891, and during all of that time, nearly twelve years, but two animals escaped which caused the least trouble to the attendants, and those two are known not to have inflicted the slightest injury upon any living person."

This assertion was made yesterday by Mr. Frank Baker, Superintendent of the park, in response to a query as to whether or not the animals ever get beyond their confines.

"Many years ago," continued Mr. Baker, " we had a black bear confined in the dens down on the creek. The weather was cold and the ice formed rapidly. During the night the water running down the side of the rocky cliff froze as it reached the surface, and finally piled up so high that Bruin was able to climb over the side of his cage. He was soon detected by the attendants and an effort was made to capture him alive. Every time the attendants got him surrounded he would make a charge at one of them and break through the line by giving the man a great scare. Finally it was seen that the bear could not be captured alive, so orders were given by the then superintendent to kill the animal rather than to take any further chance of his escaping from the park and inflicting injury upon some person. This was done in a few minutes.

"The other escape was that of a small cub wolf a few days ago. And right here I want to say that that wolf is alive and well in the park to-day. It has not shown the slightest sign of rabies, as has been stated, and there is not the slightest symptom of anything being wrong with him. The wolf was born in the park and has never shown any of the bad traits of similar animals born in their wild state.

"When it is considered that there are now in the park 537 animals, 225 birds, and 116 reptiles, I think you will admit that we have made an excellent record and have been particularly successful. Few of the larger animals ever make any determined efforts to break out of their quarters. The lions, tigers, hyenas, and other inmates of the big animal house appear to be perfectly contented. Some of them, it must be remembered, were born in captivity, and have never known the free, roving life of their companions in captivity. The attendants say that the animals appear to grow fond of human companionship and appear less restless during the hours when there are visitors in the park.

"Those cages on the hill in which are confined the wolves, foxes, hyenas, and like animals have wooden doors, which are closed at night, making the escape of the animals less easy, and at the same time giving them a better opportunity for having a night's rest. The deer and the elk are probably the most favored of the animals, for throughout every day they are being constantly fed and petted by women and children, and they would probably not run away at all if they should get out of their confines."

There are recent arrivals at the Zoo that have added large interest to the collection and are much prized by the superintendent of the institution. Among these are a cougar from Oregon, three roseate spoonbills from Texas, two swamp wallabies from New South Wales, and a Tasmanian wolf with young from Tasmania, considered to be a very rare specimen.

The delightful weather of the fall has delayed the moving of the animals into winter quarters. Such of them as need warmth are fastened up at night and allowed to bask in the sunshine during the day. The new house for Dunk, the elephant, which is being built by a special act of Congress, providing $10,000 for the purpose, is rapidly nearing completion and will be ready for his occupancy in about two weeks. In this house he will be more comfortable than he has ever been since taking up his quarters at the Zoo, and it is understood it will not be necessary for him to be made fast continually with two heavy chains attached to his feet.

The eagles have been moved into a handsome new cage, which was recently completed, and the new flying cage, 158 feet long by 50 feet wide and 50 feet high, enclosing several trees and running water, built at a cost of $6,200, has proved to be a great boon to the feathered species. New bear yards for the kadiak bear and polar bears are being constructed and will be ready for occupancy in about a month. The antelope house has been renovated and repaired, and the temporary bird house has been enlarged by an addition of forty feet on the north end. Plans have been prepared for a modern and much more satisfactory aquarium to take the place of the barnlike structure now in use.

During the year forty-six animals were born in the park, among which were one lion, four gray wolves, five coyotes, five blue foxes, one American bison, one zebu, two Cashmere goats, one nilghai, seven American elks, one Virginia deer, one mule deer, three llamas, seven hutie-cougar, five prairie dogs, and two acouchy.

In addition to the specimens received recently a number of important additions were made to the collection during the past year. Mr. R. A. Gross presented a pair of young lions from Somaliland, Africa, and a pair of

young leopards were presented by E. S. Cunningham, United States Consul at Aden, Arabia.

Mr. Perry M. De Leon, United States Consul at Guayaquil, sent a kinkajou and a coati mondi. He also sent four sloths, but they died en route. Two Sitka deer, one of which died en route, were presented by Capt. Ferdinand Westdahl of the United States Coast and Geodetic Survey. A Liberian eagle was presented by Mr. James R. Spurgeon, United States Secretary of Legation at Monrovia, Liberia. Mr. E. H. Plumbacher, United States Consul at Maracaibo, sent a large crocodile. Some Lanzarote pigeons were sent by Mr. Solomon Berliner, United States Consul at Teneriffe. Four Newfoundland caribou and a pair of young moose were also obtained, but the moose died.

United States consular officers and officers of the army and navy and others attached to the service of the United States are constantly sending specimens to the Zoo, and it has been the aim of Prof. S. P. Langley, secretary of the Smithsonian Institution, under whose control and guidance the park comes, to interest everybody possible in the great work of perpetuating the specimens at least of the mammal, bird, and reptile kingdom.

Professor Langley hopes to be able to persuade Congress to carry out the plan originally mapped out for the park—that is, to treat it as it does the National Museum, as something not existing for the District of Columbia alone, nor to be maintained by the taxation of its inhabitants. While it is a national park, Congress has never considered it under one of the principal purposes for which it was founded, the preservation from extinction of national animal races. Prof. Langley will make an effort to secure the necessary appropriation for carrying out a plan he thinks will prove of greater benefit than anything that has heretofore been attempted.

Prof. Langley says experience has taught that many rare animals if secured and transported immediately from their native haunts are most unlikely to live under the conditions of civilization. They are, on the contrary, very likely to live and even perpetuate their species if taken with care and kept surrounded by the protection that experience and common sense suggest, and both these mean the continuance of the present National Zoological Park under the eyes of Congress, but with a simultaneous provision for first bringing up the wild animals in a commodious place of confinement in the country where they belong, large enough to allow the animals to live without a sense of captivity.

This place, Dr. Langley suggests, might be a small ranch where the things of vital importance after their capture, namely, their being "gentled" and accustomed to the sight of the keeper before being transferred to the National Park, can be carried out.—Washington Star.

A Pet 'Coon.

Opal, Wyo., Nov. 28.—*Editor Forest and Stream:* When a boy I owned a pet 'coon, which was as full of curiosity as a woman. One day (my mother was away) I gave him free range of the house, just to see what he would do. After going through my mother's workbox, scattering its contents over the floor, he began to rummage the pantry, pulling the cork out of the molasses jug, licking it, and trying to insert his paw into the neck of the jug; then standing on tiptoe, he grasped the edge of a pan, full of milk, when splash! down it came, pan and all, on his head.

Ned was very fond of all kinds of sweets, especially loaf sugar, and I remember how his "sweet tooth" once got him into trouble. On the occasion referred to, I had gone to the barn with a pan of salt for the horses, and my pet trotted after me. I set the pan down and left it there for a moment. Soon I heard a coughing and sputtering, and running back, I found a very sick 'coon, and a good portion of salt missing.

One day I shut him in the granary as a punishment for some of his pranks, but when I went to let him out, he was nowhere to be seen. I gave up all hope of ever finding him; but what should I see, when I happened in the loft above the granary, but my long-lost friend, squatting on my bed, which I had slept in during the warm weather. He must have climbed up one of the perpendicular two by fours, then crawled along a horizontal eight by ten on the ceiling, back downward, to be able to get through the hole in the ceiling. Here he sat on my bed, blinking his eyes and yawning, as if he had been enjoying a huge nap.

Having one morning prepared his breakfast of bread and milk, I set it away out of his reach till I could straighten his trough. But like some "human 'coons," he grew impatient to get at his meal. Reaching out one of his hind feet, he dexterously pulled the feed pan within reach, and proceeded to help himself to its contents.

J. R. M.

Destruction of Plovers' Eggs in England.

St. Augustine, Fla.—*Editor Forest and Stream:* Our old friend, John Bull—of England, don't you know?—has always been fond of poking sticks at us, and shows no disposition to let up; but he also has some vulnerable spots, and I think it only fair to balance matters by retaliating. Nearly every city boy in England who goes into the country on a visit, makes it his principal object to rob every bird's nest that he finds, and instead of reading him a lesson on cruelty, his teachers and parents encourage his villainous habits as part of a scientific education.

To this charge I will add the universal British traffic in plovers' eggs. During the nesting season the London market is flooded with plovers' eggs, and if that is so in London, why not in every other town in England?

Now, here is wholesale destruction of one of the most useful insectivorous birds in the world, and there are not, in the aggregate, brains enough among the farmers and legislators to make the slightest move in checking it. Not only would the crops be benefitted if every insignificant egg—as a market item—were left to hatch, but the country would swarm with one of the finest of game birds that would make a marketable product worth considering. It is a matter for surprise that all the birds of England are not exterminated.

The Siberian Mammoth.

Some eighteen months ago the Governor of Yakutsk informed the Imperial Scientific Academy of St. Petersburg of an unusually interesting discovery in Siberia. A Cossack had learned from the natives that a gigantic animal with huge tusks had been found embedded in the ice on the Beresovska, a tributary of the Kolyma River, about 200 miles from Svedin-Kolymsk. From the description given it seemed probable that the animal was a mammoth, and Dr. Otto Herz, director of the museum, and Herr Psitzemayer, naturalist, were authorized to proceed to the spot and bring it to St. Petersburg in as good condition as was possible under the circumstances. The animal is now in the Russian capital, where it is being preserved and set up. Special interest attaches to it, as it is the most complete specimen of this long extinct species ever yet obtained. Although in Dr. Herz's opinion it is 8,000 years old, the skeleton is in wonderfully good preservation, as is also the hairy covering of the skin. Messrs. Herz and Psitzemayer succeeded in carrying out their mission successfully, but not without many difficulties. Last summer they traveled to Yakutsk, and then their troubles commenced. From that point to where the mammoth had been found was a distance of 1,200 miles, which had to be traversed on horseback. The country was an extremely difficult one; mosquitoes swarmed, and in the dangerous swamps it happened more than once that a Cossack and his horse disappeared without leaving a trace behind them. At length in the autumn the party reached their destination, and found, to their satisfaction, the huge beast, resting in an almost horizontal position. Probably it had stumbled when grazing and fallen into a crevasse. The forelegs, especially the left one, were much bent, which showed that when attempting to recover itself the animal's body had proved too heavy, the hind legs slipped underneath it, and it became frozen fast. Thus the beast perished, and has ever since lain undisturbed beneath the layer of earth which in the course of ages formed above the ice, until at length the warmth of the sun exposed it to the light. It was necessary to remove the remains before the advent of spring, otherwise it would have been too late. Wild animals had already begun to tear at the flesh, and to preserve the remains on the spot was impossible, as a body which has lain for so long in the ice decomposes with greater rapidity when exposed to the air. It was, therefore, determined to divide it into several parts, forwarding each in a frozen state, and putting them together afterward. A hut with a stove in it was constructed over the mammoth, and as the ice gradually melted the portion thus released was removed and duly prepared for transit. The entire process of excavation occupied two months, during which time the open air temperature was 50° Celsius. The legs and feet resemble those of an elephant, except that the latter has three toes, the mammoth five. The hair is of a brownish yellow color, and is so long and thick that its owner could hardly have felt cold in any temperature, however low. The skin is from 20 to 23 mm. thick, and underneath it there is a layer of fat 9 mm. thick. Blood was found in the body, and in the mouth there was the remains of food on which the marks of the teeth were impressed. The contents of the stomach were enormous, and in quite a fresh state. In spite of the great difficulties of the journey, all the various portions were conveyed without injury or loss to St. Petersburg, and now constitute a unique trophy.—London Field.

A Skinned Beaver.

Hurrying along the streets of Cairo, Ill., the other day to keep a dinner engagement, as I passed a meat store I saw hanging upon the rail in front a skinned beaver. I had little or no time to spare, but I nevertheless paused sufficiently to look the animal over. It was flayed with the greatest of care, not a scrap of fur even being left upon the head the size of a dime. It was literally skinned to the teeth. The butcher had run the hook into and under the lower jaw, resulting in a partial distension of the jaws and an exhibition of the chisel-like teeth of the animal.

The paddle-like tail with its rubber-like skin was yet a part of the animal, and evidently had not been appropriated by the hunter and stewed or broiled, or whatever they do to a beaver's tail, to make one thank the gods that one lives and eats.

It is a serious matter aside from the etiquette of the case to keep a host's soup waiting, and appreciating the enormity of such an act, I hurried on, as much as I wanted to go in and find out all that butcher knew about the rare exhibit in front of his shop.

Such a sight in Fulton or Washington Market would undoubtedly cause some comment in the daily press, and, if the law on beaver is closed in New York, probably the confiscation of the carcass.

Anyway, the sight was a novel one to me, for I had never seen a beaver skinned and hung up like a calf in front of a butcher store before. A slaughtered buffalo would not have surprised me more.

Charles Cristadoro.

Samoa 'Uma.

Mrs. Churchill, the wife of an American Consul-General in Samoa, has written a charming account of its interesting and singular people. A lover of nature and fond of sports of field and water—she was almost as much at home in the surf as a native, could cast a fly and handle a rifle—the author lived out of doors when her housekeeping duties were not too exacting, and having an inquiring mind, there was nothing in the free Samoan life that escaped her.

In Mrs. Churchill's pages you shall also read about the handicrafts, art and music of the Samoans, their traditions and their sports, and this information is conveyed in a sprightly and unaffected style, proving the enthusiasm of the writer. You may also read of the shooting of the perilous and therefore exciting passage of Apolima, an experience which makes the hair of the venturesome stand on end; of the weed that catches fish; of spearing by torchlight in the tidal pools; of the chase of blue rats with the throwing stick, and of how toothsome a meal these little creatures make; of innumerable hideous things that swarm and crawl and creep; of the vampires of the Tuasivi; of some South Sea hoodoos; of the incorrigible, shameless beachcomber, and of sundry other odd, novel and wonderful things. A chapter with a very attractive title is "Samoans Fickle Brides," and few will pass it by. "Samoa 'Uma," which means "All Samoa," is certainly a book that kills time, and having read it, you will know the human side of Samoa and a good deal about the biological.—New York Evening Sun.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in Forest and Stream.

The New York League.

Special Report to Forest and Stream.

There was a good attendance at the annual meeting of the New York State Fish, Game and Forest League, which was held pursuant to call, at the Yates Hotel, in Syracuse, Thursday, Dec. 4, and the proceedings were of a very interesting nature. Some of the discussions were quite spirited, showing that those who participated were deeply in earnest, but the best of feeling prevailed and everyone manifested a disposition to sacrifice personal views and preferences in deference to the will of the majority and for the greatest good of the greatest number. The delegates present were:

New York Association for the Protection of Fish and Game—Robert B. Lawrence, John C. O'Conor, New York city.

Anglers' Association of the St. Lawrence River—W. H. Thompson, A. C. Cornwall, Alexandria Bay; R. P. Grant, Clayton.

Anglers' Association of Onondaga County—C. H. Mowry, F. C. Eddy, John H. Forey. Alternates: George C. Kirk, Henry Loftie, George B. Wood, J. L. Perry, Syracuse.

Black River Association for the Protection of Fish and Game—W. E. Wolcott, Utica; W. L. Fowler, Holland Patent.

Spencer Sportsmen's Club—W. S. Gavitt, Henry Killick, Lyons; H. B. Whitney, Phelps.

Schenectady County Fish and Game Protective Association—Dr. A. L. Sitterly, Schenectady.

Niagara County Anglers' Association—Charles W. Hatch, H. K. Wicker, Lockport.

Genesee Valley Fish and Game Protection and Propagating Association—John R. Fanning, Rochester.

Geneva Fish and Game Protective Association—Dr. W. H. Jordan, C. C. Gates, Charles S. Burrale, H. K. Schieffelin, Geneva.

Seneca Falls Sportsmen's Club—Ernest G. Gould, Seneca Falls.

Honorary Members—Aaron Mather, Bridgewater; Maj. J. W. Pond, Albany; James Annin, Jr., Caledonia; Assemblyman Williams, of Onondaga county; John D. Whish, of Albany, Secretary of the Forest, Fish and Game Commission, and J. H. Levitt, of Gloversville, were also in attendance.

President R. B. Lawrence called the meeting to order at 10:30, and expressed the pleasure it afforded him to meet the members of the League again. He was pleased to greet the new members as well as the old. He believed the great need was for more clubs to become identified with the League.

Treasurer A. C. Cornwall's annual report showed: Balance on hand last year, $68.69; receipts, $95; total, $163.69; disbursements, $80.83; balance on hand, $82.86.

Chairman C. H. Mowry, of the Legislative and Law Committee, reported that his committee had tried hard to secure the passage of a bill to prohibit the sale of grouse and woodcock killed in this State. He said such a bill passed both houses, but the Governor allowed it to die. Mr. Mowry thought it best to push the bill again this year. A bill to prohibit the taking of more than 25 pounds of fish from Oneida Lake in a day was prevented from passing. The passage of a bill to permit the use of batteries for shooting ducks on Cayuga Lake for one or two days in a week, shared a similar fate, as did also one to allow netting in certain portions of Cayuga Lake.

Another bill was presented permitting fishing through the ice for pike and pickerel in certain waters not mentioned in the old law. It permitted twenty lines in Oneida Lake and other waters. The argument was that they wanted to legalize what had been practiced a long time, the claim being that it did no harm. The commitee deemed it best to concede the fishing in the waters asked for.

President Lawrence said it was a matter of congratulation that the Legislative and Law Committee had done such effective work. On motion of R. P. Grant a vote of thanks was extended to Mr. Mowry for his earnest efforts as chairman of the committee. Mr. Mowry thanked the League for its approval of his action and the expression of appreciation of the work done.

W. S. Gavitt, chairman of the special committee on organization, reported that circulars had been sent to different organizations of sportsmen throughout the State calling attention to the necessity for cooperation and becoming members of the league. Some of the associations have sent representatives and others have signified their intention of joining. He thought the League should have representation in every county in the State, and suggested that it might be well to make it possible for individuals to become members of the League on payment of $1 each.

Resting on a table in the center of the assembly room was a big muskallonge from the St. Lawrence River, and President Lawrence called on W. H. Thompson to explain how it came there. Mr. Thompson said the fish was caught in the river the day previous, and he brought it down to show what had been done there in the way of propagation. Muskallonge are caught in the St. Lawrence weighing from 5 to 50 pounds. For six or eight years the State has been very liberal in supplying fry of the muskallonge and wall-eyed pike for stocking the river, and the work is necessary to maintain good fishing. For three months of the year on the St. Lawrence reservation there are a thousand boats out fishing, and it requires a good many fish to supply them. With all the fishing that has been done, however, the fishing is improving. Not long since he saw six bass brought in at Alexandria Bay which weighed 31½ pounds, and one of the number weighed 6½ pounds. Another fishing party a short time ago caught three muskallonge weighing 12, 20 and 39 pounds respectively. Mr. Thompson said there had been some talk in favor of the netting out of coarse fish to benefit the game fish, but this plan was tried years ago, and the result was that it took many years to get the fishing back to where it was as good as it was before netting was allowed. The St. Lawrence Anglers' Association feels well repaid for the money that has been expended in getting things where they are. We ask the League, continued Mr. Thompson, to recommend that the law be allowed to remain as it is now in the St. Lawrence reservation, and that no netting be allowed there except for minnows.

Mr. Gavitt offered a resolution that the constitution be so amended that any individual desiring to connect himself with the League could do so by payment of $1, and that there be not to exceed five such members from any one county. He thought unanimous consent would be necessary for the consideration of an amendment at this time.

Mr. Mowry.—Then five individuals could come in from a county and outvote the two delegates of a club.

Mr. Gavitt.—I do not think there would be any abuse of the provision, but I would not object to making the number three instead of five.

Chief Game Protector Pond favored the resolution, saying that assistance was needed in every county. There are some counties which have no sportsmen's association, but if the resolution prevails you will get sportsmen from all over the State who will aid the League, and not abuse the privilege. They will not join the League to oppose better legislation.

John R. Fanning also favored the idea. He thought the association was organized on too narrow a scale. With an abundance of money in the treasury much can be accomplished which can not be without it. He said there were bays near Rochester where the game laws were violated by netting. He hoped the resolution would prevail.

John C. O'Conor moved that unanimous consent be given to amend the constitution in regard to membership. Carried.

Mr. Mowry suggested that some measure be taken to restrict the voting power of individual members so that they could not in any county exceed the voting power of a club.

On motion of Mr. Gavitt, the president was authorized to appoint a committee of three to consider the proposed amendment. Messrs. Gavitt, Fanning and Wolcott were named as such committee.

Mr. O'Conor spoke at some length concerning legislative matters. He referred to the bills passed at the last session of the Legislature, 9 of which affected game, 13 fish and 2 were general. Section 173, said he, relates to the powers of game protectors, and why should they not have the same powers in the counties of New York and Kings as they do in other counties? I would like to have the committee recommend that this section be amended by striking out the clause excepting the counties of New York and Kings. Mr. O'Conor then called attention to Section 141 of the game laws. He thought a portion was put in for the benefit of cold storage warehouses. The speaker also referred to the section relating to wild fowl. He said there was great objection to limiting the season on Long Island as early as March. It seemed to him that with the great opposition from Long Island it would be almost impossible to prohibit the shooting of wild fowl as early as that, but it might be possible to prevent the sale of the birds after March 1.

Major Pond was pleased to hear something from Long Island. This matter had been threshed out in the League, and the conclusion reached that Long Island was a kingdom by itself. He said there were good results from the cold storage law this year. Representatives of the Forest, Fish and Game Commission were allowed to examine goods when the closed season began and seal them. The seals were not broken during the closed season. Thousands of insectivorous birds were found and this put the commission in a position to commence action for these birds, which are not allowed in possession at any time. So much for Section 141. In the counties of New York and Kings the protectors have only got to go a block before they can get a search warrant, but in the rural districts they sometimes have to go miles to get one.

Mr. O'Conor admitted that a portion of Section 141 was very good. One of the good things we got out of the Legislature was the section about insectivorous birds. Can the major tell me why a man should give a bond to break a law? We want to repeal Section 141 and strike out in Section 173 the provisions excepting New York and Kings. It is difficult to get search warrants. Give the game protectors the same rights in New York and Kings they have elsewhere. We want the right of search in cold storage warehouses and we want it illegal for anyone to have game in possession in the closed season.

Major Pond.—I did not say the department would be displeased if the protectors had the power of search.

Mr. Fanning asked Major Pond how many cold storage warehouses there were in the State. He thought perhaps a dozen.

The chair appointed Messrs. Thompson, Forey and Wicker as a committee on nominations, and declared a recess until 2 P. M.

At the afternoon session Chairman Mowry, of the Legislative and Law Committee, reported a number of proposed amendments to the game laws, and the League decided to recommend the following: That the counties of Sullivan, Ulster and Greene be brought under the general law as to ruffed grouse and woodcock. That the open season for quail shall close November 30, except on Long Island, and that the season for black and gray squirrels shall end on the same date; to amend Section 176 so as to give such special game protectors as are in the employ of boards of supervisors or of any regularly organized club for the protection of fish and game, the same powers of search that the regular protectors have; to amend Section 80 relating to fishing in Seneca Lake, by cutting out the four lines about taking fish with spears; to provide that wild ducks and geese shall not be offered for sale after March 1 in any year until the open season begins; to prohibit the sale of grouse and woodcock killed within this State.

There was a lively discussion over a proposition that the club also recommend that the sale of quail be prohibited. Dr. Jordan, Assemblyman Williams, Messrs. Mowry, Forey, Fanning and Grant spoke on the subject. It was decided that such a bill could not be passed at present.

Quite a debate concerning spring shooting followed the presentation of a proposed new section, to be known as Section 143, to provide that there shall be no open season for any birds earlier than Sept. 16 or later than Dec. 31. It is intended that the law shall not be construed to affect bird seasons which may open after Sept. 16 or close earlier than Dec. 31.

President Lawrence spoke of the bay bird shooting on Long Island in July and August, and suggested that Long Island might be excepted from the proposed section.

Mr. Mowry thought there would be objection in the rest of the State to having spring shooting allowed on Long Island and not elsewhere. The Legislative and Law Committee reported in favor of the section by substituting for "birds" the words "web-footed wild fowl." The League decided to recommend such a measure.

Mr. O'Conor offered a resolution that the League favor a bill repealing so much of Section 141 as relates to the giving of a bond. Adopted.

Mr. O'Conor also offered a resolution that the League favor striking out in Section 173 the exception in regard to the counties of New York and Kings. Adopted.

Mr. Cornwall presented a resolution protesting against any change in the laws relating to the St. Lawrence reservation calculated to permit netting, except for minnows. Adopted.

Mr. Gavitt, of the special committee, presented a resolution to amend Article 15 of the constitution so as to permit individuals to become members of the League on payment of $1 annual dues, those representing each county to be entitled to two votes, providing there is in said county no organization connected with the League. Adopted.

It was decided to recommend that the sale of venison in the Adirondack Park be prohibted within the blue line.

The committee on nomination, Messrs. Thompson, Forey and Wicker, reported in favor of the following officers, and the same were duly elected: President, Robert B. Lawrence, New York; Vice-President, H. K. Wicker, Lockport; Secretary, Ernest G. Gould, Seneca Falls; Treasurer, A. C. Cornwall, Alexandria Bay; Legislative and Law Committee, Chairman, C. H. Mowry, F. C. Eddy, W. S. Gavitt, R. P. Grant; Auditing Committee, Aaron Mather, W. G. Babcock, C. W. Hatch; Biological Committee, James Annin, Jr., Geo. B. Wood, Henry Killick; Organization Committee, W. S. Gavitt, W. E. Wolcott, J. H. Forey.

W. E. Wolcott.

Utica, Dec. 5.

Maine and Massachusetts.

Hunters' Licenses.

Boston, Dec. 6.—*Editor Forest and Stream:* The question whether Maine should have a law requiring hunters from other States to purchase the privilege of killing game in the State is one that interests Massachusetts sportsmen very much.

As is to be expected, there is great diversity of opinion among them. Some go so far as to say, that, in case such a law is passed, they will abandon their autumn trips to that State and go to Canada or Nova Scotia instead. Your readers are aware that many New England moose hunters prefer to go to New Brunswick and pay $30 for the privilege of hunting rather than go to Maine, believing their chances of securing a fine trophy in the latter regions a great deal better.

This class of sportsmen will naturally continue to pursue the same policy. But will those who consider Maine the "paradise for sportsmen" take kindly to a license law?

The question is not altogether a new one, but the positive manner in which Chairman Carleton has recently recommended the enactment of such a law brings it to the front just now. I have been to some pains to obtain the views of some Boston sportsmen in reference to it. One of them recently returned from an extended trip to northern Aroostook, tells me the woods were full of "so-called sportsmen," as he expressed it. He said for his part he would be glad to see a law passed requiring a fee of $50 for hunting big game. On his trip he said he "found people everywhere," and he could not get away from them. This, bear in mind, was in a very remote part of the State. The view expressed by this gentleman represents one extreme. That of another who said he should never care to pay a license fee for hunting in Maine, represents the opposite extreme.

Several have remarked that they would not object and, in fact, would be quite willing to pay a moderate fee, provided resident sportsmen were required to contribute also. It is a matter of common knowledge that men from large towns and the cities of Maine as well as from places without the State, have been going into the wilderness the last few years (since deer have become so numerous) with the idea of bringing out game enough to defray a large part of the expense of the trip. The venison they bring home finds its way into the markets.

These men, no doubt, are fond of the woods. They derive enjoyment and get relaxation from their outings, and they would resent being called "pot-hunters" or "market-hunters," but are they doing their part as sportsmen?

How many of them are members of any game protective society or club? How many of them contribute a single penny toward the care or propagation of fish or game, either in their own State or elsewhere?

They certainly cannot claim to be ranked as sportsmen of a high order. Let them show a disposition to aid the cause according to their means, be it never so little.

One Deer Only.

I would suggest as a remedy for market-hunting that instead of allowing two deer to be deported, as under the present law, only one should be permitted. This would certainly be ample for the sportsman to distribute among friends. It will be conceded by every one that game of all kinds should be so used as to confer the greatest good upon the greatest number. As a product of great pecuniary value to the State, it is her policy to adopt such regulations as to its capture and use as will best promote the welfare of her citizens as a whole.

Hundreds of men depend on the patronage of sportsmen for a living. If a license fee so great as to deter the patrons of camps and hotels in the wilderness from making their usual trips be charged, the result must be a greatly reduced income to the proprietors. Among those who have for years been accustomed to hunt without paying for the privilege, there is a natural feeling of opposition to the change, but if a moderate sum be exacted from non-residents and residents alike, or, possibly, a smaller tax be levied upon Maine citizens than upon those from without the State, and the proceeds be devoted to improved protection, very few would make serious objection, and, in my opinion, the business of hotels, camps and guides would be continued without serious detriment.

The raids of large parties from Indiana and Ohio upon Maine game furnishes an argument in favor of the license system, also, it seems to me, for reducing the quantity of game that may be deported. If reports of such incursions are reliable, they come near being a nuisance, a menace not only to the game, but to human life as well.

I have heard men say that every deer they had killed cost them at least a hundred dollars, and a Boston sportsman who recently returned from a trip of a few days in company with four others, showed me the footing of their expenses amounting to $800.

The fact that more deer have been shipped out of the State this year than ever before at this date, indicates to my mind that they were never more abundant and that there has also been a larger number of hunters as well. Deer have unquestionably spread over larger areas within the last few years, not only within the State, but they have passed over the western boundary into New Hampshire, still further into Vermont and are now working into Massachusetts in very considerable numbers. Reports of deer being seen in every county of this State are coming in almost every week.

Only last week a doe was captured while swimming in Barnstable Bay and liberated in the Lynn (or Saugus) woods. The time may come when men of the old Bay State will find no difficulty in furnishing their tables with venison without going several hundred miles for it.

Commissioner Carleton will doubtless have the support of the farmers and of men in the lumber business. In fact, the Lumbermen's and Landowners' Association, at the annual meeting in Bangor, on Dec. 1, adopted a resolution in support of the measure.

At the meeting of the Maine Sportsmen's Association, to be held Dec. 10, the question will no doubt be thoroughly discussed in all its bearings, and it is to be hoped that a conservative policy will be recommended.

Every true sportsman surely desires to see the killing of both deer and moose kept within such limits as to insure their increase rather than a reduction in their numbers.

Indiscriminate slaughter of does should, it seems to me, receive the attention of game protectors. The number of half-grown deer coming through on the trains of late years is surprising. This killing of fawns is "murder of the innocents" and should be abandoned by all men claiming to be in any sense sportsmen.

I have heard the claim made that Maine is unable to afford a larger appropriation for the work of her commission. That position is untenable. The same claim was made at the session of the Legislature in 1894-5, but the appropriation was largely increased, notwithstanding the objections of opponents. The State cannot afford to withhold money needed to keep up the work so ably conducted and to carry it forward to still greater completeness. It is to be hoped such legislation will be had the coming winter as will show that Maine is ready to do her part and does not wish to exact everything from non-residents who gladly pay liberally for such entertainment as her forests afford.

Henry H. Kimball,
Sec. Mass. F. and G. Prot. Ass'n.

Massachusetts Law Enforcement.

The work goes bravely on in Massachusetts. From Chairman Collins, of the commission, I learn that Deputies Luman and Shea recently got Joe Bugbee, of West Brookfield, for attempted sale of thirteen partridges. On Nov. 30 they took three men for Sunday hunting; also that a man was arrested in Marshfield for Sunday gunning.

He writes further: "I am certain the game laws were never enforced in this State as they have been this fall. Snarers, ferreters and those trying to sell game illegally have felt the pinch of the law. The result has shown what a trained and centrally directed force can do. There is no question but we have broken up a lot of illicit work."

The requirements have been such that the commissioners have been forced to supplement the labors of the regular paid deputies by putting on an increased force for special work.

From Greenfield.

A large and growing club of two years' standing bids fair to be a power in that section of the State. The writer had the pleasure of meeting the members on the occasion of their second "Annual Game Supper." Roast 'coon, rabbit pie and venison furnished a tempting menu, and the occasion was one of rare enjoyment. The president, Mr. Charles C. Russell, presided with grace and dignity, and among the speakers were Dr. Newton, Deputy Wm. Leipple, Mr. Daniel Collins and others. The membership of the club is about two hundred.

From Westfield.

Still the good work goes on. Mr. Charles N. Lewis writes from this thriving town as follows: "I have worked hard to form a fish and game association here, and have got it going in fairly good shape now."

Hon. George W. Wiggin, former president of the State Association, recently returned from a trip to "The Forks," Maine. In the party were also Mr. Bradley Rockwood, of Franklin, and Mr. Howe, of Boston. They went in via Bingham and to a camp on Moxie Pond. They report a horde of Westerners in the region, but were able to find a secluded spot where they secured three deer.

James R. Reed, president of the State Association, writes from New Brunswick that he finds caribou plenty, but has not yet seen a bull moose; saw several cows.

Among those who have returned from Maine with moose are C. H. Randall and F. Webster, of Boston, and Charles Harmon, of Lynn. John W. Farley, George Carter, E. G. Penniman, F. F. Cushman, Mrs. J. L. Cushman, A. D. Wright, F. W. Thurston, J. C. Chamberlain, Mrs. Chamberlain, G. W. Sullivan, E. G. Morse, W. B. Berry, G. R. Noble and Frank E. Wilson, all of Boston, have recently returned from Maine with deer.

CENTRAL.

Massachusetts Game Laws.

Editor Forest and Stream:

It is very doubtful if there is another State in the Union that has better protective laws for fish and game than the old Bay State. More than two decades ago summer woodcock shooting was made illegal. For the past three years spring duck shooting has been prohibited. For the same length of time the open season on woodcock, partridge and quail has been limited to the two months of October and November, which is all the time that should be allowed under present conditions.

We also have a law prohibiting the sale of woodcock and partridge at any time, which was brought about by the sportsmen with the aid of the marketmen, who agreed not to buy or sell these fast disappearing birds, and we have good reason to think they deserve the praise of having lived up to their agreement for the past three years. This law has produced good results and saved a great many birds, as it is estimated that from 15,000 to 20,000 were shot for the market annually. These two valuable game birds cannot be successfully bred in captivity, and turned loose to replenish the exhausted covers like the quail. The woodcock and the woodduck being migrants, are being persecuted at both ends of the line, North and South; it is like burning the candle at both ends. It seems a great pity these birds are not protected in every State in the Union during their breeding seasons. Spring and summer shooting should be abolished everywhere. We have a very efficient board of fish and game commissioners. The arrests and convictions of lawbreakers have been many, and the fines so heavy as to teach them that the commission has not been idle, and the way of the transgressor is hard.

GEO. L. BROWN.

Massachusetts Poachers Discouraged.

BOSTON, MASS., DEC. 4. The good work of enforcing the game laws has gone on as usual since I last wrote you. On Sunday, Nov. 23, two of the game wardens "surrounded" six Sunday hunters down in East Douglas, and each one of them was convicted and fined $15. Since then, deputies Luman and Shea have captured Joseph Bugbee of New Braintree for having in possession for sale thirteen partridge. Bugbee was tried on December 2 at Gilbertville on one bird and fined $20, and Judge Healey continued the case of sentence on the other twelve birds and told Bugbee that if the court learned of other transgressions of the game laws on his part the full sentence would be imposed. On the same day Luman and Shea secured two other convictions for violations of the game laws, and beside these, four other convictions have been secured this week by other deputies.

This vigorous work has had a most salutary effect and the would-be poachers and pot hunters are badly scared, so much so that in sections where the game laws were never before respected, there is a decided change now.

BAY STATE.

New Hampshire Deer Hunting

With a Bear Episode.

I HAVE just returned from a short trip after deer. I understand that there have been more deer hunters in northern New Hampshire this season than ever, and very few deer have been killed, and most of what were, were shot by parties watching near apple trees. My hunting grounds were in the vicinity of Merrill's Mountain Home, on the road leading to the top of Moosilauke Mountain. Some two miles from Merrill's are two deserted farms; they are but a short distance apart, and the deer go from one to the other. There is a barn on one farm and a house and barn on the other. There are also a number of apple trees, and I think about all the deer in that section go to those apple trees. They show considerable sense and go as I judged about midnight. The morning after my arrival I was at one of the barns at daybreak and not a deer was to be seen, though there were plenty of sign that they had been there.

The next day it began to snow (there was no snow before), and I thought I should get a chance to do some still-hunting. With the perversity of such snowfalls (when one is on the hunting grounds), it was a mixture of snow, rain and hail. and the result was the noisiest kind of traveling.

Before daybreak the next morning I was at the barn. The snow told the story of the preceding night. Deer tracks were everywhere, of big deer and small deer. The snow was completely cut up. The house and the barn are some thirty-five yards apart, and three deer had walked between the buildings. I circled around that ground and found that some six or seven deer had made all the tracks. The day was very still and the snow very noisy, and the frozen leaves under the snow in the woods made more noise than the snow. There was about one chance in a hundred of getting a shot by tracking. I took a couple of tracks and followed them as carefully as I could for about an hour. They led straight up the mountain and showed no signs of wanting to stop. I expected to see signs of their stopping to lie down, and I intended then to try and circle around such places. Well, I saw what all still-hunters often see, two fresh beds and two sets of tracks where the deer had gone on the jump. I then struck north along the side of the mountain, and after a time found the track of a very large buck. He led through some quite open hardwood growth, and I began to have hopes of getting a shot. I tried my best to get that deer, keeping most of the time some fifty yards to one side of his trail and using my eyes for all they were worth. After about an hour I saw the buck a long way off. He had just turned broadside to me, and went out of sight. I could not think what had become of him. I knew he did not run, and thought he might have lain down. I watched for a few minutes, then worked up, and found that a small break ran down the mountain and the deer had followed it up and there was just bank enough to cover him. I followed him then for two hours and jumped him in some thick spruce, never getting a glimpse. I gave up then trying to do any more tracking. I did not know where I was, and it was about all I wanted to do to get out of the woods. Men born and bred in that or similar regions may enjoy slabbing those mountains. It takes the wind out of me to do much of it.

After that I spent a number of hours watching from the barn. On the last morning I climbed up under the eaves of the barn and saw a deer so far away that it looked about as large as a sheep. It turned and walked into the woods, and I started for Merrill's and took the afternoon train home.

A neighbor who is a first-rate still-hunter and also a very lucky hunter, was hunting in the vicinity of the three ponds in Ellsworth. He was some six or seven miles east from where I was, but there was quite a bunch of mountains between us. It so happened that we both came home on the same train. His experience was about like mine. He had not seen a deer, but had found five times as many fresh signs. He jumped deer after deer, and no matter how carefully he worked, he could not get a glimpse of one. He found it just as noisy as I did.

I do not see how there can be any fair still-hunting this season. In the region where I was there is some four inches of noisy snow and the frozen leaves under it are worse. Six inches more of dry snow would not kill the noise. Should the present snow go off and more come afterward, there might be some hunting, but it is not likely, as there is less than two weeks of open season left.

In some instances that I heard of where deer were killed, luck had a great deal to do with it. A man (as I was told) started out one day on bare ground, took his horse and wagon and drove along a road to where an old lumber road came down off the mountain. He tied his horse and walked some two hundred yards up the lumber road. Saw a deer walking down the road and shot it. While dressing this deer he saw another coming toward him; he shot that one. A few minutes later he saw a fox coming down the road, and he killed the fox. He then dragged the deer out and loaded them in his wagon and started for home. After going a short distance he saw another fox coming toward the road; he shot that fox also. He said he was gone from home just three hours, and killed two deer and two foxes, and did not have to work to get them.

Now as to Merrill, of the Mountain Home. Merrill catches some bears. He also keeps some sheep. The bears catch his sheep and he catches the bears. I think Merrill would be willing to lose more sheep if he could catch more bears.

Merrill has a sort of frog pond in a swamp up in the mountains back of his house. In years past he has caught some fifteen bears at that place. Merrill says that when a bear strays that way he nearly always goes through that swamp at a certain place. Merrill has made a sort of loose brush fence there, leaving an opening for the bears to go through. He sets his traps in the opening, using no bait. The trap patiently awaits the coming of the bear. Last May a bear took four sheep, and the trap was set. The first time the bear came that way he stepped over the trap. The second time a hedgehog had the trap, or the trap had the hedgehog. The third time the bear did his part and got caught. The trap was set in May and the bear got into it in September. Now, catching a bear in a steel trap does not mean that you go to where the trap was set and find a bear in it. It means that both trap and bear are gone. This bear was easily tracked for some distance, then the bear used his wits and got rid of the clog of the trap. He was followed for a while and then all traces were lost.

Merrill says that a bear will pick up a trap and carry it, leaving no trail on hard ground. Merrill made a wide circle around in the direction he thought the bear would go and found the trail. It was followed a long distance, and the bear was found. I saw a photo of it as it lay dead in Merrill's door yard.

On my way home I saw several returning deerless sportsmen. There is one thing this tracking and still-hunting of deer is doing, and doing it thoroughly. It is making the deer very much wilder. Years ago in sections where deer were hunted with dogs, one when hearing the footsteps of a still-hunter, would jump up and stand looking, waiting to see what was coming. After being still-hunted for a time, they lost all such curiosity. They jumped up and left at once.

Now, I am not at all satisfied with the result of my recent trip. From near my house I can see the mountains in the region where I hunted. Should I hear that the snow there goes off during the present week, I shall go up and spend the last few days of the open season. It may prove unsuccessful, but there is nothing like trying.

C. M. STARK.

DUNBARTON, N. H., Dec. 1.

Currituck Shooting.

CAROLLA, N. C., Dec. 2.—The November record is 1,000 ducks, 500 geese, 300 swans. Most of the ducks are canvasbacks and redheads. One party from Washington killed 300 ducks, 5 swans, 15 geese in two days. One party from New York 6 swans, 20 geese, 200 ducks, in four days. Another party from New York, 2 men, shot 150 ducks, 3 swans, 25 geese, in two days, and the oher fowl were shot by Ross White and Miss Lee White.

L. R. WHITE.

Guns and Their Handlers.

Editor Forest and Stream:

While the hunting season is on we can seldom pick up a paper that does not give at least one account of an accidental shooting from some cause or another.

Mr. Joseph W. Shurter, in the current number of the FOREST AND STREAM, gives his opinion as to what causes some of them; and he is right. A man who has taken too much whisky has no business with a gun either in his hands or his pocket. I have no dislike for whisky or the men who use it; I can use it myself, but I don't need any when I am traveling around with a gun.

But I have often thought that our modern breechloaders should have the credit for a great many of these accidents. There are some of us still living who began shooting years before we had any breechloaders. Then we did not blaze away at every bush or bunch of grass we saw moving. We waited until we saw what was moving it, and were sure we did see what it was before firing; for if we missed, before we were ready to fire again whatever we were shooting at would be half-way across to the next county. But now with the breechloader that only needs a twist of the wrist to reload, we can keep on pumping lead until the magazine is empty, and by that time we will have hit something, if it is only a stump on the side of a hill half a mile away. If it is not a man who stops one of these balls, then that is the man's fault, not ours; we have not stopped long enough to see whether he was in range or not.

The man or boy who carries his gun by the muzzle and drags it out of a wagon or boat or through a fence with the muzzle pointed toward him, belongs to a class by himself, he will shoot himself or some one else sooner or later; that is a foregone conclusion.

If it should be a boy who is doing this, he will get a lesson as to how to handle his gun, from me, before he goes any further. If it is a man, then I want to go further myself and get clear out of his neighborhood before the catastrophy takes place, then let some other unfortunate get that charge of buckshot.

The last shooting accident that I saw a notice of was where two young men in our own State here were hunting quail; one of them had just stooped down to pick up a dead bird when his companion fired, sending his load of shot into the head and shoulders of the man who was stooping here at his feet.

"You were probably both shooting the quail on the ground," I thought, "so I can't pity you much. After the doctor gets through with you, both of you may be more careful hereafter. Let us hope so, but probably you won't."

CABIA BLANCO.

ERIE, Pa.

A Disgrace to Virginia.

Editor Forest and Stream:

On Thanksgiving Day in this year of grace, 1902, I was in Princess Anne county, Virginia, in the vicinity of that small sheet of fresh water commonly known as the North Bay. About 2 o'clock in the afternoon we were alarmed by what appeared to be a perfect fusillade of musketry, as though the fiercest kind of a sham battle were being fought on the bay.

On proceeding to the shores of the bay, we discovered the cause to be a battue of that nondescript wildfowl locally known as "blue peter," and we beheld a sight which would incite to wrath every lover of animal life and cause a real man the utmost indignation. Several small, quick-moving sailboats would, as far as possible, surround a raft of blue peters and then close in as rapidly as possible, and open fire on the almost helpless prey. Each boat had two men in the bow to do the firing, and fire they did as fast as they could, so the din and the slaughter can readily be imagined. When the round up was finished by the boats reaching the shore, the boats would return under easy sail and pick up the dead, and when this was done the blue peters would be again sought and the performance repeated. Naturally, every living thing except the crew of the boats left the bay. Formerly this bay was frequented by large numbers of wildfowl, but owing to the above-described way of carrying on wanton destruction, as well as the continued use of batteries, wildfowl have been practically exterminated and a duck is rarely seen on this water. I am informed the same practice has begun on the Back Bay, and that batteries also are largely used there. It is safe to say that if some stop is not made and that right speedily, the wildfowl will be driven from that bay, and the once-famed shooting ground of the Ragged Island Club will be but a memory.

One remedy would appear to be simple. Let the Legislature prohibit shooting from boats and also authorize the appointment by a chief State warden or by the county court, of game wardens in every county, and let each and every gunner take out a license and the fees received from licenses be expended in paying the game wardens.

It certainly is the duty of the State to protect itself and its law-abiding citizens against such lawless acts and prevent such wanton and useless slaughter.

XPER.

Capt. John Travis.

From the Turf, Field and Farm, Feb. 29, 1868.

THE celebrated pistol shot of the United States being now in our city for a short time, giving lessons in his favorite art, our readers may like to learn something of the man and his remarkable feats. He is the winner of 108 consecutive matches, the distance he has shot in his different matches ranging from 10 to 500 yards, shooting altogether with a pistol. Some of our readers perhaps will recollect the great feat he performed in Louisiana in 1853, shooting at the first shot on a wager of one thousand dollars, a small orange from the head of Mr. J. P. Osgood. At the distance of twenty paces, another great feat of his at Niagara Falls was much talked of at the time. Monsieur Blondin, the renowned rope walker, was crossing Niagara River from the American to the Canadian side. When half-way across Blondin held out his hat, and the captain from the deck of the steamer Maid of the Mist, at the distance of 360 feet, shot a ball through the hat.

Adirondack Deer.

Editor Forest and Stream:

The deer season has ended, and as the snow is coming down as though it meant to stay, there is not much likelihood of any more deer news reaching the woodsmen till the crusting begins, which it does as soon as the crust is thick enough on deep snow.

It has been a pretty good year for deer. Ruffed grouse and woodcock were never so scarce in the valley of the West Canada as they were this fall, but it has been a long while since the deer were more plentiful around the clearings along that stream and its sister, Little Black Creek. Almost daily we heard that deer had been seen "up the road," or in somebody's pasture. Deer were seen eleven times in Johnny Bousefield's pasture, most of which can be seen from Northwood post office. Probably these deer did not number more than five or six individuals, however. A band was seen many times across the creek in Ohio. It began with five individuals, but diminished to three before the hunting opened. I saw a score or more of deer tracks where the animals had crossed the road up the creek within two miles of the stores here, and on at least two occasions two deer crossed the road together. One time, however, a dog was after a pair, judging by the track.

When the season opened, several deer were shot around Northwood and Wheelertown. A few were got in fair fashion, as they wandered at the edge of a clearing, but there are some hounds which can run deer still left in the country, and some of these did not grow fat while the hunting lasted.

But it is a fact known to every resident of the region that the number of dogs able to run deer is gradually decreasing, and that the violations of the law in this manner have fallen off more than in proportion. The constant reiteration that it is against the law, and that the State is liable to have a man up in this country has worried all who have poaching inclinations. The result is that hounding is no longer carried on in this neighborhood as it once was. In fact I do not know of a single race being run at Northwood this year.

But along Little Black Creek, numbers of deer have fallen ahead of hounds, or other dogs. Yet even there so much caution was used that none should run to West Creek, that only short run dogs were used for the most part, and so frequently after a circle or two in the woods, the deer shook its pursuer, and went free unseen.

It is a fact, however, that even this little hunting with hounds has kept the deer supply down a great deal. Unless it is stopped, still-hunting with any success in the wood lots is far from likely within three or four years. But the deer are increasing, around the clearings at least, in the estimation of the woodsmen.

One effect of the still-hunting law has been to make better woodsmen of the hunters who visit the deep woods. "We didn't know how to hunt them at first," Fred Jones said the other day, and so it was. Men who had of late years merely sat on runways and waited for the deer to pop into view found that the deer back in the woods was conspicuous chiefly as a flying white plume, with no particular place to aim at. Deer five rods away in the woods were a harder proposition as a target than one ten rods away on an open stream. Many men with long records of big bucks found to their amazement that they couldn't get any at all. They simply had to go to work and learn how to hunt deer, of which they had known practically nothing save that the animals fled to the water when pursued by dogs and that they followed runways to the streams.

In these days it is no longer the Gorge Runway, the Pine Tree, the Natural Dam, of which one hears of an evening at the store, or by the fireside in a camp, but of the Burning, the Beaver Meadow, the Mountain up next to the top, the Beech flat down the brook. The most remarkable and the best effect of the non-hounding law has not been that it saves the deer, but that it has compelled the men to learn woodcraft, to study the nature of the game and of the lay of the land.

Incidentally in the learning, men have had a widening of their personal experience. Of a party of ten men who went to Horn Lake this fall eight slept out all of various nights—at least ran around trees, for the nights were cold—because they could not find camp. They got in in the morning or by the next night in all but one case, and that man stayed out two nights. So too with a party of hunters up on Little Black Creek Lake. They were hunting, and two of them got lost. One fetched up at the Old Pardy Place nine miles away, and the other carried a deer to the North Branch, a matter of six or eight miles out of his course.

In my own experience I have been a bit more fortunate. I have not been out all night, but I found myself ten miles from my camp at three o'clock on a November afternoon. The way I hit for camp was record breaking. In just the ordinary course of a day's hunt, I have discovered lakes, mountains and brooks far from their natural resorts, and it was only with much effort and a compass, known to be perfectly reliable, that I was able to put them back in their proper places. I know from my own personal experience, as well as from listening to the tales of the woodsmen, that there is more real information to be had by the ordinary man from a day's still-hunting than from two weeks on a runway.

And the difference between sitting for ten hours on a log or rock, chilled, blinded by the reflected light of the sun, deafened by the roar of a stream and numbed by inactivity, from slipping through the woods exercising every muscle and the faculties and senses, is so great that to change back to the hounding would be to the disadvantage of the woodsmen, mentally at least; and to the city "sports" physically as well as mentally, though in the latter case not in so marked a degree, since sitting on a runway to the two-week or so wood dweller is sufficiently occupying to the mind in its novelty.

As to the accidents in which men are mistaken for game, we have had none of them in this locality. Nor do I know of a man's being shot at. But it might easily happen if any one were in the least careless. In the party I was with this fall, the two best woodsmen had experiences to make them shiver. They were hunting on a side hill, Will at the foot, and Fred half way up. Will saw a deer and fired. He was then at the foot of the hill. Fred heard the shot and in a few seconds, as it seemed, he saw the hind leg of the deer directly in front of him, on the hill side. Fred stopped instanter and waited for the shoulder to appear. In a few moments the leg moved along, and then Will stepped out from the brush. Nine out of ten hunters would have felt themselves justified in shooting when all the circumstances so clearly indicated a deer. A day later Will had a similar experience with Fred. He supposed Fred was on his right, but Fred was to his left instead, where he loomed through the woods like a deer, but by waiting for a clear view in both cases, a tragedy was averted. The gang I travel with begins to talk about being careful before the supplies are purchased for the trip, and not a morning comes in the woods but what mutual warnings are exchanged.

One reason why there are not more convictions for breaking the game law is neighborliness. Nobody likes to tell on his neighbor. One way to break the wholesale violations is to send a stranger to the district infested by the lawless spirit. Evidence could be had easy enough to convict half the citizens of some communities, but one conviction would make such a place "clean." Those who talk the most about law breaking are not always the ones who obey the law.

This fall a local paper came out with a tirade against hounders. Wilmurt needed the warning all right enough, but the man who gave it was indiscreet. He signed his name to the article. Just one week later to a day, I was driving to Noblesborough, through Wilmurt. I heard shots ahead, and on reaching the place, I met four men. Three of them were carrying a big doe, the fourth, the man who wrote, had four guns. The doe was wet, and had been killed in the water. A mongrel hound sported along with them. Of this same man it is told that he was on a runway—I've seen him so many times—watching for law breakers. A deer came along, and the man missed it, not once, but many times. Pretty soon the dog came along, and the watcher killed it according to law.

The laws ought to be enforced. There is no doubt about that. But to offer half the reward to a man's neighbor for betraying him, does not seem to be the best way of doing it. Nor are political appointees likely to be the most efficient. If game constables were elected and could be made to see the need of doing their duty, probably the game laws would, after a time, become as well observed as any other laws. But when government officials of various sorts—including judges, and lieutenant-governors, and the like, violate game laws, it looks as though it was just a case where liberal education and a fair sense of honor was needed. The trouble is further in the fact that when a man is in the woods, he is there to get away from rules and codes and business. Anything that suggests law and order are most distasteful to him. He wants to be "free," untrammeled. That is what he is there for, and one way of being so is to get out and shoot deer contrary to the law. With some it is just a way of showing that they are independent.

One sort of game is growing plentiful in spite of lack of protection. That is bears. There have been lots of them seen. Roscoe Conkling killed four one day, and saw eleven, in the Woodhull Lake country. He seems to have met a whole migration of them. He ran short of cartridges, or he would have killed—nobody knows how many more. Then Jim Macbeth saw a couple up at Noblesborough, and over at Wheelertown half a dozen or so were shot at. Their tracks were everywhere around the clearings. I saw three myself one day. I shot, of course, and missed. But it was worth missing to see the old one. She ran ten yards and then stood behind a big dead stub, and peeking around to one side of it, wondering what I was up to anyhow. With a rifle of low trajectory—a .30-30—I might have hit her, but it was a long shot. In other respects I have found my .45-90 entirely satisfactory.

The .30-30 is in the balance as regards local opinion. Many have used them here. Some tell about the awful holes they make, and others tell how they have had to put half a dozen bullets into deer before they could get it. When the bullets hit a bone, it is generally agreed, the effect is terrific. But otherwise a .32 would be as good. For our work here a .38-55 is plenty strong enough, and with that gun half the deer killed in this region are brought down. It is not unlikely that if more accidents occur with the .30-30 in proportion, it is because tenderfeet use them.

RAYMOND S. SPEARS.

NORTHWOOD, N. Y.

Virginia Duck Shooting.

CITY POINT, Va., Dec. 6.—Duck shooters who would like to come here and cannot, may comfort themselves with the reflection that their time would be wasted again this year, as it was or would have been last year. About the first of November, 1901, ducks appeared in their usual abundance, and for two or three weeks afforded excellent battery shooting. Then, owing to the scarcity of food, they "took out" and did not return, even in March or April.

This year's food conditions are very similar, and no river ducks have come at all, though there are some black ducks, mallards and sprigtails on the marshes, which are as a rule rented to private parties. The Belch boys have not even put their battery overboard, and their house-boat lies unused at anchor below General Grant's wharf—or the remains of it.

Mild weather is generally regarded as the cause of the absence of blackheads, redheads and canvasbacks this year, and a cold snap which may bring them is anxiously awaited.

J. L. K.

Ontario Deer and Hounds.

ONTARIO has some of the finest deer hunting in the world, and season after season we have heard fairy tales of how, thanks to the excellent game laws of the Province and their thorough enforcement, the number of deer, instead of decreasing, has been actually increasing, notwithstanding the invasion of the bush by hordes of hunters and hounds. The fact of the matter is that the number of deer is fast becoming smaller except in the more remote and inaccessible localities, and that they will be practically exterminated within a few years unless our boasted game laws are changed. The change that is wanted is the prohibition of hounding. This has been advised by the Government's Game Commissioners, as well as by others, but the pressure from the hounders and the butchers who murder deer in the water has been too strong, the game act remained unchanged and the slaughter has been unchecked. Even hounders begin to realize this and some of them suggest remedies such as limiting each hunter to one deer—anything but the prohibition of hounding. Let us hope that the Government will take action during the coming session. First let hounding be prohibited. This done, the hunters should be restricted to killing bucks only. This plan has been adopted in other countries with good results, and has been applied in Ontario to moose and caribou. Why not to deer also? It would not only help to keep up the number of the latter, but the necessity for looking for antlers might prevent the shooting of men in mistake for deer, and there appears to be no good reason why each hunter should not be allowed to kill two bucks if he can.

There are proposals to change the season, making it open later, as it is argued that venison is liable to spoil in the early part of November. Some may have spoiled during the season just ended, but it was exceptionally mild. However, no great harm would be done by having the season open later, nor, if hounding be stopped and none but bucks killed, by lengthening it by a week or ten days.—Canadian Champion.

In the Yellowstone Park.

THE usual amount of game has come down out of the mountains. Elk are very thick. I do not notice any particular increase in the number of antelope. I think coyotes and other animals have taken almost all the increase. There is a lot of sheep and mule deer. The sheep have done better than the antelope.

A mountain lion was killed about Nov. 25 in Gardiner Cañon by Scout Holt. It had just killed a coyote. Something new to us. Holt saw the kill made down by the river, which leads us to think the coyote had gone there for water and was sick. Possibly it had got hold of some poison. There is lots of strychnine out. The lion was taking the coyote up the side of the cañon when shot. If they would kill coyotes and not sheep they would be useful animals in the Park.

The wild things around here are getting very tame. Teams pass down within a few feet of them unnoticed. The other day the mail stage had to stop for a buck mule deer in the road. The team was afraid to go on, and it was some time before the deer would get out of the way. As it was the running season there was some danger from the buck. They are getting too tame. I told the driver, Morrison, to carry a lot of good-sized rocks on the seat to throw at the bucks when they would not let the U. S. mail pass. I have known mountain sheep to be very slow about getting out of the road.

The railroad is completed to Gardiner, by spring I hope to be able to sell out and move my roll of blankets to Seattle and Alaska. There is considerable snow here for Gardiner, about 4 inches. About 18 inches at Swan Lake flat, 12 at Mammoth Hot Springs, 3 feet between Norris and the Cañon. I don't see where all the game is going to get food this winter. Major Pitcher will feed the antelope when they require it. They range now from Gardiner to the first fence this side of Cinnabar.

T. E. H.

Black River Association.

UTICA, N. Y., Dec. 2.—The Black River Fish and Game Protective Association held its fifteenth annual meeting on Dec. 1, and many matters of interest to true sportsmen were considered. The report of Treasurer H. A. Pride showed the financial condition of the organization to be very satisfactory. Secretary W. E. Wolcott presented his annual report.

Resolutions were adopted declaring it to be the sense of the Association that the open season for deer should be from Sept. 15 to Oct. 31, both inclusive; that the sale in the market of venison, grouse, woodcock, squirrels, wild ducks, wild geese, snipe and plover, killed in New York State, should be prohibited; that the Legislature at its coming session should make a liberal appropriation for the purchase of additional forest lands in the Adirondack region.

The following officers were elected: President, William L. Fowler, Holland Patent; Vice-President, Ed. Robertson, Trenton; Secretary, W. E. Wolcott, Utica; Treasurer, H. A. Pride, Holland Patent; Directors: John W. Hicks, Marcy; Frank S. Fowler,, Oriskany Falls; John C. Thomas, Remsen; Ed. Robertson, Trenton; George G. Chassell, H. A. Pride, Ira L. Park, Holland Patent; Delegates to State Convention: W. E. Wolcott, W. L. Fowler.

W. E. WOLCOTT.

Pennsylvania Grouse.

SAYRE, Pa., Dec. 5.—Ruffed grouse are plenty in all the favorite covers of northern Pennsylvania. A good many bevies of quail are also reported. Gray squirrels were found in plentiful numbers and rabbits are everywhere abundant.

Mr. Benjamin S. Warner, of Sayre, a long-time reader of FOREST AND STREAM, and the owner of a Gladstone setter that is a sure enough meat dog, is just back from a week's outing at Browntown, Wyoming county, and reports quail more plentiful in that vicinity than for several seasons past. Mr. Warner hunted largely over posted grounds, and the shooting he enjoyed was of an exceptionally high class character.

Benjamin Stone recently made a double on ruffed grouse in a bit of shooting country just out of Athens that is somewhat remarkable and worthy of note.

A grouse arose directly in front of Stone, and on the instant he shot at this bird a second grouse flew into the exact line of fire, and both birds were killed.

If in the bright lexicon of sportsmanship there is such an existing fact as a cinch, then the lean and supple youth from the historic environs of Athens certainly acquired it on the occasion mentioned.

M. CHILL.

The Drum of the Grouse.

New York, Dec. 6.—*Editor Forest and Stream:* The interesting letter from Morgantown, W. Va., on "The Drumming of the Grouse," published in this week's issue of your valued paper, evokes in me the following pleasant recollection:

While eating a hasty lunch on the shore of one of Maine's loveliest lakes last October, I heard a partridge drum in the thick woods behind me. Having but recently entered the wilderness and not having yet indulged my first taste of ruffed grouse for the season, I quickly grabbed the gun and ran in the direction whence the sound was coming. Proceeding slowly and cautiously for 50 or 60 yards through the woods, I came to an old lumber road without having seen the bird, which by this time had ceased drumming.

Crossing the road, I soon perceived the cock standing on a large fallen log, and as I was about to raise the gun to my shoulder, the thought struck me that I might get the oportunity for which I had many times longed, of seeing a partridge drum.

I was then about 60 or 70 feet from the log, and by carefully walking in a crouching position, I succeeded in approaching, totally unobserved by the bird, within 25 or 30 feet from where he stood.

There I anxiously waited for what seemed to me fully 20 minutes, and which in reality was, I suppose, but one quarter of that time, when all of a sudden, the bird, which during this period had kept motionless, raised his head and neck, ruffled his feathers, straightened up his body in the same fashion as a rooster does when about to crow, and began striking the tips and edges of his wings, behind his back, very slowly at first, and gradually more and more quickly, until the noise and the extremely rapid motion fairly dazzled me for an instant, when suddenly the operation stopped.

The moral effect of this "virtuoso's" performance caused his life to be spared, and I withdrew to finish my interrupted repast, and incidentally stretch my cramped up legs, leaving him undisturbed.

Your correspondent positively asserts that the noise is produced by the bird striking the wings against his body; I only saw his wings strike each other.

However, it may be possible that "the many birds of his" acted differently from this "one of mine."

J. Oswald Jimenis.

A Settler's Close Call.

The practice of pit lamp hunting, or jack-lighting for deer, though illegal, is indulged in to a great extent by certain unprincipled poachers in this neighborhood. Although columns have been written in nearly every newspaper in the country, protesting against the evil practice, pointing out its dangers to man and beast, and giving accounts of the many fatal accidents resulting from that practice, yet there are men who still sneak out with their lamps and deadly long range rifles, in defiance of law, and in utter and selfish disregard of their neighbors' and their neighobrs cattles' lives, to shoot deer at night. Not so long ago a settler was arranging things about the stove, preparatory to retiring, he had turned around, and was about to step into the next room, when a bullet from somewhere outside, pierced the window glass, glanced off the stove, and went out through the other side of the house. Had the man not moved just when he did, he must have been shot. Of course, an examination out of doors failed to reveal anything. Night prowlers of this sort are in habit like sneak thieves, and so soon as they had become aware of the effect of their shot, they promptly "doused the glim." The settler referred to is saying very little, but it is extremely probable that there will be warm times in store for anyone he catches pit-lamping in that vicinity. Fool criminals of the jack-lighting class should, in addition to all the several penalties of the law, have their firearms taken from them and never allowed to again carry a gun.—Cumberland (B. C.) News.

Philadelphians in Virginia.

Philadelphia, Nov. 29.—As I passed through the gates of the Pennsylvania station here to-day the inspiring sight met my gaze of six men with as many gun cases filing through a neighboring gate, and well laden with sufficient hand baggage to indicate that six places of business would know their respective manipulators no more for some time to come.

Later, as the train moved out for the South and an overwhelming desire to "hit the pipe" came over me, I moved to the smoking compartment and found six gunners located there discussing the game of hearts. They could not play because the porter said "it was against the rules." The party consisted of Messrs. F. T. Patten, known to his immediate party as "Pop," certainly an undeserved nom de plume; N. B. Gaskill, as "Babe," (an ill-fitting sobriquet); W. A. Shreve, S. W. Beldon, G. W. Black (I was told that "W." stood for the real Washington), and P. F. H. Blakeley. They were bound for Virginia, duck shooting. I can only add that if they could overcome duck scruples as easily as "coon" scruples, they must have come home laden. T. E. B.

Forest Protection.

From the President's Message.

Few subjects of more importance have been taken up by the Congress in recent years than the inauguration of the system of nationally aided irrigation for the arid regions of the far West. A good beginning therein has been made. Now that this policy of national irrigation has been adopted, the need of thorough and scientific forest protection will grow more rapidly than ever throughout the public-land States.

Legislation should be provided for the protection of the game, and the wild creatures generally, on the forest reserves. The senseless slaughter of game, which can by judicious protection be permanently preserved on our national reserves for the people as a whole, should be stopped at once. It is, for instance, a serious count against our national good sense to permit the present practice of butchering off such a stately and beautiful creature as the elk for its antlers or tusks.

Sunning a Deer.

This is about as it came to me: "The sun was dipping rapidly toward the horizon when out from the cover of the timber, well down the lake, walked a splendid buck, to a point where the lilypads grew. My guide, a full-blooded Chippewa, first saw the animal and called my attention to it. Looking at the sun, he pointed to the canoe and whispered, 'Gun.' I mechanically and quickly obeyed, but as the canoe was pushed through the reeds it was pointed straight away from the sun and toward the deer. I was at a loss to know the meaning of such a course. The canoe was driven along through open water nearer and nearer to the deer. The wind was from the deer, which the Indian well knew before he made the start. Repeatedly the deer raised his head and looked our way, but only to resume his feeding. Although we were less than a hundred yards from him, he saw nothing. Our backs were to the sun. Nearer and nearer we glided along through the rippling water, and yet the deer continued to attentively look up and feed on.

"As we closed in upon him the guide whispered, 'No shoot yet,' and nearer yet we came, our backs straight against the sun, and when we were not fifty feet away, the guide having thoroughly demonstrated his wonderful (to me) experiment, said, 'Shoot now,' and as he held the canoe I planted a ball between the eyes of the staring buck, and he was mine."

Christmas Books.

The problem of Christmas gifts is one to which much thought is given each year, and the decision of the weighty question as to what shall be given is put off in many cases until the last moment, and the work of selection and purchase done in a hurry and amid much confusion, so that often the gift arrives after the eventful day has passed; to the great disappointment of the donor.

Among the convenient and useful gifts for Christmas none take higher place than good books, and for the readers of Forest and Stream and their friends, those published by the Forest and Stream Publishing Co. are peculiarly attractive. Such books should be ordered well in advance, so that they may be shipped before the rush of postoffice matter clogs the Christmas mails, and to each reader who may wish to make a selection the Forest and Stream Publishing Co. will gladly forward a free catalogue of its publications.

Among the books especially attractive to the big game hunter are "Camera Shots at Big Game," "Camp Fires of the Everglades," "American Big Game Hunting," "Hunting in Many Lands," and "Trail and Camp Fire." The man who uses the shotgun will be pleased by a copy of the "American Duck Shooting," "Field, Cover and Trap Shooting," Elliott's "Game Birds," or "Hitting vs. Missing," or by any one of the dog books by the great authorities, Messrs. B. Waters and S. T. Hammond.

For yachtsmen there are "Small Yachts," "Steam Yachts," "Yacht Architecture" and various books on canoe building, handling and cruising. "Fly Rod and Camera," "Fly Fishing and Fly-Making for Trout," and Dr. Henshall's "Black Bass" books appeal strongly to the angler; while there are miscellaneous books by R. E. Robinson, Mather, Mrs. Churchill, Grinnell and others, full of interest, and of useful information.

"I hear you had a gun stolen the other day?"

"Yes, and if the thief returns it, I'll give him the contents and no questions asked."

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in Forest and Stream.

A Series of New Salmon Flies.

Of all the branches of sport I have had the privilege of enjoying in the wide world—yacht racing, shooting in India, hunting, deer stalking, game shooting, dry-fly trouting, and many other forms—there is nothing to my mind so grand and so evergreen as salmon fishing with the fly, and yet there is no sport in which the final connection between man and success is less certainly understood or commonly accepted than is the sparking point in salmon fishing—the fly, or the vanity of man, an unsettled brain, or a high faculty of fiction; anyway, an admission that human science has not finally penetrated the mysterious nature of the salmon. It is even said that salmon themselves can be educated to hook on, but, if so, it must take time, and no sportsman cares to kill a very brown fish.

It is not my intention in the following remarks to meddle in any way with the beautiful and vast collection of marine biology called "standard" salmon flies, nor to pull to pieces the pet local concoctions of the river gillies; let them all be enjoyed by their slaves. My intention is to describe an exactly opposite plan, which I think will be appreciated and found quite effective by that large body of salmon fishers who fish as guests, as short time renters, or as ticket holders; in short, migratory fishermen who cannot spare the time, the brain exhaustion, or often the money to fully follow out the scientific use of the 200 pattern system. Long ago I kicked against that vast accumulation, but, of course, I started a little one on my own. To any expert angler, whatever his own system of fishing may be, I, with all deference, would say, before you decide *pro* or *con*, on the plant I am about to explain give it a level good trial; tie the flies and go out in company with another expert rod who will fairly work the scheme of scientific selections from the hundreds of patterns recommended from time to time, who will use one fly to rouse a fish and change to another to kill, or, perhaps, even stop and tie by the river a special fly to kill, while you merely shift once or so for size.

The old standard patterns kill well even yet, and will do so, and there is no reliable evidence that great novelties have displaced them, but that they need not be slavishly copied in all detail is commonly proved.

Without adhering to minute particulars of wing construction in coloring, which nine times out of ten fish cannot possibly see, he being right under the fly (see Fig. 1, middle position), I grouped the ordinary and the extraordinary patterns as to general color and their probable effect in water as they would be seen by the fish. In this way I finally arrived at four pretty distinct groups and one large indefinite lot. Then I set about to design a single fly to fairly command each group, viz., a dark heavy fly, mainly black, blue, and gold; a dark wavy fly, mainly black and silver and scarlet; a bright showy red and gold stiff fly; a light blue and silver cinnamon; and, finally, a light fly, distinctly yellow, red, and black, a combination I had found successful on many occasions in bright sun and shallow or low water. Whether such reduction of patterns is scientifically correct I care not; I find my kills on various and very different rivers have not fallen off. I rather think they have increased, but who can gauge salmon kills season by season? Nobody can. One result I do know is the comfort of having few and definite weapons to use.

There are about 300 different published patterns of salmon flies and quite another hundred local killers. Mr. Kelson's great book "The Salmon Fly," gives some 244 distinct patterns. Major Treherne, in the Badminton Library, gives a careful selection of useful patterns, fourteen in number.

Color, that is, in a general way, is no doubt important in certain colorings of the water caused by peat, road washing, and many other things, but in any river large enough to maintain such title the color of the water is susceptible of considerable changes; therefore so also as to the fly coloring to be used thereon. The surroundings of the pools on most rivers differ immensely—red cliffs and rocks here, green trees and slate colored rocks, and, on the same beat, some pools open, with gray shingle and green banks. The contention of some men goes as far as suggesting, even maintaining, that a river subject to all these changes of shore color and water mixture definitely demands one particular color in preference to others. Size is the main thing after general color has been decided for the particular circumstances. My box for a day's work, carried in breast pocket, holds sixty-four flies, that is, five patterns, four sizes of each, and three copies of each size—i. e., sixty flies, with space for an occasional trial bogie, said to be the *ne plus ultra*. In my tackle case I often carry, but seldom use, several old hairy things and curios to work off the fancies of gillies who may, on strange waters, mar your sport by not disclosing the catches if you do not pander to their fancy. But once you know the river ot beat go "pooh-bah," and stand by to have to give your own concoction as a pattern, to be unearthed to some future fishing guest as the thing for the river.

The salmon fly, as I have hinted, is to my mind merely a personal invention founded more or less on tradition and some success. The way to see the hollowness of the multifly system is to paint water-color drawings of as many marked patterns as your patience will permit and time allow. Draw them to one size, say one and three-quarter inches, hooks, each on a separate card, then place these on a clear table or the floor, shift about till you have grouped general leading color and tinsel in fleets. They will group as before described. Can you not get some five patterns of new conglomerations to cover the lot as far as fish are likely to know it? It has been my endeavor to rig up four flies to command these four groups, and to make them possibly simpler, less work to tie, less variety of material to carry about, and yet to have each a fly not too grossly different from the flies which salmon have always taken, and beyond these one bright yellow black "curio" for sulky fish in low water or in bright sun. I have now had several seasons of using these

flies and modifying them into simplicity, and I have had some very good sport with them. I have usually carried some of my old stock of standard patterns, and, when failing with the new ones over a fish, I have tried the regulars and even the river keeper's local pets, but usually with no better success than with my own; therefore, my old regulation stock is allowed to die out. Many regulation flies will cut up nicely when away from home, and will redress as one or other of the patterns I give; others are given to the kelts when it is evident that few or no spring fish are about, for I like to flog all day and chance it for a fresh fish, yet one begrudges beautiful specimens for such rough work as kelts give them.

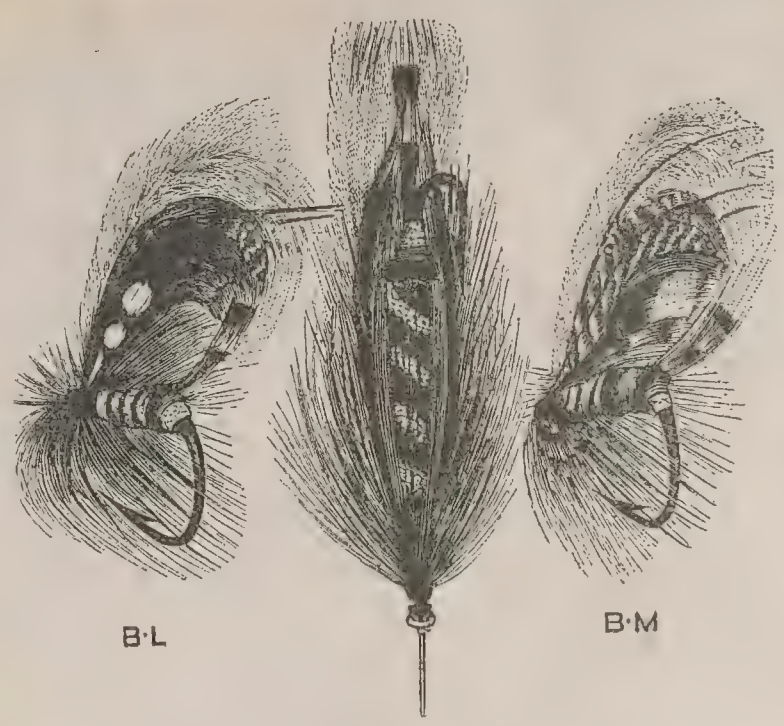
The fashion is to call each salmon fly by some name, just as is a ship or boat, no matter whether such name resembles a fly, a man, a trade, a rank, or even a king, so, in honor of the most reliable bit of male creation with which I have had the pleasure of being associated in connection with water, I name my first fly the Blue-Jacket—blue and silver, a light, go-anywhere fly. I have killed with it on all sorts of rivers; indeed, if I were forced to reduce to two flies, Blue-Jacket would be one of them. With the slight variation of jungle cock, instead of blue-jay, at sides, it plays the devil in almost any water, bright or heavy. The next leveler is mainly red and gold, the helpmate of the aforesaid handy man; this is the Red-Marine. But for heavier work and longer range we need artillery, so my No. 3, still sticking to the ship, is the Blue-Marine (Marine-Artillery), mainly dark blue and gold in his uniform. Then we come to the black and silver division, a large lot, mostly defaulters, having no particular character, useful for doing drudgery in any place in any weather, always logged on board ship as in the Black List. Finally there remains the yellow fly for sulky, sickly fish impounded in low water pools or tropical sun; this is Quarantine, the yellow flag.

The materials needed for making these flies are comparatively simple, and I have found that even a roughly built fly will kill. I am not going to describe the actual fly-tying; there are excellent books thereon, such as "How to Tie Salmon Flies," by Capt. Hale, and "The Salmon Fly," by Mr. G. M. Kelson. These give all the necessary instruction. I would only add that in tying my own flies I often depart from the school ways in making wings and in putting on hackles. I make numerous stop hitches and varnish them, so that if the fly gets ripped by a fish only small portions can come away, and often the wreck left will fish, and has fished, well enough to kill another. The cost of flies is much a question of the feathers used, so I buy whole skins now instead of a dozen or so of particular feathers. A golden pheasant skin contains, bar the hackle and sides, all the feathers necessary, but such things as mallard, turkey, jay, jungle, gallina, and Simla parrot are very inexpensive. The build of the fly may be varied, and should be. I have some patterns long, scraggy, and wavy, others of the same, but built stiffer, shorter, and deeper, so as to suit different pools.

I often tie any one of the flies with slight variations, just to anticipate fancy when picking out of the box. See, for instance, the Blue-Jacket. You keep to the general character of the fly, viz., blue and silver, a dash of scarlet about the shoulder, with light blue over at the throat. Then the wing a gray over a cinnamon general color. I do not think it matters much whether that wing is from any particular bird, nor whether it is made of mixed fibers, married strips, or strands. Do it as you find convenient, and with the handiest feathers, so long as it casts well and tows straight. In another way I vary the fly; sides may differ for different waters or daylights, such as putting on jungle cock instead of jay, or large, long jay instead of a little scrap. Failing having spare copies of either pattern, and being without the time, material, or conveniences for tying flies, a shop standard may be got for the time; match chiefly by body and hackle, and stand by to refit in next port.

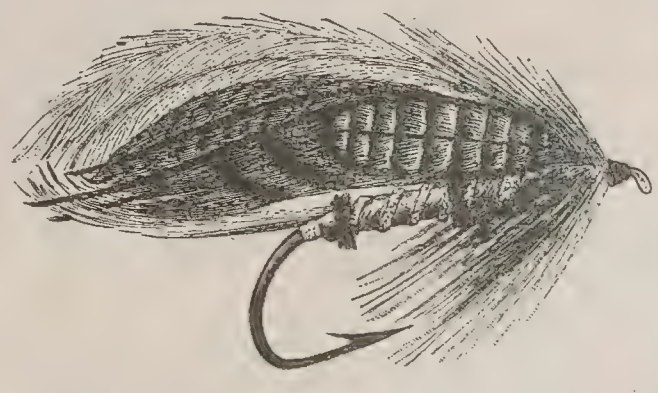
I have no doubt that my description, with the drawings, will be ample for the professional dresser, so that if any fisher likes to try my quaint conceits, he can order samples from his tackle man, and see how they look in the real. Here I will just touch a point which must appeal to the pocket, if not to the common sense, of those who only fish occasionally, not being regular, habitual river-siders—the pounds, shillings and pence. Taking the average cost of middle-sized flies on double hooks, shop made, with three or four toppings, they come to 2s. each. Now my five flies stand thus for a trip to a river: Five patterns in four sizes of each, and three of each size, comes to sixty flies to be taken; value £6. Taking Major Treherne's list of fifteen flies, in the same sizes, and spare numbers, we have 180 flies, at a cost of £18. But when we turn to the 244 separate standard patterns given in "The Salmon Fly" book, of course, there would have to be selection, and I give up such an exasperating puzzle.

Shape is much a matter of fancy. I find long wings cast best and tow far best. Give me a skinny fly in preference to one high-arched and full-winged. The drawings, of course, show more stuff than should actually be found in the fly, being descriptive, not portraits of flies. And the length of wing, of hackle, of tail, or of sides should be put in the actual fly as suits the dresser's fancy, unless the fisherman has his own ideas on the subject. The mode of building the wings, again, can be varied, even in one pattern of fly, so that, in the four sizes and three copies of each to be carried, almost any kind of water-run can be satisfied. Even some variation of dressing, much depending on the feathers one has handy, will not be harmful, even may be useful, so long as the general appearance of the fly remains as suggested. *Vide,* for instance, the Quarantine (Fig. 4), the back to back whole feathers can be golden pheasant sword feathers with longer jungle sides, instead of Himalayan pheasant red and spot hackles with short jungle at sides. Or, in the Blue-Marine, on some days and states of water I should, on personal presumptive precocity, prefer bluejay sides instead of the jungle cock sides; but I do not know that the salmon would, so I tie some with jungle. In the Red-Marine fly, probably a strip of scarlet and black-tipped Simla parrot between wing is as effective as are the two spot and black Himalayan pheasant red hackle feathers, projecting from between the four or two tippets in the alternative dressings. You may have plenty of sizes of the one, and but small amount of the other in your tying box store. Black-List can be harmlessly but sometimes usefully varied by gold pheasant scarlet sword feather in place of Simla red parrot, or red macaw can be put in; in short, we want some bright scarlet. As to Blue-Jacket, the only variation I make, or rather keep in the box for daily use, is as to the sides and the throat hackle. I think if I had kept a log record of kills, Blue-Jacket would stand at two for every one fish killed by the four other flies. Taking throat hackle first, I have found dark Prussian blue, almost black, very good on dull days; jungle instead of jay for sides on some waters; and, again, the largest pale blue whole jay, almost as long as the body, excellent as sides on a bright day. So, I say, tie what you like so long as you have the distinct changes, and instead of buying a microscope to examine your flies with—or more probably for the purpose of criticizing some other fellow's flies—expend that money in new sound gut casts. One word more as to build before I state the formal dressings. Except in rare circumstances, I believe that toppings make the fly. On a bright day toppings disclose the fly at a distance, acting as a heliograph to the fish to come and inspect, and the body and hackles do the trick with the overhang of the toppings. This overhang is about the only part of the wing that the fish can see after the fly comes over him in deep water. In shallow water a side show, in addition, is useful, but its minute nature, I consider, is immaterial beyond general tone (*vide* drawing of fish vision for medium depth water). On a dark, black, windy day toppings are of less value. Black on red is your game if you want salmon in hand.



FISH'S VISION
Fig. 1.

Now the bugle sounds for dressing. I give the formal names, as I suppose they may indicate the make-up; but by "shoulder" I mean the place for a hackle wound round just under the wings; by "throat" is meant between head and wing—a neck hackle.

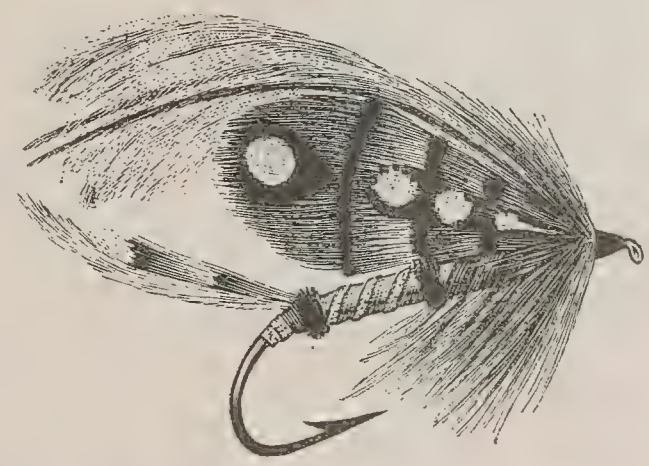


BLUE-JACKET
Fig. 2.

THE BLUE-JACKET (Fig. 2).—Tag: Silver, and light blue silk. Tail: Topping and light blue fibers. Butts: Bronze peacock herl. Body: In two parts, silver tinsel flat and ribbed, or embossed silver, then light blue silk ribbed with silver, and a bright cardinal red dyed hackle run down it. Wings: Two strips of any light brown or cinnamon turkey, mottled, or zebra mottled gold pheasant tail, two strips of gray mallard (for choice) over, and two long toppings. Sides: Whole jay, pale blue feather; vary size in different flies, even to extending the length of the body; in some small flies put jungle instead. Horns: Two scarlet at mid-wing outside, and two blue macaw over the mallard. Throat: Very light blue, dyed hackle, long, and wound round. Head: Varnished black.

In regard to dressing, I have found that in the very small sizes it is well to tie the body all in the silk of the pattern, and rib it with tinsel, instead of dividing the body; and also, in such case, to run the first hackle right up the body in some flies, to somewhat veil the tinsel where the water fished is very clear.

Blue-Jacket, Blue-Marine and Black-List can usefully be tied in two natures—stiff, deep, and short winged, and long, scraggy, wavy, long hackled. The other two are always stiff flies, whole-feather make.



RED-MARINE
Fig. 3.

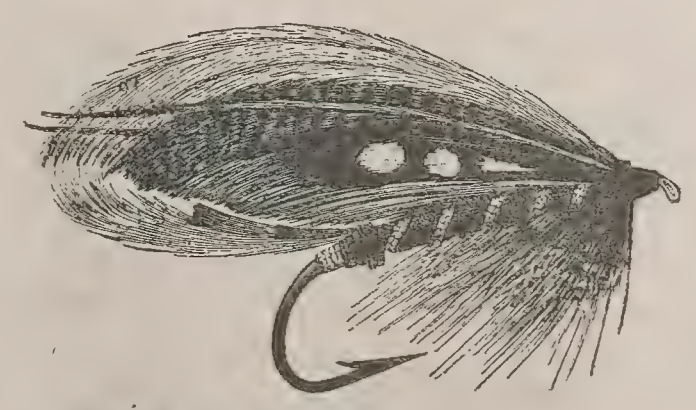
THE RED-MARINE (Fig. 3).—Silver, with scarlet or claret silk. Tail: Topping, with tippet strands. Butts: Bronze herl, or green herl. Body: In two parts; first, gold with silver ribbing; second, cardinal red, or nearly claret, silk with similar color dyed hackle down it, and ribbed with gold. Wings: Two Himalayan pheasant red hackles with white and black spot, set back to back, projecting well from between two or four tippets, in latter case lapped to form three black bars a side; or, alternatively, a broad strip of red and black tip Simla parrot; or a golden pheasant scarlet sword feather in place of the Himalayan spot hackle, and a couple of strips of mallard over this, three or four toppings over all. Horns: Two scarlet. Throat: Hackle light blue, dyed, wound round. Head: Varnished black.

QUARANTINE.
Fig. 4.

THE QUARANTINE (Fig. 4).—Tag: Silver, and blue silk. Tail: Two toppings. Butt: Black herl. Body: Black silk, or fur, or wool, ribbed silver tinsel and lace. Hackle: At shoulder bright yellow golden, such as macaw. Wings: Two Himalayan pheasant red hackles, white and black spot, back to back (or gold pheasant scarlet sword feather, or ditto two breast red hackles, or red macaw fibers, etc.), four or five toppings over. Sides: Jungle cock, two or three spots. Two horns of green peacock herl. Throat: Spotted guinea fowl, dyed bright blue, or, in small sizes, bluejay for hackle.

BLUE-MARINE.
Fig. 5.

THE BLUE-MARINE (Fig. 5).—Tag: Silver, with blue silk. Tail: Topping with tippet strands. Butts: Black herl. Body: In two parts; first, gold flat or embossed, ribbed with fine silver; then second, dark blue silk, ribbed with silver oval, with blue dyed hackle down it. Wings: Long tippet strands (or red macaw), close long body, two wide strips black turkey with white points, narrow strip (or several strands) scarlet, such as Simla parrot, macaw, etc., two strips narrow brown mottled turkey, or zebra mottled gold pheasant tail, and brown mallard over (in smaller flies only the brown mallard is enough over the scarlet); two toppings over all. Sides: Bluejay, or in some put jungle. Horns: Scarlet over the wing side, and blue macaw over all. Shoulder: Guinea fowl spotty hackle, dyed dark blue, almost black; bluejay in small sizes of flies. Head: Varnished.



BLACK-LIST
Fig. 6.

THE BLACK-LIST (Fig. 6).—Tag: Silver, and red silk. Tail: Topping and tippet or scarlet fibers. Butt: Black herl. Body: Black silk or fur, ribbed with silver. Hackle: Scarlet from second turn of tinsel. Wings: Scarlet, next body (such as Simla parrot strips, macaw, scarlet sword feather, or tippet), over such two good strips black and brown dark turkey, cinnamon ends; darkest brown mallard stripes over, and two or so long toppings. Sides: Long jungle on line of turkey. Horns: Scarlet just above, turkey outside, and, in large flies, two blue macaw on top. Throat: Very dark blue, dyed, spotted gallina, or in long scraggy flies a long black hackle, and in quite small flies bluejay for throat hackle. Head: Varnished black.

Also, I have found very small flies of the above five patterns, but simplified to a mere likeness in the dressing, are fine killers of sea trout and large lake trout. The hackle here called cardinal red is somewhat difficult to describe; it should be toward claret, but yet decidedly on the scarlet side. Ramsbottom, of John street, Liverpool, has hackles just the color that I fancy; also, I find them, and the blues, in hackle-feather picture brooms obtainable at the stores.

In very low water and bright sun small jay or blue

chatterer seems to be better as sides than jungle; it may, however, be men's fancy, but I have killed with no sides on the fly. This fly is just the Doctor fly for fish penned in by low water, hence getting sickly or brown; but as a rule true sportsmen do not care to go for potted fish, and would rather leave them in quarantine. But sometimes this fly is a snooker in shallow necks of pools, with the whole-feather wing; anyway, it is well worth a trial when Red-Marine fails (perhaps mere fancy from a success), and the more brilliant the sun the more would I use Quarantine in preference to Red Marine; but not in all places. Black-List, also, is a good sun fly in very deep pools.

In the words or thereabouts of Patent Office, common form, "having now described my invention and the manner in which I work it," and having covered all possible future enlargement and all previous anticipation, I may as well finally say I claim no invention, no monopoly, and no particular cudos. I have merely endeavored, for my own benefit in the sport, to concentrate the sound virtues of several hundred flies into five. Others, I know, have worked in the same line, but, I believe, on standard patterns. Such men will be interested with kindly feeling toward my foregoing remarks.

W. Baden-Powell.

Jew Fishing Extraordinary.

Ingleside, Texas, Nov. 30.—*Editor Forest and Stream:* While waiting for a howling wet norther to abate, and (from necessity) "remembering the Sabbath day to keep it holy," I take the opportunity to send you a few lines descriptive of some extraordinary jewfishing, which was done about a week ago at Tarpon.

About sun-up on Sunday, Nov. 23, I noticed a small crowd of men and boats at Point of Rocks, some four hundred yards away. This I interpreted to mean that the roe mullet were running and that the jewfish were after them, a condition of affairs which we had been anticipating for several days, and to which the sportsmen had been looking forward with considerable eagerness and pleasure, especially because the tarpon fishing had been letting up somewhat, and we were anxious for some other sport to take its place.

Turning my eyes seaward, I saw approaching the entrance to the harbor a small two-masted schooner, which I surmised to be the Flower of France, a vessel for the use of which, during the month of December, I had been negotiating for a couple of weeks, and whose delayed arrival at the Pass had been causing some uneasiness because of a terrific norther that had struck the locality a few days before.

There was just about sufficient time for me to collect my tarpon tackle, hustle out my boatman and get to the channel so as to head off the vessel. When I reached Point of Rocks I found there two sportsmen with their boats and several of the unemployed boatmen, all fishing for jewfish in the midst of a great, continuous school of roe mullet. Two or three jewfish had already been landed, and two more were hooked, while I paused for a few minutes to view the sport, but I could not remain to see them landed, as the Flower of France was approaching rapidly.

Hailing her, they threw us a line, then I went aboard and got the captain, Mr. Ray Dunbar, of Matagorda, to heave to while we concluded our negotiations, after which the vessel proceeded on her way to Rockport, and I joined the other fishermen. However, I was just in time to be too late, as the eighth and last jewfish of the morning's catch was landed soon afterward, while I failed to get a strike. At nine o'clock the fishing was practically over for the day, although two market fishermen, who spent the rest of the day fishing at the Point, landed two more in the afternoon.

The average weight of the ten fish caught that day was probably about 350 pounds, as there was only one small one in the lot.

Up to this time the world's record for weight of jewfish landed on a rod was 435 pounds, the fish having been landed at Tarpon a year or two previously. The record jewfish of the Pacific coast weighed 415 pounds.

The largest fish landed this first day on a rod was caught by a young gentleman from Cincinnati named Joseph. It was about six and a half feet long, and the formula made its weight 401 pounds. There were two other fish landed on hand lines that were a very little larger than this.

Next morning before daylight Mr. Joseph, Mr. Sea, of Independence, Mo., and I, who were all the sportsmen then at Aransas Pass, were at Point of Rocks with our boats and boatmen; and, in addition there were half a dozen of the natives with their boats and hand lines.

Soon after sun-up the jewfish began to strike, and the fun waxed fast and furious. It was not long before I was attached to one, which in a few minutes I hauled on the beach, as it was a little fellow of 50 or 60 pounds' weight. I had not more than gotten my line into the water again before I hung another. My boatman for the time being was Mr. Robert Farley, the taxidermist, who had offered to row me that morning for the express purpose of trying to break all records. When he saw that I was again attached, he yelled, "sock it to him," which I proceeded to do. Meanwhile, Farley had taken up the anchor (for all of the boats were lying at anchor close to the rocks with their sterns pointing outward into the stream), and had shoved us off so as to clear the other fishermen's lines and get out into deep water, where the fight could be fought to a finish without interference of any kind. It soon became evident that our fish was a monster. Fortunately my tackle was all new and of the very best, and the line was doubled back some 20 feet; but we then noticed for the first time a discolored spot in it just above the long loop, which gave us some uneasiness. Our fears, however, were unfounded, as the line did not part.

After about fifteen minutes of the hardest kind of fighting, we got the fish to the surface where we could see it well enough to judge of its size. Farley remarked "that fellow is a record breaker; be careful you don't lose him."

It was one thing to get the fish to the surface, but quite another to keep it there, as it continued to sound for the next ten minutes, during which time my new ribbed-leggings that I suggested in a previous communication in your columns, stood me in good stead, enabling me to bring a great uplift on the fish without any severe punishment on my legs.

By this time the monster had begun to show signs of fatigue, and I at last succeeded in turning it belly upward, so we began to tow it to land, heading for Point of Rocks so as to give the rest of the crowd the benefit of the excitement. When we reached shoal water, Farley jumped overboard to haul the fish ashore with the gaff; but the creature then took a new lease of life by rolling over and striking out for deep water. In an instant Farley tumbled into the boat again and grabbed the oars, I shouting to the other fishermen to get their tackle out of my way, as our quarry was striking out over several of their lines. Fortunately, though, we did not foul any of them; and I managed to stop the run without letting out a hundred feet of line, so it was not five minutes more before we again had the fish in tow, belly upward, and headed for the shore. This time the great brute grounded on the sand, and was hauled immediately by the gaff hook far enough up on the beach to prevent its escape; then a slit was cut in its lower jaw, and a heavy rope was run through and tied, thus bringing the fight to a close, much to the relief of all concerned. Farley immediately made the measurements of length and maximum girth, which proved to be respectively 7 feet 3 inches and 5 feet 9 inches. The formula for these dimensions makes the weight 518 pounds, and before it was computed Farley, who has weighed many jewfish, declared that it would weigh over 500 pounds. Unfortunately, there were no means at Tarpon of weighing such a heavy fish. We kept it alive for two days, then had it hoisted on to the deck of the mail boat and carried to Rockport, where the scales made the weight only 450 pounds. Farley declares that the two days without food in the water and the drying out in transit reduced the weight fully 50 pounds. Be this as it may, and calling the weight only 450 pounds, Mr. Farley and I can now claim the world's record for jewfish landed on rod.

While I was struggling with my big fish, Mr. Joseph hung one but little smaller, and landed it in about half an hour, his boatman being Mr. Will Farley, a brother of the taxidermist. These two men, by the way, are certainly the best all-around boatmen and tarpon oarsmen in the settlement, but Mr. Robert Farley very seldom can spare the time to row. Occasionally, as a special favor to an old friend and shooting companion, he rows for me. He is a first-class sportsman in both fishing and shooting, and makes a point of studying the habits of the fish and game which he pursues. Mr. Joseph's fish measured one inch shorter and 4 inches less in girth than mine, and the Rockport scales made it weigh some twenty-five pounds less.

Mr. Sea landed that morning a fair-sized jewfish, and the hand-line fishermen secured two more, making six for the morning, and sixteen for the two days.

If this kind of sport can be beaten at any other locality I would like to learn where. Every November there are two or three days' run of jewfish at Tarpon, and during the entire tarpon season, which begins on April 1 and is supposed to end on November 15, occasional jewfish are caught on both hand lines and tarpon tackle.

That the tarpon do not always quit striking about the middle of November, I proved this season by landing one at Point of Rocks on the evening of the 24th inst., and another at the same place the next morning.

It would be difficult to conceive of a more delightful resort for anglers than this. The drawbacks are few and often there are none. Sometimes in the autumn, especially when there is an unusual amount of rain, as was the case this year, the mosquitoes are vicious and specially poisonous; but in the summer there are seldom, if ever, any.

As a rule, the people frequenting the place are companionable and agreeable, but for the sportsman there is very little time to devote to social functions, as there is fishing during all the daylight hours, and as tackle repairing demands a portion of each evening.

As soon as I can find an opportunity to write it, I shall send you my promised letter on "Fishing for the Leaping Shark."

J. A. L. Waddell.

Some Maine Records.

Editor Forest and Stream:

Having just returned from a four months' trip to Maine, I take the liberty of submitting my following fish and game scores, which may compare favorably with other records of the same order made in the State during the year of 1902:

Score of large square-tailed trout made with fly and troll from Deer Island Home, F. L. Gardner, proprietor, Moosehead Lake, Aug. 8 to Sept. 27, weight as follows: 6¼, 4¾, 4½, 4¼ pounds, 4 pounds 2 ounces, 4, 3¾, 3½ and 3 pounds.

My son, Master W. Chambers Young, age twelve, took on the fly a trout of 5 pounds 2 ounces, which I think was the largest trout on fly caught during the year.

Game record while in camp at Ragged Lake, Oct. 1 to Nov. 2, Bert Duty, of Greenville, guide: One moose, spread of head, 47 inches; two black bear, two large bucks.

Moosehead Lake and the surrounding country is full of fish and game, and I feel that I have been particularly fortunate in enjoying the hospitalities of the Deer Island home, and securing the services of Mr. Bert Duty, who is one of the most reliable and best guides in the State.

W. B. Young.

All communications intended for Forest and Stream should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Size and Age of Fish.

Editor Forest and Stream:

It is difficult for a writer without books to collect information concerning the relation between the length and the age of certain food and game fish. The writer has examined the revised "Manual of Fish Culture" of the U. S. Fish Commission, and the "Transactions of the American Fisheries Society of 1902," and has obtained the following notes, which may serve to introduce this important subject. The notes are arranged in the order in which the fish appear in the most recent ichthyological books.

Atlantic Salmon.

In two years the Atlantic salmon reaches the length of six or eight inches in captivity. Adult salmon are thought to be four years old

At the Craig Brook Station, in Maine, mature fish measured from 29 to 31 inches in length, and weighed from 9 to 12 pounds. An occasional fish 35 or 40 inches long, and weighing much more, was taken.

Salmon weighing from 9 to 12 pounds furnish from 6,000 to 8,700 eggs each, but fish measuring from 35 to 40 inches yield from 16,000 to 20,000 eggs.

Landlocked Salmon.

It is assumed that this salmon becomes mature at the age of four years. At the spawning season the average weight of males is four or five pounds, and of the females a pound less.

Specimens of 12 to 14 pounds weight are not rare, and one weighing 25 pounds is recorded. The Union River fish are of about the same size.

The St. Croix fish vary in weight in different parts of their range, but the average weight of either sex at Grand Lake Stream is a little less than three pounds; individuals above 6 pounds are rare, and none over 10 pounds is recorded.

At Green Lake, Maine, in 1899, the average of 69 full-roed females was: Length, 25 5-10 inches; weight, 7 8-10 pounds. The males averaged as follows: Length 22 3-10 inches; weight, 5 pounds. One female was 30 inches long and weighed 11 pounds 6 ounces. One male was 31 inches long and weighed 13 pounds 8 ounces.

Rainbow Trout.

In Colorado lakes, where the water becomes moderately warm in summer and food is plentiful, this trout reaches 12 or 13 pounds, fish of this age being from 25 to 28 inches long. In the Au Sable River, Mich., the rainbow attains to a weight of five to seven pounds. In their native streams of California, rainbows are often caught ranging from 3 to 10 pounds, but averaging 1 to 2 pounds.

The largest rainbow ever produced in the ponds at Wytheville, Va., and fed artificially, weighed 6½ pounds, but many others of the same age in the same ponds weigh from 1 to 3 pounds. Superintendent Seagle states the average growth of rainbow trout under favorable artificial circumstances is as follows:

One year old, from ¾ to 1 ounce; two years old, from 8 to 10 ounces; three years old, from 1 to 2 pounds; four years old, from 2 to 3 pounds.

These trout grow until they are eight or ten years old, the rate of growth diminishing with age.

Brook Trout.

According to the experience of Superintendent Frank N. Clark at Northville, Mich., this trout, under favorable circumstances, reaches an average weight in the first year of ¾ ounce to 1 ounce; in two years it weighs from 8 to 10 ounces; in three years about 1 pound.

Lake Trout.

According to the same authority, at Northville, Mich., lake trout artificially reared in from 10 to 12 months after hatching measure from 4 to 8 inches in length.

Shad.

Observations made at Washington, D. C., during a period of years show that shad hatched late in April reach the length of from 4 to 9 inches before they leave the river, late in November.

Black Bass.

At the age of five or six months the young measure from 4 to 8 inches, according to locality and food supply, though some individuals reach a much larger size by preying upon smaller fish, not excepting their own kind. At Neosho, Mo., a black bass which was known to be under 18 months old weighed 1 pound 9½ ounces.

Rock Bass.

At the age of six months the fish seldom average 2 inches in length, adults usually weigh from ½ to ¾ of a pound, occasionally reaching 1 pound, and an individual taken in a river of Virginia was reported to weigh nearly 3 pounds. This bass may reach maturity at 2 years.

Crappie.

This fish and the strawberry bass, when adult, range all the way from 1 to 3 pounds in weight. At six months old the young of both species are about the size of the black bass of the same age, or a little smaller. Some individuals in each school will be larger than the majority.

Mackerel.

At maturity mackerel vary from 12 inches to 20 inches in length. Fish 12 inches long weigh from ¾ to 1 pound, while a mackerel of 20 inches may weigh from 3¼ to 4 pounds. The age is uncertain, but is supposed to be three or four years.

Cod.

According to observations made in Massachusetts, the following relation exists between the age, length and weight of the cod:

One and one-half years, 9 to 13 inches, 7 to 8 ounces; 2½ years, 18 inches, 2 to 2¼ pounds; 3½ years, 22 inches, 4 to 5 pounds.

The largest cod on record from New England weighed

211½ pounds, and was over 6 feet long; it was caught on a troll off the Northern Coast, in May, 1895.

Flat Fish.

This is also known as the winter flounder. The usual length of the fish is from 12 to 15 inches, and its weight about 1½ pounds; rarely fish measuring 20 inches and weighing 5 pounds are taken.

This is a very prolific fish, over a million eggs having been deposited by a large female.

This is a subject of very great interest and value, and the writer trusts that the suggestion of FOREST AND STREAM that observations bearing upon the relations of the age to the weight and the size of fish will be furnished freely by fishculturists and naturalists who have the opportunity to obtain information.

TARLETON H. BEAN.

A Game Tarpon.

Editor Forest and Stream:

Some time ago I promised to send you a description of the finest tarpon fight that I have ever witnessed. It occurred one afternoon last month out on the Gulf of Mexico, beyond the end of the jetty at Aransas Pass, when Mr. L. G. Murphy, of Converse, Ind., and I were there on tarpon fishing bent.

I had just succeeded in bringing to boat a fine six-footer after a longer struggle than usual, owing to the fact that I had completely drowned the fish before taking it in; and, while the boatman was baiting my hook for another trial, I sat watching Mr. Murphy's boat, which was only a few yards distant. Suddenly there was a strike, and a heavy-looking six-footer leaped into the air over twelve feet high. A few seconds later it made another leap fully as high, then a run, and instantly afterward another jump of the same height. In all it made six jumps, and not one of them was less than twelve feet high.

The ordinary height which a tarpon jumps is from eight to ten feet, and generally each leap is a little lower than the last, till finally the fish is unable to spring entirely out of the water. Once only before had I seen a tarpon jump so high. It was on my line in the Panuco River, near Tampico, Mexico. Unfortunately, that fish threw out the hook at once, so I did not have an opportunity to learn whether it could keep up its record on jumping.

Mr. Murphy, who is a powerfully built man and both muscular and active in spite of his sixty-odd years, handled his fish with much skill and apparently the greatest ease, bringing it to gaff in fifteen or twenty minutes.

It proved to be six feet one inch long by thirty-nine inches girth, which would make the weight by formula 139 pounds.

Mr. Robert Farley, the well-known and skillful taxidermist of this place, has mounted the fish, and is going to present it to the Tuna Club of Catalina Island, and in exchange the said club is going to send a mounted tuna.

The catching of this wonderful leaper brought up the question of the relative merits of tarpon and tuna as game fishes, and Mr. Murphy and I both agreed that no fish could improve on the fight which the one under discussion had put up.

In a year or two, after I have had some experience in catching tuna, I shall have something further to say to you on the question of which of the two is the king of all game fishes. In my opinion, though, the leaping shark will give both the tarpon and the tuna a close call for supremacy. I have had considerable experience of late with the leaping shark, but of this more anon.

I continue obtaining by personal experience valuable data concerning tarpon tackle, and, as soon as I can spare the time, shall send you my promised letter on that subject.

J. A. L. WADDELL.

Wading for Goldfish.

WHEN they found it necessary to build an annex to the Auditorium Annex in Chicago, they conceived the idea of building a lounging and drinking room that would make the hotel famous around the world. I am told $100,000 was spent upon this room. They call it the Pompeiian Room. I will not go into a detailed description of it in this article, further than to state that to the left of the center of the room, surrounded by fluted Carara marble pillars, is an electric fountain emptying into a tiled tank of large dimensions, in which hundreds of goldfish swam in schools around the fountain.

Football enthusiasts and others, after perhaps too generous attention to the fluid courses of their dinners, have boldly jumped into the angry lake and fruitlessly chased the nimble and elusive fish. This has become so common of late that Mr. Southgate now has a life-saving corps of husky porters always at hand.

And all this reminds me. Back of our country place on Long Island, where as a boy I spent my summers, lived a neighbor on whose farm was a large pond well stocked with goldfish, eels, etc. He had cut a small drainage canal from the pond to a field a couple of hundred yards away, where a pit had been cut about thirty by thirty through the solid clay. The water in this pit was murky, about two feet deep, and alive with young goldfish that could be readily seen swimming about.

I had a young cousin who lived in Brooklyn, and save for his annual visit with us in the country, was cooped up between bricks and mortar for the balance of the year. A city boy, full of life and spirits as a thirteen-year-old boy should be.

As the day rolled around for his visit, he appeared, appareled in just such attire as a fond mother would clothe her boy when going visiting—in fact, I think he wore nothing inferior to his best Sundays. Stopping at the house only long enough to give and receive his greetings, we started on a general survey of the premises, and after the barn had been inspected and the various fruit trees sampled, we wandered further afield and came to the clay pit with its swarms of golden fish. The sight was too much for that boy; he simply could not stand it. He had seen goldfish in the aquariums in the bird stores, but to see millions of goldfish to be had for the taking was simply nerve-racking. With an, "I'll be back in a minute," off he ran like a jumped deer—and within half an hour returned with a mosquito net window frame taken from the kitchen window by force of arms, and the family coffee pot. Without further ado he removed his coat, shoes and stockings, and rolling up his pants and shirt sleeves, slid down the clayey, slippery bank, and holding the mosquito frame in front of him fairly scooped up the young fish. The miraculous draft of fishes was not repeated for at the first scoop he got enough fish to fill the coffee pot twice over. That the boy did not think of the family wash tub and bring that with him was a source of poignant grief to him. It was certainly a case of embarrassment of fishes, and with frame in one hand and coffee pot in the other, he longingly looked back upon the fish still there "by the million," and thought nothing of his clothes and person, most generously smeared with clay and slime. His aunt had come from town with him as his custodian, and I will long remember the meeting, the boy on his side bubbling and bursting with excitement and having no thought of else but his prizes in the coffee pot, and on the other hand the aunt bordering on and gyrating between surprised muteness and indignant hysterics.

I have experienced enthusiasm myself in life at various and sundry times, but I question if I ever had it as badly as did Frank and his wonderful haul of goldfish.

CHARLES CRISTADORO.

She Goes Fishing.

MY uncle, who is eighty-three years old, was induced by me—one of those girls that delight in all outdoor sports—to go for a day's fishing on the river.

The bass were plenty in the Susquehanna, and from all reports also biting well.

Now, Uncle was a great fisherman, usually coming in with an empty bait box and an equally empty fish basket—but still his enthusiasm was always great, and the immense fish that he lost and the many bites he had were truly remarkable.

For a long time this fishing trip had been planned, so one morning when the wind was in the south and clouds were overhead, our preparations were begun. Of course the nearest creek was first visited for minnows, when, after a struggle with brush, ditches, tangled lines and the loss of several hooks, we succeeded in capturing six, which, by the way, were nearly large enough for eating.

Well, we were tired with this attempt, and a little bit discouraged, but we at least had the consolation of knowing where to get some worms to finish out for bait.

Finally, about noon, we were on our way to the river, which was about a quarter of a mile away. Uncle was laden with the minnow pail, two anchors and the fish poles while I had the bait box, lunch basket and an umbrella. We were indeed well equipped.

After securing a neighbor's boat, we had to fix the anchors and rig the fish poles, and as it was now long after noon, we concluded to eat our lunch. This task was soon completed, and we were at last on the water. At the mouth of a small creek, which Uncle said would be a fine place for bass, the anchor was dropped and fishing was commenced.

We found that the minnows were all dead, as the pail leaked and the water had nearly all run out, so we had to use worms for bait.

I had just thrown my line in the water, put up my umbrella (the sun was now shining), when, jerk went something at my line. Of course I at once pulled it up, so quickly, in fact, that my umbrella went handle down in the river, and with my pole Uncle's hat was knocked from his head and went sailing serenely down the Susquehanna. We pulled anchors with all haste and were away after the floating articles.

After a ten-minute chase they were captured and put up in the boat to dry, and we were again ready to fish—but, oh! what did I catch? It was merely an old root which took me about ten minutes to free from the line.

Uncle had a very short, slender pole, with which he was fond of throwing a long line. After fishing for about half an hour without even a bite, he concluded that he had too short a line, and at once unreeled about fifty feet or more and attempted to throw it; vain attempt—the line was wound around my pole, one anchor and both oars, and in the struggle the bait box was knocked into the river, where it immediately sunk.

No, Uncle was not provoked, merely nervous; so nervous that a very vigorous jerk which he gave to free his line, left his pole broken above the second joint.

It took us only a short time to get home, and when I go fishing again I shall sit on the shore and fish for shiners. Uncle will have to put in a new supply of fishing tackle, and when next he goes he will doubtless consider it more profitable to go alone, or if he takes me, to at least teach me how to pull in a root.

MABEL A. COOK.

The Aquarium Sturgeon Dead.

DEATH has again visited the Aquarium, and this time the victim is the huge sturgeon. The great fish—she was 8 feet 9 inches long and weighed when in good health nearly 300 pounds—succumbed to tuberculosis. She had been ill a long time, and so far as is known had not touched food in months.

The sturgeon was one of the finest specimens ever on exhibition in this city, and was acquired by the Aquarium June 3, 1901, from a fisherman of Bay Side, L. I., who netted her a short time prior to that date. For months she swam round and round her tank, always going to the right, and never, so far as visitors could judge, stopped to rest. Of course, there is no way of telling, but Mr. Spencer thinks that homesickness had a great deal to do with the fish's death. She always seemed to be hunting for a companion.

Several months ago the fish showed signs of illness, and all the books on fish diseases were consulted in the hope of diagnosing her case. She rapidly lost in weight, and Mr. Spencer and his assistants believed that the great sturgeon had consumption, a theory that proved true when the autopsy was performed last week.

Sturgeons are known to be restless in captivity, and there is no record of a fish of that species ever having been in confinement that did not suffer from apparent homesickness.

The sturgeon that has just died, according to Mr. De Nyse, had both nostalgia and insomnia in the worst form, and hence, when she developed tuberculosis, her life rapidly ebbed away.

The ravages of disease had so weakened her that at the time of her death her great spine looked as if it were about to burst through the skin, so thin and lean had the once big and healthy fish become.

It was sent up to the Museum of Natural History, where it will be stuffed and mounted. A four-foot sturgeon is now in the pool formerly occupied by the dead fish. The new sturgeon seems to be just as homesick and restless as his predecessor.—New York Times.

Lake Champlain Net Fishing.

SWANTON, Vt., Nov. 27.—*Editor Forest and Stream:* Net fishing is to be stopped in our Vermont waters. We have seen recently a Canadian Order-in-Council which will stop net fishing in all waters adjacent to Vermont, excepting the waters of Lake Champlain (Missisquoi Bay). This leaves the Canadian fishermen to catch the pike-perch that we breed. As their market for those fish is in New York, an act of Congress should be passed prohibiting their sending these fish to our markets. As the Montreal market is flooded with that kind of fish, the Missisquoi Bay fishermen's market is south. Cut this off, and they would stop fishing. This must be done or there will be serious trouble with the Vermont fishermen along the line between this State and Canada.

There is a report that it was the money and influence used by the Vermont net fishermen that caused that clause to be inserted in the Canadian Order-in-Council, granting licenses to fish in Missisquoi Bay waters. If such is the case, they have to thank themselves for this state of things. We ourselves overheard some conversation that they had raised $160 for that purpose, but this seems a small sum to buy the influence of an M. P.

If a passageway was opened through the sand bar bridge it would greatly improve the hook and line fishing in the famed Back Bay of Lake Champlain.

The boys thought that they had scored a point against the Hon. John W. Titcomb when they influenced Daniel Meigs, Esq., M. P., to secure the Canadians licenses to fish, but Mr. Titcomb has caused the blow to rebound against their own heads, and now if they fish with their nets it will have to be under Canadian licenses and in Canadian waters. Verily, how things do act sometimes. A person when at home in his little country town may think himself a fellow of considerable consequence, and find when he gets out among people that he can go out of the little end of the horn and not fill even half of the hole.

STANSTEAD.

A later note from Stanstead says that after the late of his writing "the Vermont Legislature reconsidered the matter and decided to allow seining in the waters of Lake Champlain. We never know what our Legislature has really done until after the session has closed. Make a law to-day and to-morrow reconsider and repeal it again."

The Fisherman.

BY H. MALCOLM.

Row slowly now——A little nearer to the shore——There, that's right——Steady, now——This eddy looks like a good place——The left oar, just a little—There, that's fine——Just by these lilypads a large one was caught the other day——Gee whiz! did you see that?——A strike, and he was a beauty, too——An eight-pounder, I'll bet ——Back water, quick, till I try him again——Steady, now——This is the place——I guess we've missed him ——No, by jove! there he was again——He's got it!——He's got it!——Stop the boat, quick, quick——Turn her out into deep water——He's in the lilypads now, and a goner sure——Thunderation! and he was a monster——Must have weighed at least ten pounds——No, there he is ——He is still hooked——He is all right——He is free from the lilies——He is free——Steady, now, and put the oars in the boat——See the pole; he bends it nearly double ——And doesn't he make the reel sing——Now, he has turned——He is coming toward us——Hand me that landing net——Quick! Quick! He is going under the boat——He will snap the line——Holy smoke! there he goes——Grab the line——Grab the line, I say——Have you got it?——Keep him fast, now——Just a second——Steady, now——There he goes into the net——Here he is in the boat——We have him——He is safe——And isn't he a beauty?——Isn't he a beauty, a dandy, a crackerjack, a peach?——He will go above six pounds, if he weighs an ounce——Wasn't he lively?——Did you see him make that three-foot leap out of the water?——You didn't?——Man, where were your eyes?——Row in, now, and we will weigh him——How much did you say?——Four pounds and two ounces——Pshaw! that can't be right——Your scales are not accurate——Well, he's a beauty, anyway——It took a full half hour to tire him out and land him——Three minutes, you say?——Oh! you're mistaken——That can't possibly be——It was surely longer than that——He was a fighter to the last——Excited, when I caught him?——Naw! not a bit——Cool as a cucumber, just as I am now——He certainly is a beauty.

A Susquehanna Black Bass.

OWEGO, Tioga County, N. Y., Dec. 4.—*Editor Forest and Stream:* Mr. William H. Thomas, of this place, caught in the Susquehanna River to-day a small-mouth black bass weighing seven and three-quarter pounds. This is the largest black bass of the small-mouth variety that has ever been caught in this locality.

I understand that there is a reward offered somewhere for a black bass weighing over six pounds, and write you to ascertain if you can enlighten me on the subject. Mr. Thomas has also requested me to write you on the subject. The statement as to the weight of the fish can be authenticated by affidavits of any number of reliable people who weighed the fish, or saw it weighed. The fish was alive when I saw it.

Canine Elegies and Epitaphs.

XXIX—Geist's Grave.

Four years! and didst thou stay above
The ground, which hides thee now, but four?
And all that life and all that love,
Were crowded, Geist! into no more?

Only four years those winning ways,
Which make me for thy presence yearn,
Call'd us to pet thee or to praise,
Dear little friend! at every turn?

That loving heart, that patient soul,
Had they indeed no longer span,
To run their course, and reach their goal,
And read their homily to man?

That liquid, melancholy eye,
From whose pathetic, soul-fed springs
Seem'd surging the Virgilian cry,*
The sense of tears in mortal things—

That steadfast, mournful strain, consoled
By spirits gloriously gay,
And temper of heroic mould—
What, was four years their whole short day?

Yes, only four!—and not the course
Of all the centuries yet to come,
And not the infinite resource
Of Nature with her countless sum

Of figures, with her fullness vast
Of new creation evermore,
Can ever quite repeat the past
Or just thy little self restore.

Stern law of every mortal lot!
Which man, proud man, finds hard to bear,
And builds himself I know not what
Of second life I know not where.

But thou, when struck thine hour to go,
On us, who stood despondent by,
A meek last glance of love didst throw,
And humbly lay thee down to die.

Yet would we keep thee in our heart—
Would fix our favorite on the scene,
Nor let thee utterly depart
And be as if thou ne'er hadst been.

And so there rise these lines of verse
On lips that rarely form them now;
While to each other we rehearse:
Such ways, such arts, such looks hadst thou!

We stroke thy broad, brown paws again,
We bid thee to thy vacant chair,
We greet thee by the window-pane,
We hear thy scuffle on the stair;

We see the flaps of thy large ears
Quick raised to ask which way we go;
Crossing the frozen lake, appears
Thy small black figure on the snow!

Nor to us art thou dear
Who mourn thee in thine English home;
Thou hast thine absent master's tear,
Dropt by the far Australian foam.

Thy memory lasts both here and there,
And thou shalt live as long as we.
And after that—thou dost not care!
In us was all the world to thee.

Yet fondly zealous for thy fame,
Even to a date beyond our own
We strive to carry down thy name,
By mounded turf, and graven stone.

We lay thee, close within our reach,
Here where the grass is smooth and warm,
Between the holly and the beech,
Where oft we watch'd thy couchant form,

Asleep, yet lending half an ear
To travelers on the Portsmouth road—
There choose we thee, O guardian dear,
Mark'd with a stone thy last abode!

Then some, who through this garden pass,
When we, too, like thyself, are clay,
Shall see thy grave upon the grass,
And stop before the stone, and say:

"People who lived here long ago
Did by this stone, it seems, intend
To name for future times to know
The dachshound, Geist, their little friend."

—Matthew Arnold.

*Sunt lacrimæ rerum.

The Dog's Mentality.

Are animals intellectual? Have they minds and powers of reason? Man is an intelligent being. He may have his intellectual and reasoning powers strongly developed, and still when out in the woods become "lost" and thoroughly demoralized, his eyes will be staring and glazed, without any expression of intelligence, and his hearing so impaired that at first he will not recognize the voice of his best friend.

Recently we have several times seen the same thing occur here in the city with an intelligent young setter, who would stop to pay his respects to some other dog, or to investigate some attractive scent; when he would look up and miss his master, how quickly his whole appearance would change. He would dash here and there among the crowd thoroughly rattled, eyes wild and glazed, and would have to be called several times before he would recognize his master's voice; then in an instant his whole appearance would change, his eyes become bright and beaming with affection and love as he jumped around his master, his actions seemed to say "I was lost and am now so happy that I have found you again."

If beings only moved and acted through instinct, without reasoning powers, could they become so mentally rattled and lost, and would they have the power to feel the impulses of affection, love, anger, hatred and jealousy. How many many times we see these feelings plainly expressed by our canine friends. Let madame notice and caress one of the setters in the presence of the household pet "Bob" the fox terrier, from a bright, cheerful little fellow he is suddenly transformed into a blazing fury, and there is a dog fight on the next moment. When it is all over, to see the humble, beseeching and apologetic look that the little hero of a hundred fights puts on, which plainly says "I am sorry that I was so naughty, but I couldn't have you pet that big fellow," would make any skeptic admit that Bob was moved and influenced by human-like passions, consequently he must have reasoning faculties.

A well bred dog never expresses any emotional qualities such as affection or hatred, but from some reason, and if he has for so doing a reason, why then he must possess reason. It is impossible for a human idiot to become rattled or mentally demoralized, neither can they have the sensitive feelings of affection, hatred, fear or hope. When hungry or thirsty, instinct causes them to eat and drink to satisfy nature's cravings, but they show outwardly no glimmering or spark of reason in so doing, and if they possess such faculties they are too dim and faint to be perceptible to our ordinary eyes. Ergo—dogs must have reasoning powers and mind and reason, consequently in a greater or less degree so have all animals that are endowed with the breath of life.

Stanstead.

His Unwritten Elegy.

Editor Forest and Stream:

I have been very much interested in your series of canine epitaphs and elegies. I am praying the Fates to give me occasion to contribute to the list. What I would dearly love to send you would be the epitaph or elegy on a vigorous husky-voiced dog which works his combination megaphone and explosive bomb bark o' nights in a backyard on Fifty-seventh street, Borough of Manhattan. So appreciative am I of the canine epitaph done in rhyme that I would pay for one of this loud mouthed terror a full column long at advertising rates.

Insomnus.

P. S.—You may get it some day.

Yachting.

Sir Thomas Lipton's Cup challenger, Shamrock III., building at the Denny's yard, Dumbarton, had a narrow escape from destruction by fire on Thursday night, Dec. 4. The fitters' shop, which was close by the shed where the yacht is building, was gutted, and it was only by great effort that the building that enclosed the third Shamrock was saved, as a strong wind was blowing in that direction. The yacht was not damaged.

All the frames are now in place, and barring delays she will be completed by the first of April. This means she will be rigged and ready for a trial trip by the middle of that month. It is learned on very good authority that Shamrock III. will be steered by a wheel instead of a tiller. Captain Wringe, who is to have charge of Shamrock III., is, we understand, in favor of a wheel, and it is at his suggestion that this innovation will be introduced.

At the Herreshoff shops, at Bristol, work is being pushed on the new boat that is being built for the Cup defense. The boat's construction is surrounded with the same secrecy that has prevailed in previous years, but it is learned that the casting for the lead keel came out perfect, and is without any flaws. The frames and plating are to be of Tobin bronze, and the lead keel is now being sheathed with that material. It is believed that the boat will be ready for launching about April 1, or about the same time that Shamrock III. is to be put overboard. If this proves to be the case she will have the advantage of several weeks' more sailing than Shamrock III. will, for the changing to jury rig, the voyage across and the rerigging on her arrival on this side, means a big loss of time, but even so the English boat will have more tuning up than the previous defenders have had.

Mr. Norman Macrae has ordered a boat from Mr. A. E. Payne, of the firm of Messrs. Summers & Payne, Southampton, England, for the defense of the Canada Cup. She will be built by Captain Andrews, of Oakville, Canada. The new boat is said to be 40ft. waterline, 60ft. over all and 9ft. draft. Her sail area will be about 2,600 sq. ft.

There is some talk about Effort, the successful 43-footer, being entered in the trial races to be held by the Rochester Y. C., for the selection of the challenger for the Canada Cup. Effort was designed and built by the Herreshoff Mfg Co., and is a very slippery craft. It is doubtful if she is up to the scantling requirements that govern the construction of boats competing in the Canada Cup contests.

Word is received that two boats are being built for the trial races by Detroit yachtsmen.

Men of the Coast.

Two Passages.

BY F. L. ENO.

About a dozen years ago I took passage in the schooner Lucinda G. Potter, Capt. Potter, bound from Boston to Newport-News, light. The month was October, and the day of our departure all that could be desired. The sun was bright, the sky a deep blue, the waters of the harbor blue as the sky, and the crisp, fresh air sent the blood tingling through one's veins.

A year or more of confinement in the city makes one appreciate a morning like that. The desire to get hold of something heavy, after long service in office or at desk, comes as a natural reaction, and on our shores one turns instinctively to the sea. There as nowhere else, one can be out of doors; there is a field which calls for qualities of the sternest kind; and the men who handle our coastwise sailing fleet are made of stern material, for no others can stand the life. But for a few days the change from the daily routine and grind to the wind-swept deck and ocean furnishes just that tonic which the physical and

"A BIG SCHOONER—THE MOON LIGHTING UP THE DECK."

mental man needs; and I appreciated to the limit the beauty of the immediate scene and the exhilarating sense of expectation which any voyage, long or short, always arouses in the amateur.

Our ship was a vessel of about 600 tons, a centerboard three-masted schooner; a large vessel and heavy to handle, as she was a "hand vessel," so-called, that is, she was not fitted with a donkey engine forward for hoisting sails and anchors, etc., but everything had to be done by hand.

High out of water she rode as we drew near in the tug, and climbing over the side we found the mate standing on deck in evident disgust.

"Have those sailors come off yet?" was the first thing Capt. Joe fired at him.

"Yes, sir. Come and gone. They said she was too big and heavy and with no steam, so they went back in the tug. Me and the second mate has cleared things up best we could, and the shipping master said he would send another crew right along."

Here was one vexatious item, one among many of the coasting skipper's life. The charter party is signed, mate

"THE WORLD OF WOOD AND CANVAS."

and cook engaged, grub stowed away, perhaps a fair wind blowing, when a few hours at one end may mean a week at the other, and the sailors, shipped for the voyage by the shipping-master uptown, can come aboard, and if they don't like the looks of things, or want one more drink or take any fancy, can go ashore, if they can get there, and the captain is helpless. His only alternative is to obtain another crew. In this case the sailors didn't even come aboard; the high-sided hull and heavy spars of the schooner evidently scared them, for they came out, gave one look at the schooner and said: "She's a brute. To hell with the ——— hooker," and returned in the boat.

The "old man" relieved himself of a few sweeping observations in regard to sailors and shipping-masters, and we went below to store our dunnage.

The cabin of a 600-ton schooner is none too roomy, as vessels go now; but I was allotted a stateroom by myself, and comfortable enough. The captain's room and the spare room, if there is one, are on the starboard side; amidships the main cabin, which also serves as a dining-room in a small craft, and did here; on the port, the mate's and steward's rooms, and forward of all a small pantry and forward companion-way. Any degree of comfort or the reverse can be found in these long-shore cabins; but

as a rule, comfortable and sometimes even elegant apartments are provided for the after guard; and in case there is a woman on board, wife of captain or mate, the interior is at once transformed into something like a shore home and rendered doubly inviting by the contrast between its air of homelike quiet and the rough and rude aspect of things on deck. As the vessel grows in size, the cabins keep pace with the rest, and those in some of our recent big schooners are dreams of comfort, luxury and taste, with steam heat, telephone forward, bath rooms finished in white and gold oftentimes finished throughout in natural woods; and, in fact, wholly in keeping with the American spirit that is not content till it leads the world. One of our four-masted schooners a couple of years ago, created a sensation in France. They had never imagined anything so magnificent; but thousands passed that vessel every day in Boston and never gave a second look.

But it was no morning to stay below; the captain was impatient of delay, and the passenger had been so long a time short of sea and breeze that we preferred the deck. In the course of an hour Captain Joe, who had kept his binoculars trained up the harbor, gave a grunt of satisfaction.

"Here come our shell-backs. Bet they won't go back this time. If I once get 'em aboard we will go to sea, if they are all dead drunk."

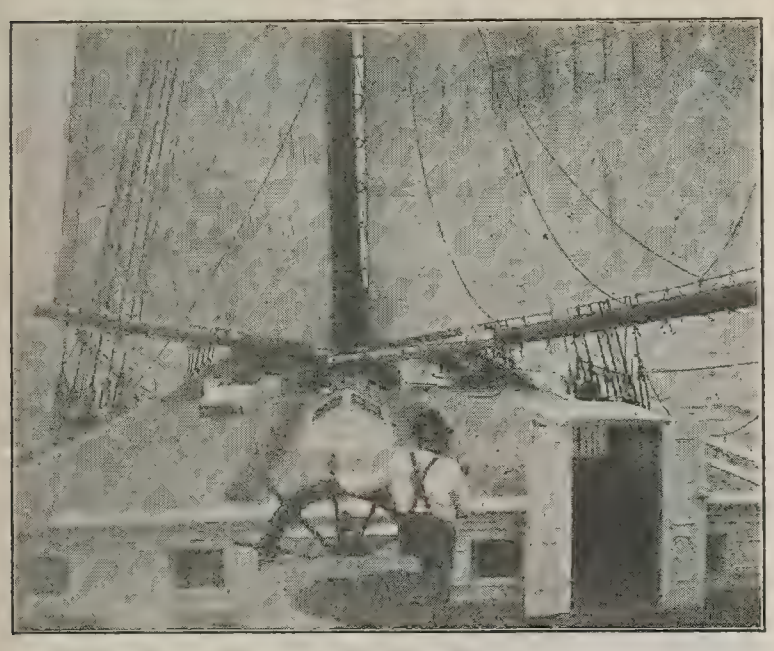
The boat came alongside, the four sailors who were grouped on the forward deck passed up their bags and dove into the forecastle, soon to reappear, rigged for duty.

"Now, then, boys, Spanker," sang out the mate, as the first man "showed a leg" out of the forecastle door.

"Spanker, sir." "Spanker" was echoed as they jumped to obey, and three of us on each halyard sent the gaff aloft till the weight of the canvas began to tell. She comes harder now, and four get on to the throat, then the peak; the fore-handed man sings out the word, with all kinds of twists and accents, and a few inches at a time the heavy sail creeps up.

"That's well, sir, the peak. Jig."

"Jig, sir," and the gang tail on to the jig (a smaller tackle on the other end of the halyards, which increases the purchase many fold). But all must pull together or the effort is wasted, and the only way to do so is for one of the men, usually the best sailor in the bunch, or, if the



"SPLIT OPEN."

mate is hauling with them, the duty falls upon him, ex-officio, to give the signal; and this is done by the most unintelligible string of expressions, which mean nothing more than that it is time to transfer your weight from the deck to the halyard or rope on which you have barely room to place your hand; for with four hauling on one halyard, each one must know what to do with his knees and elbows, and not knock somebody in the eye or sit down in his lap. So it goes like this: "A-ha-a-a!" "Up with him!" "Ho-boy!" "Peak him!" "She must!" "Wey-hey—!" "Yo-oh-oh-oh. Ho!" "Come down!" till your arms ache. "Catch a turn!" cries the mate. "Swing off!" and the bunch settles back till they touch the deck, and the mate hauls in the slack. The boom rises from the saddle and the heavy sail is set, flattened by the weight of the spar.

So, I imagine, Dana sailed out of Boston seventy years ago.

Main and foresail follow, and then we man the windlass, and walk her up to the anchors till the brakes begin to go hard. The mate looks over the bows. "Heave away!" "Heave!" "Start up the outer jibs a couple of yer!" and he lends a hand at the windlass. The mate of a coasting schooner has plenty to do. Suddenly the chain comes in freely, the anchor is broken out and the brakes go rapidly up and down.

"Vast heaving!" Jib halyards. "Jib halyards, sir!" "Two of yer jump up and loose them tops'ls!" The old man has the wheel. We hoist away on the jibs and soon the cry comes down from aloft: "All ready the main!" "All ready the fore!"

"Let 'em hang and lay down. One hand take the wheel."

The mate comes aft and gives a look around. "This wind is terrible light; we shall have a head tide, too."

The schooner is slipping quietly through the water, but as we get into Broad Sound, the wind, which had been losing strength, fell altogether, the flood tide began to make its power felt, and to prevent drifting back up the channel we anchor and haul down the jibs.

The steward comes aft with his basket, and the odor of ham and eggs floats up through the companion-way.

What an appetite all this has given us! The crisp air and exercise have started every muscle and nerve into action, and you are alive. It takes a couple of hours of this sort of thing to make one appreciate ham and eggs. You crave something strong; strong ham, strong coffee, strong dishes, strong language; the atmosphere of the sea breeds strength, and things which on shore among shorefolks would create a terrible commotion, at sea pass unnoticed; the grub served up in the forecastle amid filthy surroundings is eaten with a relish; while, if the same were set before men of the same stamp, engaged in some indoor, enervating occupation on land, there would be a revolt. Niceties of speech and action have no place on shipboard; the rough, sturdy qualities are the ones that tell, and the men who can drive these schooners up and down the worst coast in the world, winter and summer, may and do have the aspect of refinement; but just beneath is the rugged self-confidence and resourceful spirit that does not show up to the public on the diamond or gridiron with thousands of yelling "rooters" to goad them on, but fights its battles alone off shore somewhere without an audience, in the cold and wet and danger of the North Atlantic.

I love to rub elbows with these men; to share for a period a little of the exposure and risk they experience through the years, and after meeting, day in and day

"PEAK HIM."

out, the artificial life of the city; the soft muscled, soft spoken clerks and business men of the street, what a change to heave at a winch and haul at a rope with a half-dozen stalwart two-fisted fellows who could clean out a store full of men-milliners. I never meet a man with clean, soft, white hands, bediamond, maybe, without a wish that I could be the mate for one watch, turn him out at eight bells some cold, rainy night and send him aloft to furl a topsail.

A few weeks ago a coasting captain and I went into an ice-cream parlor in Savannah to kill an hour one evening, and were seated at a table; two or three girls came in, walked up to the soda fountain and engaged in a vapory conversation with the delicate thing who stirred the syrups. As they exchanged sweet nothings over the counter, the young man's mezzo-soprano voice was heard:

"Yes, a nickel, please. Thanks. Ta! Ta!"

I glanced at the "old man," who, by the way, had practically lost all his sleep on the passage down on account of neuralgic pains in the face, the beginning of the end of twenty years of knocking round the coast; and had often expressed his lost opinion of a seafaring life.

"Which had you rather do, serve out syrup and taffy to the girls in this gilded alhambra, or go to sea?"

"Go to sea, by ———" and the withering look of disgust he gave the innocent peddler of prattle said so, too.

But ours was to be no winter passage this time. The Indian summer haze hung over the sea and the sun reflected from the smooth water was warm at noon. Off in the southern board a dark streak appeared, and soon a light southeasterly reached in and we got underway.

SPANKER BOOM (THAT SOMETIMES TAKES CHARGE).

Jibs and anchor came up again, and Captain Joe hove the wheel down.

"If I can get this old wagon round on the other tack we will start across the bay; but she does hate to come; let's flatten in this spanker sheet, son. Now, when she rolls, hook that boom 'tayckle' on to the rail. Come aft a couple of yer and man spanker-boom tayckle."

"Spanker-boom-tayckle, sir; spanker-boom-tayckle, sir," and we work her around and get her headed for Cape Cod.

"Get the tops'ls on her (to the mate)," and we masthead the mizzen from the poop, haul out the sheet on the winch and take the tack around the mast. The fore and main go up to the same music as the lower canvas. "A-a-ho!" "Rouse him!" "Once again!" "Mast-head him!" and then as the hard, sudden jar coming the length of the halyards from the topmast head, tells us that one block is hard up against the other. "Two blocks! Belay!" "Sheet!" "Sheet, sir!" "Tack!" "Tack, sir!" and the sail is set.

The wind comes fairly fresh, and we go out of the sound dragging the centerboard along the bottom until the old boat trembles; but she is soon clear of the shoal, and we spend the rest of the afternoon beating slowly out of the bay.

The mate has all hands forward getting the anchor, which has been hanging from the bows on the rail, whence a turn of the hand can send it to the bottom again; fenders are piled just forward of the break of the quarter deck; decks are cleared up, hatches taken off to air the hold, and if the weather permits all hands have a busy day in the hold, sweeping up and dumping overboard coal dust; and if the vessel be bound South for lumber, or down East for ice, a thorough mate will make the hold as clean as a table, after a day of wet, dirty drudgery.

The night was calm, clear, and the sea smooth. The sea is fascinating by day; night adds the charm of mystery. Except upon the blackest, darkest night, you can always see something; a cheerful ray from the cabin skylight shines into the spanker and illumines sail and boom with ever-changing areas of light. The dim glow in the binnacle seems almost like a companion, and the bright compass card the true friend that it is. The soft hiss of foam under the boat on the stern davits, as the water races past, or the squeak of a block aloft, or the groaning of some unknown timber, sounds different at night. The cool, damp air fans out of the sails, the deck is wet with dew, the spars, magnified by the darkness, appear to stretch up out of sight; the great expanse of canvas looks almost ghostly. If it is calm, the racket is tremendous. This may seem paradoxical, but a large schooner or any fore-and-aft-rigged vessel of size, becalmed in a sea or with a light following wind, can create a most awful disturbance, and especially at night. With no wind to steady

SCHOONER LUCINDA G. POTTER DISCHARGING COAL. TAKEN JUST BEFORE HER LAST TRIP.

her, your watch on deck is a series of groanings, creakings and ripping, tearing thunder, varied about every two minutes by, perhaps, ten seconds of absolute quiet, when you can hear the clock ticking in the fo'ard cabin; then a block squeaks up aloft as she rolls to windward, booms grind on the saddles, the heavy gaffs dig their jaws into the mast, boom-tackles snap up short, and as she rolls to leeward the sheets take the strain, sheet-blocks are whipped up from the deck to fall again with a crash, the immense spanker boom, well off over the quarter, rises high in the air; the weather lift slats into the sail with a swish that sounds like the explosion of a rocket, as the spar falls again, and you think the sleepers below will surely come up to see what the trouble is.

But with a breeze which allows everything to draw, the sight of a big schooner stealing along at night, the moon lighting up the decks and showing every sail full and hard, as clear as day, is one to remember. There is quiet then; the man at the wheel leans against it, motionless; she would steer herself with the wheel in the becket. There is just enough wind to keep her moving without any fuss; and gazing up at the quiet stretches of canvas and towering spars, you forget earth and dirt and trouble; the world is made of wood and canvas, and is inhabited only by fleeting shadows coming and going in the uncertain light, and you are apart from it somewhere in space—then the mate begins a long yarn about his girl in Providence and breaks the spell.

The day following found us off the Cape with the wind about south and weather threatening; the small fleet that had come out of Boston Bay with us, was hull down astern, and Captain Joe picked up the end of the spanker sheet and shook it over the rail: "Come on. I never saw anything yet this old packet wouldn't outsail. She's a plank on edge, but she will travel."

And we were traveling. She was heeled over like a yacht, and one could hardly stand on deck. Toward dark we laid out and furled the outer jibs, clewed down the staysails and fore and main topsails. Next to flying comes riding the jib boom of a vessel in a seaway; you are lifted with one grand sweep, poised a moment in mid air and then things drop from under you. You reach forth your hand to grasp a stay and your hand flies up. You try to step on a foot rope and find that you weigh nothing. You cannot get down to it; you lie over the boom and feel no pressure; and then you weigh four or five hundred pounds, and can hardly raise hand or foot as she lifts again. The roar of water under the bows is like a small cataract, and the humming of the wind through the rigging, the strong, bracing air of ocean, the general atmosphere of rude, rough life are a tonic to the one who doesn't have to.

Once through the slue of Pollock Rip, the old man decided to anchor, as it began to get thick, so we let go; at noon the following day we got underway and with a rattling westerly tore along in the smooth water.

At dark a small sloop yacht about 40ft. long passed us to windward; she was well heeled down, under a reefed mainsail and jib, and showed her crew in oil-skins. We waved a greeting, and the mate gave her a long look.

"That's the life for me. Plenty of money and cruise where you want to. No coal dust about her, I'll bet. Look at those," and he struck out a pair of grimy paws, hardened and bruised. "That's what going to sea is. Beauties, ain't they? I suppose you shore people have lots of money."

Sailors always seem to think that a stiff hat and high collar and fairly clean hands are some sort of a financial rating; and I have heard an ill-concealed snort of contempt and pity from one of the hands, when, in reply to the captain's query as to where I would rather be that evening, I had answered, "Right here." Why any right-minded person should voluntarily isolate himself from all the pleasures of land, especially in the winter, and join his fortunes with those of a coal schooner, passes the comprehension of the average jack.

"Couldn't you get me a chance to go in some yacht, mister? (That is a regular query.) I'd like something where I could keep clean; this coal droghing is dirty work."

"Didn't that feller astern of us anchor? I don't see his lights," said the captain. "Suppose we ought to if he did. It's funny how one vessel will do what another does. If one takes in a topsail everybody else begins to look around and guess on the weather and thinks perhaps the first one has seen something that he hasn't, and then he will take in his," said the mate. "I have a friend, mate of a schooner, and he come out the Chesapeake in company with another vessel and kept along all day together, with the wind sou'west. About dark the other one jibed over, hauled to and started to beat back. Well, this feller said the old man he was with looked round and sniffed and guessed and reckoned and finally hauled to, and followed the other one back to Hampton Roads, and then sent over to find out what the reason was."

"Captain was taken sick," was the answer. "Why did you come back?"

Meanwhile the wind had been freshening, and at dark the schooner was tearing along well over on her beam-ends. Supper we ate squatting on the cabin floor, close up against the lee bulk-head, holding cup in one hand and plate in the other; while the steward crawled about with his basket on his arm, occasionally expressing his opinion of wind and schooners, and of that cranky schooner in particular. It was blowing fresh when we returned to the deck; the man at the wheel had about all he could do to keep her straight. The wind was about abeam and we were going at steamer speed. I went forward along the weather side at the captain's warning, where the lookout was swinging from one side to the other.

"She is turning the turf to-night, all right."

"Yes, sir. But I don't like the way she lays over. She is too tender, altogether," and the old sailor glanced aloft at the staysails and topsails, straining against the stars. "Old man ought to get those rags off her before they blow away."

A moment later a wicked puff struck the schooner, and the main topsail split across and began to slat to pieces. Then "clew" up fore and main topsails. Haul down flying jib. Haul down main and mizzen topmast staysails. Tie a couple of reefs in the spanker. Let her come to (to the man at the wheel). "Come to, sir." Spanker sheet, all hands, "Spanker sheet, sir!" Well spanker sheet. "Hook on your rolling tayckles and run that reefing-plank aft; stand by the halyards. Lower away. Two reefs! Keep her away a couple of points." "All right, sir! Knot away," sings out the mate from the reef-earing then hoist away again, and the spanker is reefed.

"I like to get that spanker reefed, then you can handle a vessel," said Captain Joe. "I've known of a fine vessel that was thrown away by holding on to a whole spanker a few hours too long. Then the spanker boom took charge when they did try to reef it, carried away the wheel, she broached to, got her decks swept and they had to leave her—just thrown away."

Shortly after midnight a heavy squall struck the vessel; she laid down like a yacht and then came to in spite of the helm.

"Guess we might as well let go and tie things up"; so we do and put a peak-stop on the sails, furl the jibs and set an anchor watch.

Morning showed a beautiful breeze and clear sky, and soon after daylight we got under way. As the windlass breaks go up and down, the men look around. There is nothing in sight but a lightship a few miles to the east'ard.

"Cross-rip," said one. Again we make sail. The men sweat as they pull; the air is rank with the odor of moist tobacco, and the stinking smell of the forecastle, which still clings to their clothes. No wonder sailors are short-lived. Here, in pleasant weather, in a mild month, and smooth sea, a man is expected to do a good half-day's work before breakfast; add to that the broken rest, wet and cold, and the terrors of the land. While at sea the limit for sleep at one time is three and one-half hours, never more, often less (a mate with whom I once took a trip in the great blizzard of '88 was on deck for a period of 92 hours without sleep), and if there is a hell on earth it is being dragged from a warm, comparatively comfortable bunk to the wet, cold, dark deck to battle with straining gear and banging canvas. Steam has lightened the labor somewhat in sailing vessels, but the cold and wet, and danger, and sleepless nights still take the life out of the sailor man.

The remainder of our passage was uneventful. We had moderate fair winds, and about a week after leaving Boston dropped anchor off Newport News. Here I left the vessel with the feeling of regret which I think always comes upon one at parting with the fabric which has borne him in safety to his destination.

Two months later the Lucinda G. Potter sailed on the same trip from Boston to Newport News to load coal back. Another captain went in her this time, and the passenger stayed ashore. Of the ship's company of the trip as told above, only Bunce, the steward stayed by. Captain Joe was in Bath superintending the building of a four-master.

A few days before Christmas, which fell on a Thursday, they sailed. Terrible weather prevailed, and in a N.W. gale they ran down to Monomoy and anchored somewhere under the lee of the land. Between Cape Cod and Hatteras is a stretch of water which could tell some fearful tales. See the chart of Cape Cod showing the wrecks of thirty years. It looks like a cluster of flies on a fish-hook. I have heard captains who have been going to sea all their lives say that right off Cape Cod was where they caught it the worst; and as we were pacing the deck off Highland Light one day, one brown, weather-beaten old captain, a fellow passenger of mine in the Baltimore steamer, with a look in his half-closed eyes as if he were peering to wind'ard in a N. W. gale, gave a grunt of contempt, directed at the captain in his warm steam-heated pilot house and said: "Look at that; a warm parlor and always laying your course, plenty of company and good grub and good pay; that's a little different from the life I've led. I've seen weather off here that would make a man white-headed in a night. Awful! Awful!" And the wrinkled eyes and gray hairs seemed to confirm his words.

Through the Sound with its cross currents and fogs and shoals, most of the coastwise traffic takes its way, and in winter it is man-killing work to handle a big schooner on this coast. Sailors proverbially want sea room, and let it blow, but on the coast, when every wind may make a lee shore, there is no rest for the coaster.

The Potter on Thursday, the 23d, with a moderate S.W. wind, worked through the Sound and anchored in the Vineyard. Wednesday, with the wind N., gave them a chance to get out, and on Christmas morning, when the wind went to N.E., they were well along with every prospect of making a quick run.

The wind and sea rose rapidly, and Capt. Evans reefed her down and let her come to, to keep in under the beach. The temperature was falling rapidly, and before night the cold was intense, and the wind, coming in heavy squalls, laid the schooner, crank as she was, well over on her side. As darkness came on, she was running quartering, with spanker furled, under double-reefed fore and mainsails, main jib and flying jib. The man at the wheel, despite the freezing air, was warm with his exertions to keep her straight.

The captain and mate were together on deck and stood watching the vessel jumping through the seas.

"How she is traveling! Seems as if she was terrible tender—more so than usual."

"Well, it's blowing very fresh," said the mate, "and with this sea she rolls down."

"But she seems to act different. Sort of logy and slow in rolling to windward. Don't you think so?"

"I don't know. Do you suppose there is any water in her? The pumps sucked yesterday morning in the Vineyard."

"Well, perhaps it's my imagination," and the captain went below to supper, hurried through the meal and returned to the deck.

The man at the wheel spoke up:

"She steer bad, sir. I no unstan'."

The mate stepped to the wheel. "Let me take her." After a minute, "She does steer quer. I'll try the well." He came back with a white face. "There's a lot of water in the hold, sir." The captain jumped. "Call all hands. I wonder how long this has been coming in. It can't be very long, as we didn't notice anything till just now. Ship the brakes and start 'em pumping."

The sailors went at the pumps, but at midnight had failed to reduce the water in the hold. It gained slowly, but still gained, and though wearied with the night's labor, morning showed them putting up a stiff fight against a merciless foe. Things were looking serious. They had been divided into watches of four and four, one watch resting and sleeping while the other pumped; but at such exhausting labor, a half-hour at first and then fifteen minutes sufficed to use them up, so that sleep was almost denied them. They cut down through the cabin floor and passed the water up in buckets—as well try to scoop it out with their hands.

But morning brought a shift of wind, which caused their hearts to sink; out of the N.W., butt-end first, came the blizzard, and the schooner, helpless and unmanageable, drove to sea. They had long ago lowered the sails and given all their attention to the pumps, and Friday and Saturday, the two days following Christmas, 1890, were for the eight men in that waterlogged craft days of desperate unequal struggle with grim death. In New York city, forty miles away, bells were ringing and Christmas festivities were in full swing. Out in the bay, within a few hours' steaming of a swift tug, men of the coast were fighting for their lives—and lost. Finally the poor fellows gave it up. "We can't pump no more, capen," said Chris, the mate. "We are all used up."

Wallenberger, a Swede of immense size and strength, lifted his hands, swollen and bleeding and half-frozen. He had done the work of two men, and his vast powers had been drawn upon to the verge of collapse.

"We tired, cap'n. No use de pump."

The men spoke and declared they could not lift another pound, and knocked off at the pumps and stood around waiting for the seas to come aboard. Nobody knew where they were, and nobody cared. No pen can write the true story of that three-days' drift. The little told here was gathered from the disjointed, half-crazed remembrance of a Swedish sailor, whose language at best was difficult to comprehend.

Sunday morning the leak had gained so fast that the schooner filled and capsized. There was left in some one strength enough to crawl along and cut the lanyards of the weather rigging, and she finally rolled her masts out and the hull righted. As the masts went, the spanker boom swept the after house clear of the skylight and caboose, smashed the wheel, monkey rail, boat and davits, took two of the men with it in its course, and lay under the counter grinding against the side. Somewhere in the tangle of spars and rigging to leeward, two others had met their fate and one was found in the hold after the vessel had been towed in and pumped out. The three who remained clung to the wreck of the skylight and waited for the end. One of the three of less endurance than the others, died during the day. But Wallenberger and the captain could not lift the frozen body and left it where it lay. Another night shut down and hope fled. There was about one chance in a thousand of that low-lying hulk being seen or of their cries being heard, and to pass another night on the cabin top meant death.

I well remember that bitter day. On shore the wind made the cold doubly felt; but to the men on that waterlogged wreck, exhausted with three days' and nights of horror, worn with lack of food, sleep and shelter, and freezing in the winter's blast—and all this right at our doors!

But the captain and Wallenberger kept a sharp lookout, and when about 9 o'clock a vessel's lights were seen, they raised a feeble cry and were heard. They were then about fifty miles east of Five Fathom Bank Lightship, and Providence sent the schooner D. A. Lawson, Capt. Smith, from Savannah to Philadelphia, just in time. Capt. Smith lowered, the boat's crew had a tough pull of an hour in a rough sea, and found what was left of the Lucinda G. Potter. Tenderly the living two were taken aboard, but the warmth of the cabins proved too much for the poor frozen limbs, and the captain died soon after the rescue. Wallenberger's iron constitution pulled him through. Later tugs took the wreck into Philadelphia. She was sold, rebuilt and under another name sails the sea to-day.

But the men of the coast come and go. The age of adventure and daring has not gone by. You might think so to walk along the street and see men in offices doing woman's work; but danger and heroism are there, just off the coast, within sight of the glare of the lights of New York and Boston. Take a second look at that coaster following the tug down the harbor some frosty morning, with the men jumping around decks, making sail. She may never come back. You don't hear much of adventure and strange experiences in distant seas, for the plodding tramps have eliminated the romance you used to associate with snowy decks and a maze of sails and rigging. But while Cape Cod and Hatteras are on the chart you can find the same thing right here at home. And I, for one, uncover to the men who handle our coastwise sailing fleet, to the men who broil and freeze and know long sleepless nights of toil and vigil, and terrible lee shores and fog and snow and collision—to the men of the coast.

The South Bay Scooter.

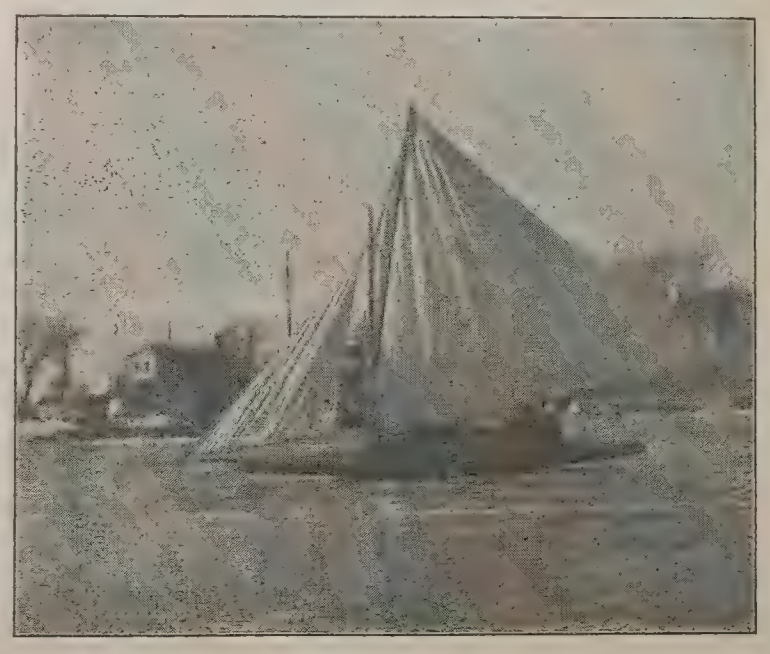
Editor Forest and Stream:

In the following description of the "South Bay scooter," I trust I will convey to many of my fellow sportsmen the information that they have sought ever since the scooter has been brought into general notice by now and then a note of its many advantages as a valuable acquisition to every true sportsman's outfit, by every sporting paper that could secure an inkling of its uses.

AWAITING INSTRUCTIONS.

As no thoroughly detailed account of its general lines, dimensions, uses, etc., has yet appeared to my knowledge, I now take pleasure in giving such to the readers of your valued publication.

The South Bay scooter is a boat designed especially for winter use. Its length is usually about 14ft., and beam amidships about 4ft.; depth of hold, 12in. The boat is of the "whaleback" type, being, if anything flattest on the under side. The bottom is fitted with two runners, brass shod, about 9ft. long, placed parallel about 20in. apart, total depth of wood and shoe about 2in. An open hatchway or cockpit is cut in the deck about 6ft. long by 2ft. wide, narrower at either end. The boat's full equipment consists of a mainsail and jib, a pair of 6ft. oars, one long pike pole and one short one, also a rowing seat. The deck outlines are not unlike any water boat, except that the stern narrows up to either a very sharp round or sometimes to a point like the bow.



"READY."

By the above description you can see at once that the boat combines a craft suitable both for ice and water sail-

ing. And it is right here that you will recognize its valuable qualities.

How often have our sportsmen reached the ducking grounds to find the surface of the water coated with ice, too treacherous for an ice boat, unsafe to cross afoot and too thick to row or sail through, and with this condition of affairs seen myriads of birds safely huddled in an open "air hole" half a mile or so from shore, safe from all intrusion, yet forced to return to the city, dollars out of pocket, no ducks, no sport, nothing except disappointment, because there was no means of reaching the feeding grounds.

"LINED UP."

Here is where the scooter comes in under the above conditions. Instead of returning home, now the hunter launches his scooter, puts in his decoys, gun, etc., puts on a white canvas suit and hat, hoists his sail and makes out for the air hole, sailing over the ice where it is sufficiently strong and through it where it is weak, but one thing he is certain to do, and that is to reach the air hole in which he puts out his decoys, covers his scooter with thin ice broken from the edges of the main body, lays down in the hatchway of his boat and then have duck shooting such as never was dreamed of until scooters were devised.

A DISCUSSION ON RUNNERS.

The accompanying illustrations will give your readers a good idea of how a scooter looks rigged up especially for sailing, as many sportsmen down this way have boats specially for that purpose, only finished up in the finest style, bright decks, brass fittings and all the trimmings of a yacht. The regular gunning scooter is painted white all over, but has all the other qualities of the finest boats as to sailing, rowing, etc.—in fact, all except looks.

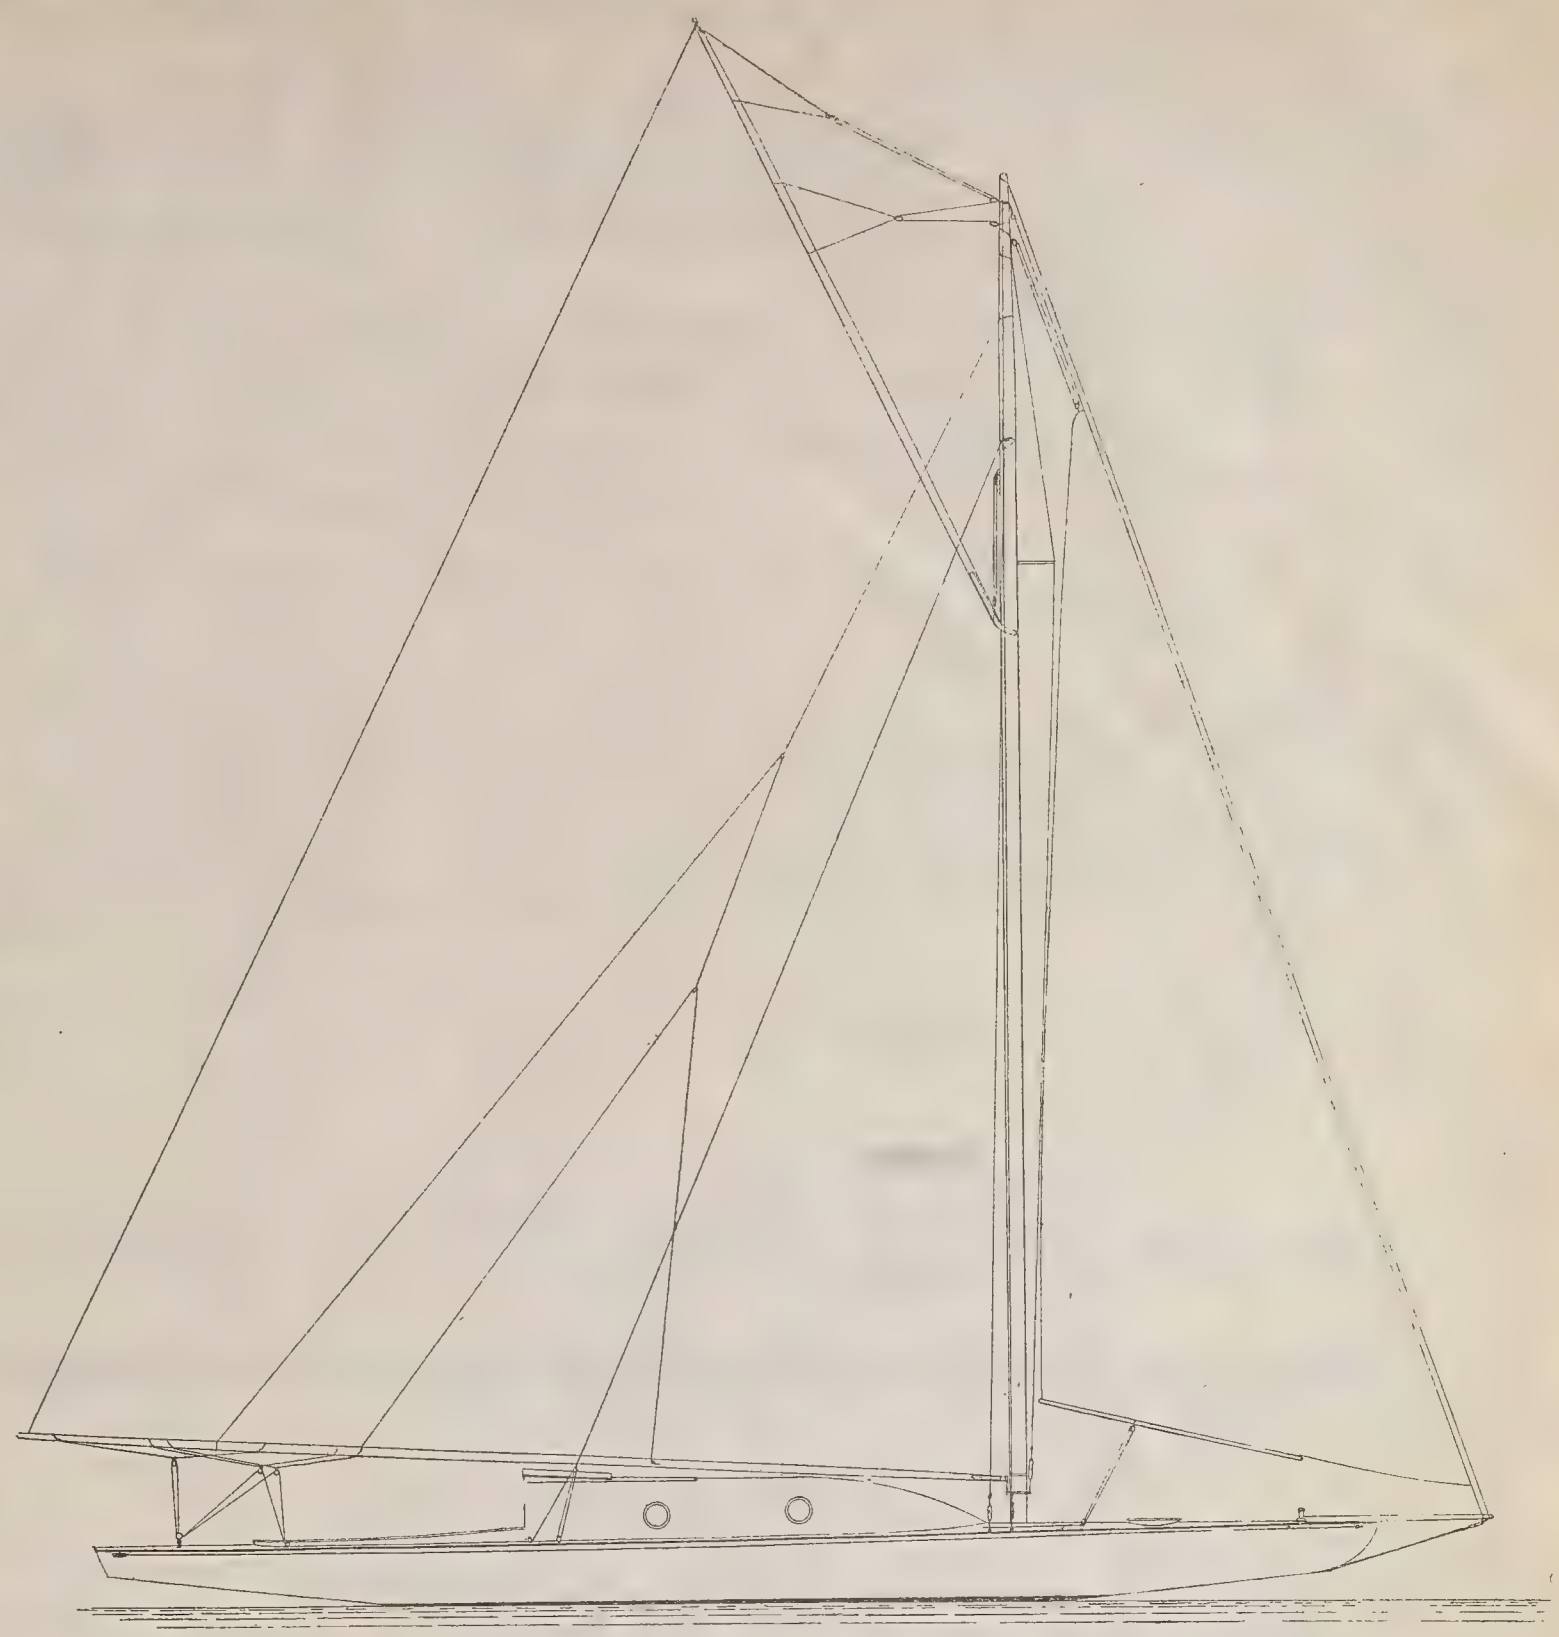
H. V. WATKINS.

English Letter.

Navahoe, Herr Watjen, is to fit out for the Mediterranean regattas, and is to have new decks. It was rumored some time ago that her owner wished to sell her and build a large racing schooner. That does not, however, appear to be correct. Lord Crawford's fine auxiliary ship, Valhalla, is bound for a cruise in the Pacific. Godwit, a Fife-built 45-tonner, has sailed for Bombay, her owner joining her at Gibraltar. She is a nice cruising yawl and speedy. The passage is being made under her ordinary spars. There is nothing to report about the new challenger, save that the progress known to be made with her promises an early launch.

The best news of the week is an order for a new 52-footer, to be designed by Alfred Mylne, who made a hit this year in the Clyde 36-footer class. The new boat will go far to establish the 52ft. class on a sound basis. The name of the owner, according to the now fashionable custom, is not disclosed. One effect of this has been, in at least one instance, to cause an intending builder of a 65-footer to hold back, as he would not build without knowing who he would have to race against.

Very little interest seems to be taken on your side in the new rule of the New York Y. C. It seems to me to be an extremely troublesome one to put into execution, and not very good, even then. The objection I have to it is that it aims at influencing the shape of a vessel's ends, whereas, I hold that these should be left to develop into the best shape for speed, and that the mid section alone ought to govern their length. If a good, deep body is secured by a rule the ends will cease to be abnormal. Our own rule could easily be altered to produce a splendid type of boat. It also suffers a little from a tendency to influence shape, but that is confined to the mid-section, and I am afraid some designers would disagree with me in saying that it acts harmfully in this respect.



CHAMPION 21-FOOTER LITTLE HASTE—DESIGNED BY W. STARLING BURGESS, 1902.

A launch-racing organization has been established over here, under the name of the Marine Motor Association. Racing is to be adopted as a means of developing the marine motor. The classes are arranged by over-all length—25 and 40ft. for open classes, in which any power and hull dimensions may be used, and the classes for utility boats (yachts, launches, etc.), are 30, 25, 20 and 15ft. o. a., the last being a clencher-built dinghy class. There is to be a minimum beam, freeboard and thickness of planking in these classes and a maximum h. p. Of course, there must be no end of trouble in getting a satisfactory engine measurement, but in time a good result will be obtained. Auxiliary racing will also be encouraged, and that opens up no end of good sport, for it will often entail far more judgment than in racing under sail only.

I hear that in all probability the design of the new large Solent one-design class, promoted by the Earl of Albemarle, will be supplied by Alfred Mylne. I am surprised at this, not because I doubt the ability of the designer, but because these classes are usually designed by one of the naval architects of the district. Mr. Mylne designed the Clyde 20-ton O. D. C. They are good boats, and no doubt he will improve on them for the Solent. It is stated, with some show of probability, that H. R. H., the Prince of Wales, will have a boat in this class. Nothing would do more good to yacht racing than the participation of the Prince, and one-design racing would probably not satisfy him for long.

E. H. HAMILTON.

Some Sea Terms.

MANY aquatic terms explain themselves, such as "rowlock" and "thwart." The latter, conveying the idea of a crossbar, is exactly analogous to the Latin equivalent of "transtrum" (*vide Æneid V.*). In naval architecture the varieties of "clinker" and "carvel" tell their own tale etymologically; in the one build the timbers being clinched, overlapping each other, and in the other being carved, or sliced to a flush surface. But it requires a reference to history of latter day navigation as instructed by Venetian mariners to recognize under "larboard" and "starboard" phonetic corruptions of "villa borda" and "ista borda." A "forecastle" preserves the history of shipbuilding from days when both bows and poop were constructed with castellations for protection in combat, whether against pirates or king's enemies. A cockswain is a character of much greater authority at sea than in boat racing, and hence his designation. A skipper is but a (Dutch) schipper, or shipper; a gunwale, or gunwall, speaks for itself. A thowl, or thole, does not so easily explain itself, but we find the old English verb to "thole," in Chaucer, equivalent to "bear" or "endure." There is also the Gothic "thulan" and Saxon "tolan," of similar meaning. This helps us to throw back to the old Aryan root that crops up in Latin "tollo" and in the irregular perfect of "tuli," and at once gives us a *raison d'être* for a thole of a boat as that which bears the strain of the oar and carries the leather or metal loop which takes the oar to its "support."

The "moorings" of a vessel have a far-fetched derivation, but one which I think is reliable. We have the old Aryan lost word "mawr," or "maha," meaning great, as seen in maha-rajah, in MacCallum More, or in Pen-maen-mawr. Next, the idea of superior size passes to high ground; hence a "moor" is *primâ facie* hill ground. The same, being frequently uncultivated, extends the meaning of the word in due time to any waste land, even though lowlying. But the "moor" ground, as regards an estuary or river channel, continued to mean the elevated bank above tide level. Hence when vessels were small, to "moor" or to "beach" them was one and the same process. Vessels grew in dimensions until their places of repose were floating depths in mid-channel, but the term "moorings" has still stuck to their resting places, although these are no longer aloft and on the high or great ground.—London Field.

Little Haste.

IN this issue there appears the outboard profile and sail plan of Little Haste, champion of the 21ft. class, Massachusetts Y. R. A. The principal dimensions of the yacht's hull and spars follow:

Length—	
Over all	40ft. 0in.
L.W.L.	21ft. 0in.
Overhang—	
Forward	10ft. 0in.
Aft	9ft. 0in.
Breadth—	
Extreme	10ft. 9in.
L.W.L.	10ft. 3in.
Freeboard—	
Bow	2ft. 0in.

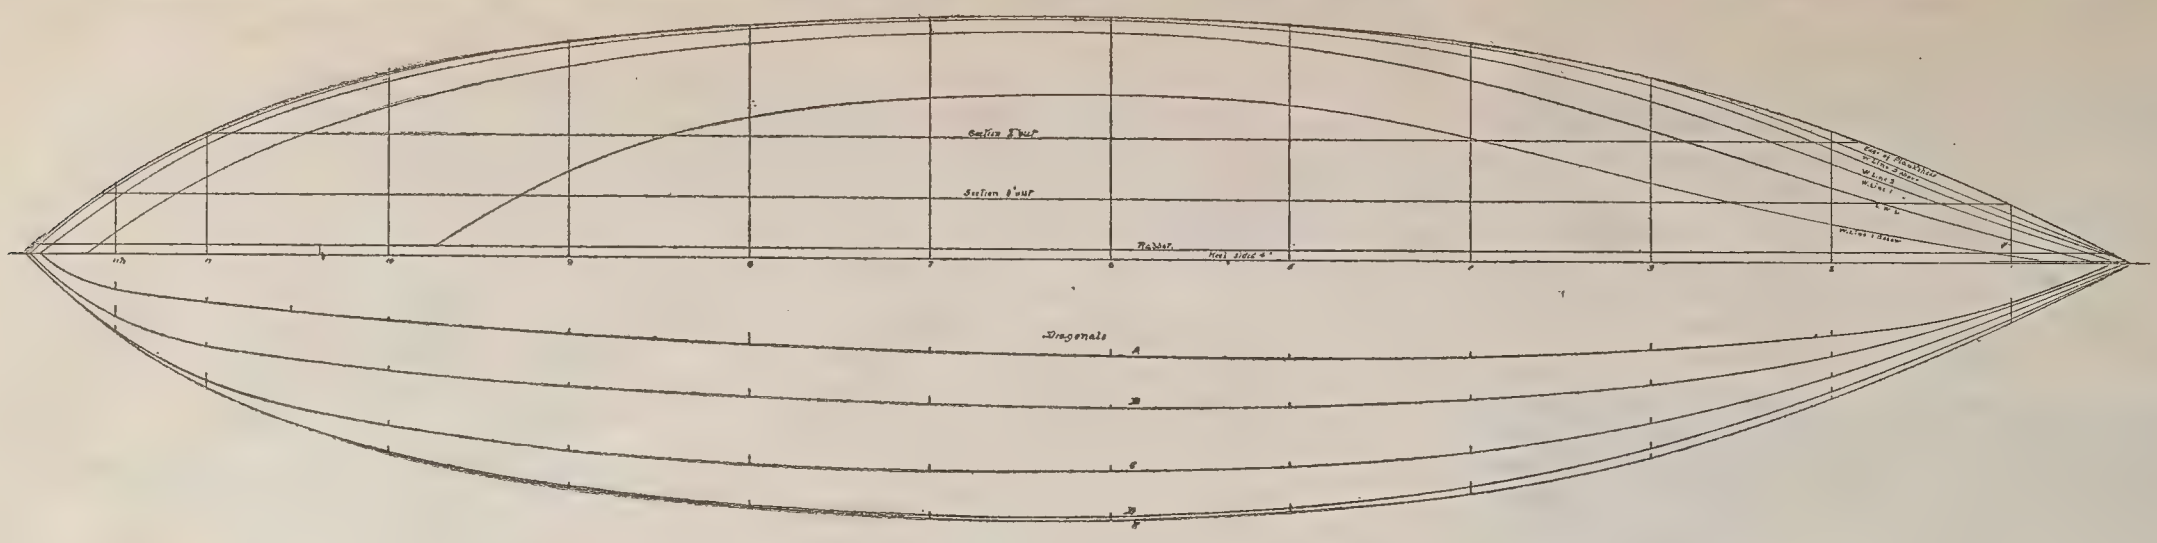
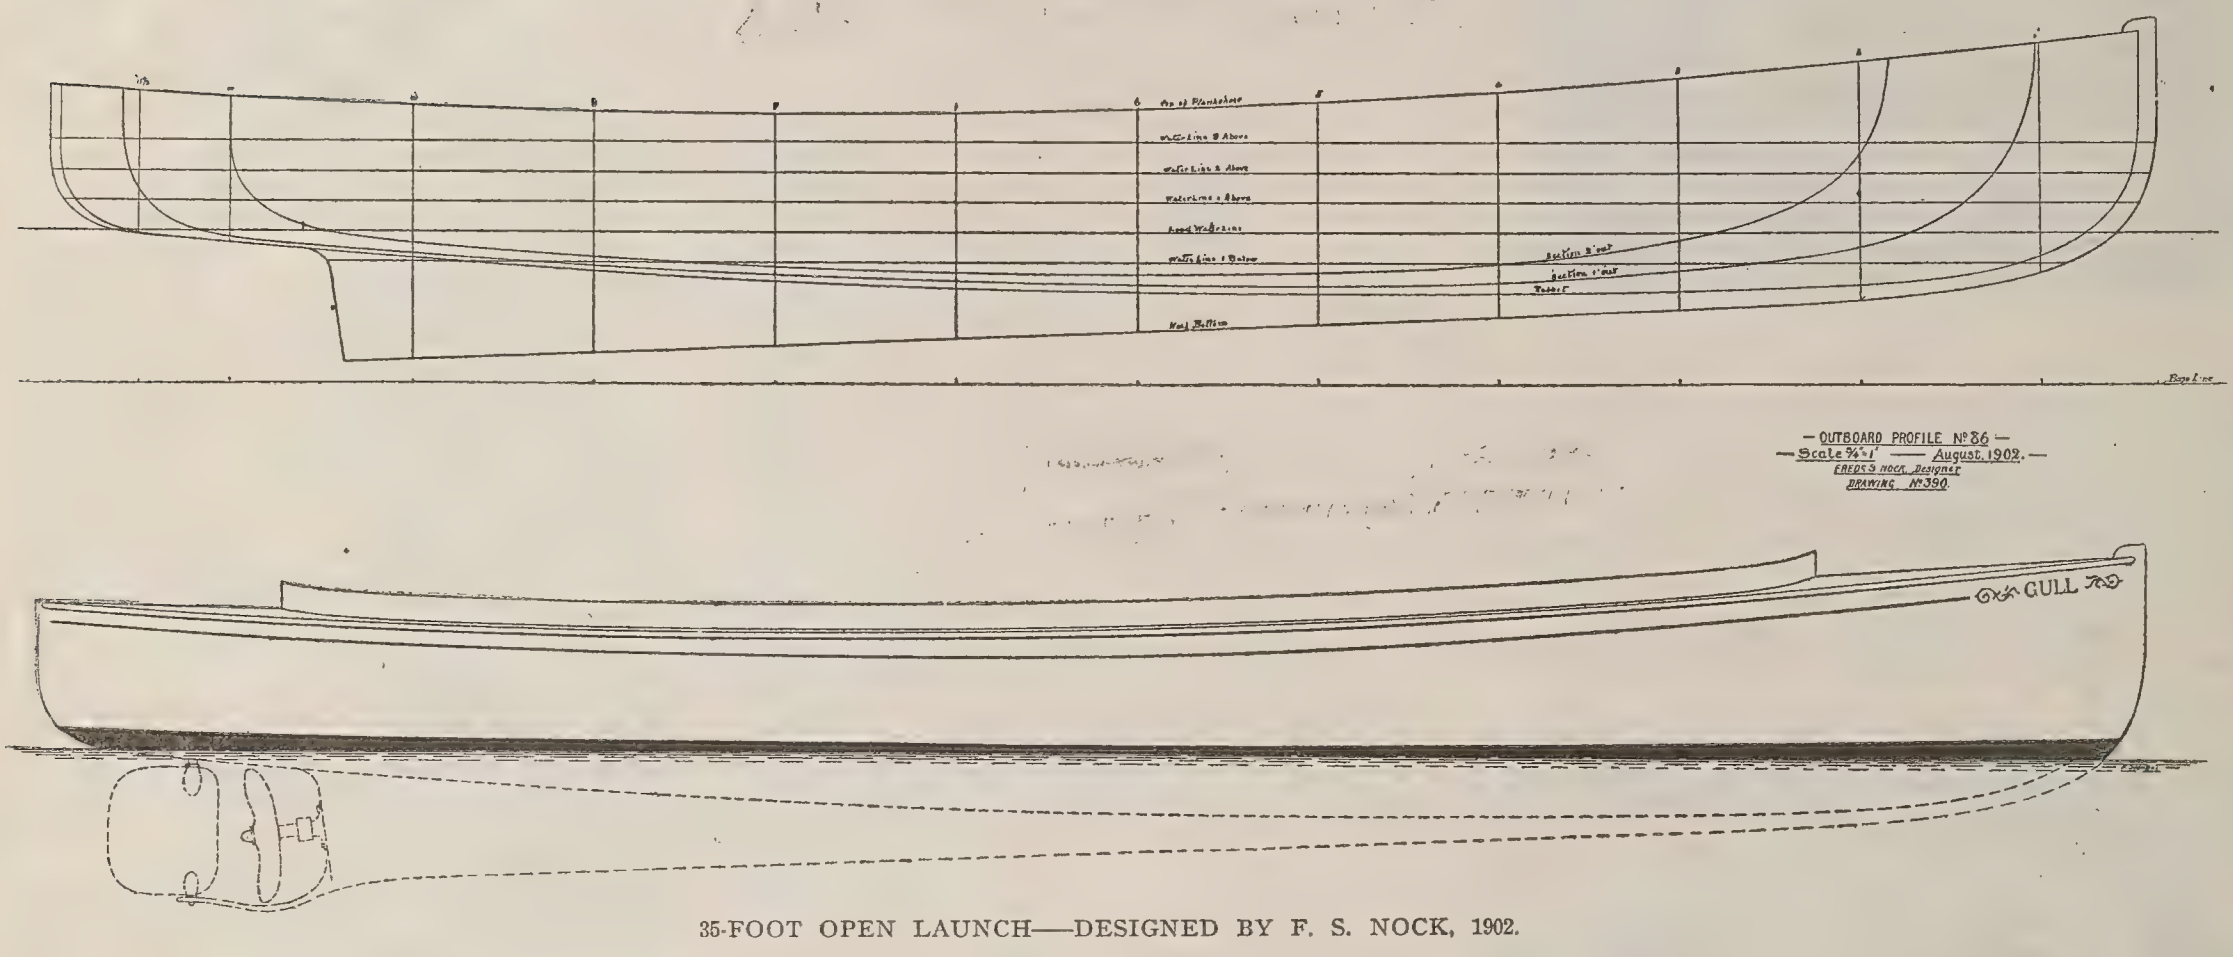
A new yacht club has been organized at Bayonne, to be known as the Bergen Point Y. C. The following officers have been elected: Commodore, A. W. Booth; Vice-Commodore, Midland Borland; Rear Commodore, T. J. Parker; Secretary and Treasurer, W. R. Wilde; Trustees, A. W. Booth, M. S. Borland, T. J. Parker, W. R. Wilde, Henry A. Wheeler, W. W. Genet, J. D. Boyd, Newton H. Day, and Dr. L. F. Donohue. The club starts with 107 members, and they have secured a club house on West Eighth street, Bayonne.

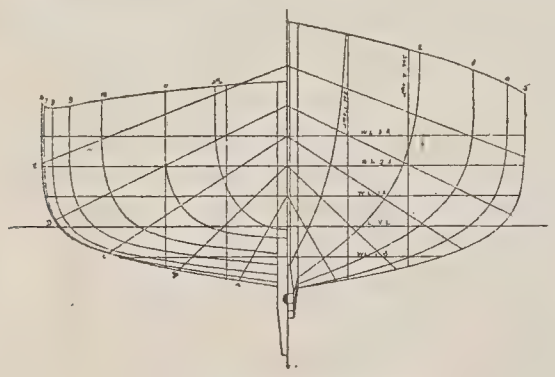




35-FOOT OPEN LAUNCH——DESIGNED BY F. S. NOCK, 1902.

35-Foot Open Launch.

In this issue there appear the plans of a 35ft. over all open launch. The boat was designed by Mr. Fred



35-FOOT OPEN LAUNCH—BODY PLAN.

S. Nock, of West Mystic, Conn. She is a roomy craft and is fast and dry in a seaway. Her dimensions follow:

Length—		
Over all	35ft.	0 in.
L.W.L.	33ft.	3 in.
Overhang—		
Forward	0ft.	8 in.
Aft	1ft.	1 in.
Breadth—		
Extreme	8ft.	0 in.
L.W.L.	7ft.	0 in.
Draft—		
To rabbet	1ft.	0 in.
Extreme	2ft.	3 in.
Freeboard—		
Bow	3ft.	4½in.
Stern	2ft.	4½in.
Least	1ft.	11½in.
Displacement	6,270lbs.	

The boat is well put together and will stand much bad usage. Her keel is of oak sided 4in., the stem and stern are also sided 4in., the frames are of oak 1⅛in. square, spaced 6in. on centers; the planking is of clear white cedar 1in. thick when finished. The motor is a double cylinder 12 horse-power, of the two-cycle type.

YACHT CLUB NOTES.

The annual meeting, election and dinner of the Manhasset Bay Y. C. was held at the Hotel Manhattan, on Tuesday, Dec. 2, over one hundred members and their guests being present.

The report of the secretary showed a total membership of 257, and a fleet enrolled of 154 vessels, by which showing 60 per cent. of the members are yacht owners.

The treasurer's report showed that the past season had been a most successful one financially, and that of the total issue of $35,000, building bonds, $28,000 had been subscribed for. During the evening, the balance remaining, $7,000 were taken up by the members.

The Building Committee reported that the new clubhouse had been completed in accordance with the original plans, and had in every way been found satisfactory, much credit being due the architects, Messrs. Hoppin and Koen, for the planning of the building.

The House Committee reported that the season's business had exceeded their expectations, and that the service given had apparently proven satisfactory to the members, for the reason that but three complaints had been lodged in the complaint book, those relating to minor details.

The Race Committee reported that the club had given three open races during the season, and that all classes scheduled had filled with large entries. This committee recommended that future open races given by the club be sailed over a course from Northeast Execution buoy, over the triangle to Matinicock and Delancey Points, which once around, measures fifteen miles, and the adoption of which will obviate the complaints made by some of the racing skippers, that to win a race at Manhasset Bay required a knowledge of local bay tidal conditions. An additional advantage had, by the adoption of this course, will be the cutting off of about five miles each way, in getting to and from the starting line from the various Sound clubs, which, when there is a light wind on the morning of a race day, often means the loss of many of the boats entered, owing to their inability to reach the starting line in time.

The committee also recommended that for the annual regatta of 1903, all classes be scheduled, instead of, as heretofore, calling only for the boats from 43ft. down.

The Race Committee was authorized to at once print the conditions to govern the races for the Manhasset Bay Y. C. Challenge Cup, by the 30ft. sloop class, and send same to the various clubs, with an invitation to compete for the cup. As all the Bar Harbor 30-footers will race on the Sound next season, and several new boats will be built, this, as a racing class, promises to be the largest of the fleet next summer, and the races for the Challenge Cup should prove most interesting, particularly as the boats will all sail together on the point system, instead as is usually the case, two boats racing together. Although the conditions have not been made public, the club has already received informal notice that four clubs will send representatives, and it is hoped that some of the eastern clubs will send entries.

A photograph of the cup and the conditions to govern the races for it will be published in our issue of next week.

The following officers were elected to serve for the next year:

Commodore, Alphonse H. Alker; Vice-Commodore, Charles W. Lee; Rear Commodore, H. Winslow White; Secretary, Edw. M. MacLellan; Treasurer, Guy W. Buxton; Measurer, Charles D. Mower; Trustees, class of 1905, James R. Thomson, Hazen L. Hoyt.

Amendments to the by-laws were passed, increasing the annual dues to $30, and the initiation fee to $50, and a class of army as well as navy members was provided for.

After considerable discussion the proposed amendment providing a junior class of membership, with annual dues of $15 and no initiation fee, the age limit being thirty years, was tabled until the next meeting.

It has been customary with this club to present the cups won in its races at the annual dinner, but owing to the silversmiths' strike, they were not ready in time, and the Challenge Cup, while on exhibition, was in an unfinished condition.

Among the guests present were A. Bryan Alley, secretary Larchmont Y. C.; George B. Wilson, W. A. Kissam, C. A. Harriman, F. K. Thayer, Anson B. Cole, George A. Corry, Edwin Ayres, Frederick A. Hill, George A. Thayer, John H. Barnard, E. C. De Kay, Henry L. Maxwell, Henry C. Ward, Charles M. Gould, and Commodore Woodward, of the Springfield Y. C.

* * *

The annual meeting of the Shrewsbury Ice Boat and Y. C. was held at Pleasure Bay on Dec. 5, and the following officers were elected:

Commodore, E. W. Reid; Vice-Commodore, Thomas Riddle; Recording Secretary, C. H. C. Clark; Treasurer, John L. Price; Financial Secretary, E. H. Green; Fleet Captain, George P. Joline; Measurers, H. L. Seaman and Thomas Riddle; Trustees, T. V. Arrowsmith, T. E. Hoyt, A. Patterson and Theodore Joline.

* * *

The Regatta Committee of the Larchmont Y. C. announces that the spring regatta for next season will be held on Saturday, June 13, and the annual regatta will be sailed on July 4. This will also mark the beginning of "race week."

The racing season on the Sound will open with the special regatta of the Huguenot Y. C., on Saturday, May 16. The special regatta of the New Rochelle Y. C. will be held the following Saturday, May 23, and on May 30, Decoration Day, regattas will be given by the Seawanhaka-Corinthian, Indian Harbor, Harlem and Bridgeport Y. C.s.

YACHTING NEWS NOTES.

The contract for the Red Bank Y. C., one design class, has been placed by the designers, Messrs. Herreshoff & Wells, with the Metropolitan Boat and Launch Co., of Astoria, L. I. Eight boats have already been ordered and all will be completed and ready to be turned over to the owners on May 15 of next year. The boats are intended for afternoon sailing and racing on the Shrewsbury River. Owing to the shallowness of the water in parts of the river it was found advisable to limit the draft to 20in. The boats are 28ft. 3in. over all, 18ft. waterline, 7ft. 3in. breadth, 20in. draft of hull, and 5ft. 6in. draft with board down.

* * *

At Wood's yard, City Island, there is building a 35ft. waterline yawl for Mr. H. G. S. Noble from designs made by Messrs. Gardner & Cox.

* * *

Mr. Arthur Masters, of New York city, has gotten out plans of an auxiliary schooner for a New York yachtsman. She is 70ft. waterline, 23ft. breadth and 6ft. draft.

* * *

The Holmes Shipbuilding Co., of West Mystic,

Conn., is building a cruising launch from designs made by Messrs. Herreshoff & Wells. The boat is 36ft. over all and 8ft. 6in. breadth. She will be equipped with a 10-horsepower engine, which will give her a speed of nine miles an hour.

F. E. Wicks, of Amityville, L. I., has received an order for a catboat 27ft. long over all, from Mr. Duncan Stewart, of New York city. Work on the catboat building at this yard for Mr. Frederick B. Dalzell, of Brooklyn, is well advanced.

James Brown, of Tonawanda, N. Y., is building a steam yacht for Mr. T. Shirale, of Buffalo. She is 90ft. long over all and 20ft. breadth.

Mr. Fred W. Martin, of Waukegan, Ill., has gotten out plans of a 71ft. steam yacht for Mr. F. F. Stanley, of Boston. The new boat will take the place of the yawl Narkeeta, designed by Mr. Martin for Mr. Stanley. Mr. Martin has also designed a gasoline launch for Mr. Allison P. Fuller, of Brighton, N. Y.

The Marine Construction & Dry Dock Co., of Mariner's Harbor, Staten Island, is to build a wooden steam yacht from designs made by Mr. T. W. Millard, of New York city. She is 116ft. long, 17ft. breadth and 9ft. depth. The yacht's engines will be built by Messrs. Alexander Miller & Bro., Jersey City, and she will have Almy water tube boilers.

On Saturday, Dec. 6, there was launched from the yard of the Nilson Yacht Building Co., Baltimore, Md., the yacht built by that firm for Messrs. Richard P. Hart and Henry Burden, 2d, both of New York city. The vessel, which is sort of a combination house boat and steam yacht, was designed by Messrs. Tams, Lemoine & Crane, and she will be used in southern waters. The first cruise the owners are to make in her will be up the Amazon River. She is known as the Constant. After the launching she was towed to the Baltimore Dry Dock and Shipbuilding Co.'s yard at Locust Point, where she will receive her engines and boilers. Constant is 126ft. 6in. over all, 110ft. waterline, 20ft. breadth and 6ft. 6in. draft.

The 100ft. steam yacht that was designed and built by the Herreshoff Mfg. Co. for Mr. Morton F. Plant, was launched on Thanksgiving Day. She was named Claudia. The Herreshoffs have received fifteen orders for boats in the new Bar Harbor one design class. They are 31ft. on the waterline and about 50ft. long over all. One boat has been completed and is now ready for a trial spin.

Mr. Robert Jacob has recently received a contract to build at his yard at City Island, a steel steam yacht for Mr. Spencer Kellogg, of Buffalo. The yacht was designed by Mr. Henry J. Gielow, and will be built under his supervision. The boat, which is to be completed by June 15, 1903, will be 126ft. 8in. over all, 101ft. waterline, 16ft. breadth and 6ft. 10in. draft. She is to be built of steel throughout and will have a flush deck and two mahogany deck houses. In the forward house is the dining saloon, the butler's pantry and the captain's room. The saloon occupies the forward end of the house, on the starboard side aft is the pantry, and the captain's room opposite on the port side. Twelve persons can be served in the dining saloon, and the pantry has direct connection with the galley, which is just below. The after house is to be used as a sort of living room. A staircase gives access to the staterooms and bathrooms, which are on the deck below. Directly aft of the machinery space, which is about amidships, is a large stateroom for the owner and his wife, running the full width of the boat. On the port side aft are two staterooms, and opposite on the starboard side of the passage is a bathroom, another stateroom and a lavatory. Occupying the after part of the yacht is another double stateroom, which also extends the full width and is 8ft. 6in. long. All the staterooms are finished in white pine enameled, with mahogany doors and trim. The plumbing is of the latest and most approved design. Forward of the engine space is the gallery and staterooms for the engineer, mate, etc. The forecastle is roomy and well ventilated.

The machinery consists of a triple expansion engine and two water tube boilers. This power will drive the yacht at fifteen miles for ordinary running, and eighteen miles under moderate forced draught. Electricity will be used for lighting the yacht.

She will be steered from the bridge, which is on top of the forward house. She is fitted with two pole masts, and three boats are swung on the davits—a launch, a gig and a dinghy.

The Gas Engine and Power Co. and Seabury & Co., of Morris Heights, have received orders for two new steam yachts of moderate size. The larger of the two is for Mr. Alfred Marshall, of New York city. She is similar in design to the boat building by the same firm for Mr. Howard Gould, which was described in these columns a few weeks ago. Mr. Marshall's boat is to be built of wood, her frames are to be of oak and she will be doubled planked with cedar. The yacht will be lighted by electricity, and will have a speed of twenty miles. She will be ready for delivery on May 15, 1903.

The other boat is for Mr. Walter E. Duryea. She is somewhat smaller than Mr. Marshall's boat, being 65ft. long over all. The yacht will be completed by June 1, 1903, and her owner will use her almost entirely for cruising.

At the Herreshoff plant the frames for the 130ft. steam yacht building for Mr. Shilah R. Van Duser, have been set up in the North shop, and the work of planking has commenced. The yacht is very similar in design to Duquense, a vessel turned out by the Herreshoffs several years ago.

Mr. A. Appleton Packard, late superintendent of the Herreshoff Manufacturing Company, has entered into partnership with Mr. W. Starling Burgess, and they will carry on the business of naval architects and engineers under the name of Burgess & Packard, at 15 Exchange street, Boston, Mass.

Rifle Range and Gallery.

Cincinnati Rifle Association.

THE following scores were made by members of this Association on Nov. 23, 200yds., off-hand, Standard target. Some very good scores were made. Mr. Hasenzahl's shooting was very fine, having made three scores in the 90s. Mr. Odell has made his first 91, with a fair promise of doing better. Uckotter, Jr, a young member, has also made a score of 91, and showing his father the kind of metal that is in him.

Hasenzahl	94	92	90	87	85	28

Honor target: Gindele 27, Payne 28, Odell 24, Nestler 30, Hoffman 20, Lux 24, Hofer 14, Jonscher 24, Freitag 19, H. Uckotter 20, Trounstine 22, Topf 18, Drube 20.

Rifle at Ossining.

OSSINING, N. Y., Dec. 8.—In the rifle competition closing Thanksgiving Day, Mrs. E. F. Ball won the ladies' cup by a score of 236. Miss Frances Gibson made a score of 235, which was so nearly 236 that her target was submitted to experts for decision.

A new contest has commenced in the non-members class, the prize being a Winchester repeating rifle, .22cal., with gallery sights, the best two scores of five shots each to win. Re-entries unlimited.

Following are some of the five-shot scores recently made at 50ft. on the ¼in. 25-ring target, with light rifle, coarse sights and smokeless cartridges:

C. H. Sidman, 114, 117, 114, 112, 117; E. F. Ball, 113, 117, 115, 115; C. G. Blandford, 118, 113; Mrs. E. F. Ball, 112, 116; Wm. Fisher, 113.

In a series of matches between C. G. Blandford and E. F. Ball the latter won three out of four.

We are using Smokeless cartridges, entirely owing to the absence of smoke and light report, but they do not seem to give the uniform results that the old black powder ones did. With one brand that we used we would occasionally get a strong one which would give an unusually loud report and would burst the rim of the shell. With another kind we frequently find a cartridge which gives a very light report, and in the opinion of some of the shooters the shots from these strike lower than the others. One of our members injured his rifle last fall by shooting .22-short Smokeless cartridges. After firing a cartridge which gave a very light report, the shot from which failed to strike the object aimed at, he inserted another cartridge and fired, missing again. On his return to camp, while cleaning the rifle, he discovered a dark ring around the bore, about 4in. from the muzzle. The first bullet had stuck at this point, and the second one had struck the obstruction with sufficient force to bulge the barrel.

From our observations it would appear that the powder does not ignite uniformly, probably owing to irregularities in the priming.

We would like to hear from others who have used the .22 Smokeless. E. F. B.

Columbia Pistol and Rifle Club.

SAN FRANCISCO, Nov. 16.—The Columbia Pistol and Rifle Club scores of to-day are as follows:

Columbia target, offhand shooting, 200yds. range:

Rifle: Young, 47; Hovey, 57, 72, 76; H. Hinkel, 61; Mannel, 65; Kroeckel, 82, 89.

Military and repeating rifles, Creedmoor count: Pape, 48, 48, 46; Hovey, 48, 47, 47, 47, 46; H. Hinkel, 48, 45, 44, 44, 43; Twist, 44, 44, 42, 43, 38; Berry, 43, 42, 42, 41; Hoadley, 43.

Pistol, 50yd. range: Brannagan, 36, 38, 41, 42; Barley, 38; Young, 45; Knostman, 48, 60, 61, 63, 64, 67, 69, 73, 73, 76; Hunsaker, 45, 55, 56, 58, 58, 60, 64, 65, 68, 68, 69; Berry, 62; Trego, 67, 70, 71, 72, 85; Gimmel, 67, 71, 72, 73, 74, 75, 84; Allen, 84, 89, 93; Courtright, 86.

Revolver: L. C. Hinkel, 43, 53; Hunsaker, 89.

.22 and .25cal. rifles: Kroeckel, 16, 18, 18, 19, 20, 21, 21, 22, 23; Hoffman 18, 18, 18, 18, 19, 19, 21, 21, 21, 23; Gimmel, 28, 34, 35, 37, 39, 45; Hunsaker, 31, 38, 46. Kroeckel took the lead from Daiss by 1 point, with a total of 179. Hoffman used a Pope-Stevens .25-21, and made best average ever made in one day in club.

Nov. 30.—We held shoot to-day to make up for one lost in early part of the year by flooding of range. Scores, 200yd. range:

Rifle: Young, 49, 50, 50, 55, 58, 58, 59, 59; Dorrell, 54, 69; Hovey, 66, 70; Twist, 121, 134.

Military and repeating rifles, Creedmoor count: Hovey, 47, 47 47; H. Hinkel, 47, 46, 45, 45, 45; Mrs. Hovey, 40.

Pistol, 50yd. range: Brannagan, 36, 41, 44, 47, 51; Barley, 39, 44, 45, 52; Schneider, 51, 64, 73, 76; Hovey, 57; Knostman, 75, 80, 85, 85, 90, 90, 87.

Revolver: H. Hinkel, 43, 54; Brannagan, 51, Hunsaker, 63, 73, 92, 90; Twist, 80, 91.

.22 and 25cal. rifle: Hoffman, 17, 17, 18, 18, 19, 19, 20, 22, 22, 24—196 in ten out of eleven entries; Hunsaker, 28, 31, 32; Allen, 30, 33, 35, 35, 36, 37. Hoffman tied Kroeckel in this match, 179 for the ten best scores of the year, which is the coast record. All were glad to see Dorrell return from his mine for the winter.

FRED. O. YOUNG, Sec'y.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 17-18.—Spirit Lake, Iowa.—Gilbert and Burmister, amateur target and live bird tournament.

Dec. 25.—Dover, N. J.—Holiday live-bird shoot of the Dover Gun Club. Bull shoot the special event.

Dec. 25.—Interstate Park, L. I.—John S. Wright's target tournament, sweepstakes, etc.

Hell Gate Gun Club's shoot, fourth Tuesday of each month (July and December excepted), at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Hell Gate Annex shoot, second Friday of each month (January and July excepted), at Dexter Park, Brooklyn.

Brooklyn Gun Club's shoot, Saturdays, at Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

South Side Gun Club's shoot, Saturdays, South Broad street, Newark, N. J., near Lehigh Valley coal depot.

Outwater's grounds, Carlstadt, N. J., Saturdays, live-bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private*6* ing grounds always ready for target matches, club shoots or private practice.

1903.

Jan. 1.—Poughkeepsie, N. Y.—Inter-county shoot and tournament of the Poughkeepsie Gun Club. Max Condit, Capt.

Jan. 1.—Paterson, N. J.—Open live-bird shoot of the Jackson Park Gun Club.

Jan. 1.—Rutherford, N. J.—New Year's day live-bird and target shoot of the Boiling Springs Fishing and Gun Club. C. B. Axford, Sec'y.

Jan. 1.—Interstate Park, L. I.—New Year's Day target tournament.

Feb. 9-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club. Percy S. Benedict, Sec'y.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The Poughkeepsie, N. Y., Gun Club announces a holiday shoot for Jan. 1, the title of which is "the Inter-county shoot and tournament." The Inter-county contest is open to seven-man teams from Westchester, Rochland, Orange and Dutchess counties. There are five other events on the programme, of which No. 3 is at 100 targets, $10 entrance, high guns, open to the world. The other events are at 15 targets, $1.30 entrance. Shooting commences at 10 o'clock. Targets, 2 cents. Ship ammunition to H. E. Winans, 16 Washington street. Refreshments and ammunition may be obtained on the grounds. Those who so desire may shoot for targets only. Shoot rain or shine. Magautrap. Mr. Max Condit is the captain.

A correspondent writes us as follows: "On New Year's Day the Jackson Park Gun Club, of Paterson, N. J., will give an all-day shoot, beginning at 10 A. M. sharp. They extend an invitation to the shooters of Greater New York, Jersey City, Newark, and in fact all shooters who can spare the time to come to be our visitors and guests on that day. The club will spare no expense to make it pleasant for all, and to see that every one enjoys himself and has a good day's sport at live birds over the traps, under the leadership of Capt. Charles Lenone and the members of the Jackson Park Gun Club."

The following notice, concerning a change of dates, is of general interest to trapshooters: "The amateur target and live-bird handicap tournament, announced by Messrs. Fred Gilbert and John Burmister, to be held at Spirit Lake, Iowa, Dec. 12 and 13, has been postponed to Dec. 17 and 18. The programme will be carried out as previously announced."

The secretary, Mr. C. B. Axford, writes us as follows: "The Boiling Springs Fishing and Gun Club, of Rutherford, N. J., will hold a live-bird shoot on New Year's Day, Jan. 1, 1903. We will have plenty of good birds on hand. We will begin at 10 A. M., and if time permits will shoot targets afterward."

The secretary, Mr. Percy S. Benedict, writes us as follows: "The first tournament of 1903 of the Mississippi Valley Trapshooters' and Game Protective Association will be held under the auspices of the City Park Gun Club, at New Orleans, La., Feb. 20 and 21, Carnival week. Added money to be announced later."

Mr. R. S. Waddell, general sales agent of Messrs. E. I. du Pont de Nemours & Co., writes us as follows: "We are pleased to announce that our offices have been removed to the three top floors of the Equitable building, Ninth and Market streets, Wilmington, Del., where our friends will be cordially welcomed."

The match which took place on Dec. 4 at New Germantown, N. J., between Messrs. T. W. Morfey, challenger, and J. W. Hoffman, for the live-bird championship of New Jersey, was won by Mr. Morfey. The scores were 23 to 22. Mr. Morfey was thereafter challenged by Mr. J. E. Applegate, of Freneau, N. J.

The New York State shoot for 1903 will be held in Schenectady under the auspices of the Schenectady Gun Club, of which Mr. V. Wallburg is president and captain. The dates will be in June. Full particulars concerning dates and programme will be announced later.

Mr. H. M. Brigham, shooting from scratch, scored the first win on the December cup at the Crescent Athletic Club's shoot on Saturday of last week. He scored 47 out of 50, an excellent performance.

BERNARD WATERS.

Take inventory of the good things in this issue of FOREST AND STREAM. *Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?*

Northern Rambles.

CINCINNATI, O.—Leaving Cincinnati early in September for my annual Northern trip, I reached Grand Rapids, Mich., in time to take part in a very well attended and managed tournament, thereafter which I went on to Battle Creek, Mich., where the Indians held forth in full swing for four days.

Regarding this Indian shoot, I must say that never in my life have I seen such difficult shooting, nor have I ever seen targets thrown as hard and far. One particular trap, from No. 2 set, was sending its targets close to 90 yards, these being measured on a still afternoon. As it blew most of the time it is quite safe to say that with the wind favoring them, many targets were thrown full one hundred yards.

At this shoot all stood at even distance—i. e., 16 yards—so that a fair comparison of the shooting as between the men could readily be made, it being quite clear that when a distance handicap is in force no such conclusion can be attained. Therefore, it may be of interest to know that Mr. Fred Gilbert landed 25 targets ahead of Roll Heikes, who was his nearest competitor, and 36 beyond the redoubtable Billy Crosby, the respective scores being Gilbert 756, Heikes 731, Crosby 720, out of a total of 800 each. Considering the fact that the cream of the shooting talent was at Battle Creek, and all shooting at same mark, Gilbert's victory was certainly a splendid one.

In the next target tournament of importance, at Cincinnati, where the two shooting giants met, both standing at scratch—i. e., 22 yards—the tables were turned, Crosby scoring 472 to Gilbert's 469, each shooting at 510 targets—truly a wonderful performance when the rise is taken into consideration, for it is the veriest twaddle to assert that distance is no handicap, and no one who knows anything about the game has ever been known to make such a statement.

But between these two tournaments one came off at Detroit under the management of our Jack Parker. I say our, because Jack belongs to all of us, and is the only real Jack of auld lang syne. Well, it was here that an exhibition of shooting was given us the like of which will not be seen many times in any man's life, regardless of its duration.

There is a medal known as the Gillman-Barnes trophy, which is shot for every year, and which is to become the property of the man who is fortunate enough to win it three times. This year Messrs. Bates, Gilbert, Jack Parker and Tolsma tied on 15 straight, and then the tie was shot off, Mr. Tolsma going out first, then Parker and now only Bates and Gilbert remained. Gilbert standing at 32 yards and Bates at 31. They kept hammering away until dark. Center shots were the rule, and at last when it seemed that neither could miss, Bates drew a very dark colored bird, which, in the dim light, was a most nasty mark, and missed it. This was his eightieth pigeon on the shoot-off and ninety-fifth including main event. Gilbert killed, so that he ran 95 straight at 32 yards, and had a run of 7 straight in a previous event, making a grand total of 102 pigeons in one continuous run at 32 yards, stopping without a miss; in all probability the world's record at that extreme distance. The birds were good, above the average. Both men made some splendid shots; in fact, it was from start to finish the most stubbornly contested affair the writer has ever seen. While Bates lost, he need never lose any sleep over it, for it ranked him at once as one of the very best and most plucky shots in the world, and no one but Gilbert could have beaten him on that day, and it most positively kept him very busy to do so.

When Mr. Bates first appeared on the scene in the States he captured the Grand American Handicap; but his work in that memorable event is not to be compared to his Detroit performance, for there he stood much closer and the birds were not as good, and he still has the consolation of knowing that 94 pigeons straight at 31 yards is probably as long a run as was ever made, especially when it is known that he had two wins to his credit and needed only this one to finally capture this beautiful trophy.

From Detroit I made the trip to Winnipeg direct, getting there a little later than I intended, as I wanted to get as much chicken and grouse shooting as possible during the season. Well, I got it sure enough, and while we made no record-breaking bags, yet we had great shooting and splendid sport both at grouse and duck, and a little goose shooting as well.

My companions afield were Capt. R. D. MacDonald and Messrs. Putnam, Simpson and Totten, all from Winnipeg, and all men with whom it is a pleasure to shoot.

I was exceedingly fortunate in being honored with an invitation to shoot at Mr. F. H. Brydge's shooting box, situated near the great Manitoba Lake marshes, and there again enjoyed great sport, to say nothing of verifying all I have ever said regarding the serviceability of a good 20-bore gun. Every true sportsman knows, or should know, that it is not the number of birds bagged that constitutes the entire enjoyment of shooting, but rather the companionship of congenial associates and the many pleasant incidents which go so far toward making a shooting trip thoroughly enjoyable. Regarding this particular one, I will say that never in my life have I had so delightful an experience nor have I ever been the recipient of more cordial warm and genuine hospitality. I say this in all truth and sincerity, and the day next year that finds me wending my way to Mr. Brydge's famous shooting box will be one of the red-letter days of my entire life.

Much to my regret, I did not have a favorite opportunity to fully try my 20-bore on geese, so I will have to wait until some other time to air my ideas on this subject. But I did make the acquaintance of one of God's noblemen in the person of Mr. James Westcott, at whose house I stayed, and under whose guidance I made several efforts to get some shooting. We did all that could be done, but unfortunately could not locate these wary birds. So, although our pits were dug en regle in spots which seemed must be the best, yet something happened, so that very little execution was done by either of us. Mr. Westcott bagged, I think, six, while I could account for only three. However, it is worth going many a mile to meet so grand and good a sportsman, and I will never forget the many favors extended me while his guest. Men of his stamp are scarce, and I believe always were, for many of the very best—his kind, you know—die young.

Trapshooting at Winnipeg has been very active during the whole season, and, as usual, Mr. Frank G. Simpson has carried off the honors at both gun clubs. His trapshooting this season was of highest order, while his game shooting is on a par even though he has but recently commenced using a 20-gauge gun.

From Winnipeg, Mr. Putnam and I journeyed to Edmonton, Alberta, Canada, making our first stop at Calgary, 800 miles west of Winnipeg. Edmonton, being 200 miles north of Calgary, was our objective point.

At Calgary we were entertained by a lot of men whose chief enjoyment seems to be the making of others feel comfortable and happy, so of course we had a regular jubilee there.

Mr. W. Herbert Heald is the leading spirit in shooting affairs in those parts, and the man who would supplant him has never been born. He is the king pin of the shooting element, organizes the best shooting parties afield, leads the score at the traps, is the mainspring and raison d'être of the Calgary Gun Club, and to sum it up, is a thorough-going sportsman, crack shot with rifle, pistol or shotgun. He breaks his own dogs and shooting horses, and none are as good as his. He mends his own guns, manages the traps, prescribes for all of his friends' sick horses and dogs, and should the painful necessity arise, nurses and watches at the bedside of his friends in life and unto death; up to the very last, night and day—untiring, unselfish. Kind and thoughtful as a mother caring for her sick child, this British giant of tenderest heart and most gentle hand. But, mark you, those tremendous arms have at their ends a fist that comes down like a maul, and they have thrashed a big bully until the hospital was his only abiding place for many a week; not once, but twice, and are ready to do it again whenever occasion may require.

Such, then, is the Chevalier Heald, now of Calgary, erstwhile of the wide world, originally of England, always a sportsman, a polished, highly educated man of the world, fortunately one of leisure, the idol of the Calgary shooting contingent.

When at Calgary last year I was struck at once with the natural advantages and beautiful location of its gun club, and wrote my impressions at the time. This year another surprise awaited me in the way of a tower ninety odd feet high, from which targets are thrown, giving one the benefit of practice at overhead shooting, by far the most difficult of all. At present this tower has but one expert trap 85 feet from the ground, but when a stronger and more suitable one has been built, it is the intention to place several expert traps at varying distances from the ground—say one at 20 feet, throwing an extreme right angle; one at 40 feet, a left; one at 60 feet a quarterer anywhere, and a magazine trap on top at 85 feet, throwing at all incoming angles. Electric wires will then be attached to all of these traps, and concentrate into one pulling box, so that the puller may release any target from any trap, giving thereby the shooter standing, say, 20 to 25 yards from the base of the tower, a most varied and difficult assortment of flights, and affording, as it must, the most diversified kind of shooting.

While at Calgary we had tower shooting, magazine trapshooting and pigeon shooting, the latter from five scoop traps, which make good birds of indifferent ones, and screamers of fast pigeons, as we all know. The entire arrangement and management of the Calgary Gun Club is in the hands of Mr. Heald, and he is, so far as the writer knows, the first, and only, man who has succeeded in putting up a tower on this side of the Atlantic. Surely some of our large clubs, if but to break the monotony of the present style, might with profit emulate his example.

Shooting from a tower at targets, all thrown as incomers, is difficult enough, as any one will soon discover upon trial; but when other traps are set at different heights to throw at all angles and elevations, then it certainly will be a much more complicated game, and one which is bound to teach valuable points when brought to bear in actual game shooting. It does seem a remarkable thing that at so remote a point the initiative should have been taken in what must appeal to any sportsman as a move in the right direction, and serves to prove that one good man at the head of a gun club can accomplish wonders, provided he has the confidence and support of all its members. Alas, how few gun clubs can boast of such a man, and more's the pity, for utter selfishness, favoritism to certain cliques, indifference to all but one's own aggrandisement are so often the basis from which the mismanagement of many clubs have come to grief. A few men of Mr. Heald's type scattered over the country would give an impetus to shooting matters such as it never has had, because every move he makes is solely with a view of making the sport of target shooting more attractive, relieving it from the monotony of present stereotyped forms, and ultimately rendering the practice of a more practical kind, thereby educating men to the freer use of their guns, and training them on correct lines for all kinds of game shooting.

The journey from Calgary to Edmonton was an uneventful one, barring the fact that much game was seen en route; grouse and duck everywhere. At Edmonton no shooting was done, owing to a heavy fall of snow, and weather turning suddenly very cold. I understand they have a gun club there; unfortunately the town has extended in the direction where the traps once stood, so that now another place will have to be selected. I am promising myself the pleasure of another trip that way next year, and hope to report more fully, and I am sure that with such enthusiasts as Messrs. Mercer and Morris a good club will boom along there next spring.

On our return trip to Winnipeg via Calgary we had more trapshooting at latter point, although, goodness knows, the weather was too cold for comfort. On this occasion Messrs. Heald and Comer succeeded in capturing two merchandise prizes donated to the clubs by admiring friends.

What struck the writer as quite remarkable was the spectacle of getting nearly within shooting distance of a band of about 200 antelope at a point say twenty-five miles west of Medicine Hat on the Canadian Pacific Railroad. The sight of these beautiful animals carried me back to my old frontier days when serving with Custer's regiment, the valiant Seventh U. S. Cavalry, during the campaign of 1878 and 1879, when pursuing the Nez Percés Indians, and the fugitive Cheyennes. We saw many small groups beside this big one, numbering from six to eighteen or twenty; but so large a band was quite an unexpected treat. Numerous coyotes were seen, some of which trotted leisurely off, while others stood their ground and would have offered capital shots had we been prepared to take advantage of them.

To sum up the whole trip, I may say this: It was from every standpoint, business, pleasure and socially, a most pleasant one. The bracing air of that northern land is invigorating and bracing to a remarkable degree, and one feels all the better for having breathed it. The people are hospitable, kind-hearted, and to those who are fond of sport always ready to extend a helping hand. Game is abundant, though at the rate the country is being settled up, this may not long endure. The writer divides his year now in two seasons, one up in the British Provinces duck, goose and grouse shooting; the other in Louisiana and Texas, snipe and quail shooting. Quite a long span, it is true, both as to time and space, but extremely enjoyable from the fact that in September I can shoot in the north, and when that is over I can look forward to another opportunity in March in the far South; but above all, in knowing that I have warm friends at each extremity—and I trust many in between—to all of whom I extend a hearty greeting, and for all of whom I wish health, prosperity, a merry Christmas and a happy New Year. GAUCHO.

IN NEW JERSEY.

Nishoyne Gun Club.

Orange, N. J.—In addition to the regular open shoot held on Dec. 6, on the High street grounds of the Nishoyne Gun Club, of Orange, there was a handicap prize shoot. Dr. G. W. Wakeley, with a handicap of 7, at 25 targets won. Two others tied Dr. Wakeley in the preliminary trials. C. L. Smith broke 22 targets and R. B. Baldwin broke 22, which with their handicaps made 25. The first prize was a hunting coat. The second prize was won by Dr. D. Curtis, and the third prize was won by A. Mosler, 20.

In the regular open events the following scores were made:

First event: O. Yeomans 24, R. B. Baldwin 22, A. Mosler 14.

Second event: O. Yeomans 23, A. Mosler 21, C. L. Smith 18.

Third event: Dr. G. W. Wakeley 23, R. B. Baldwin 22, C. L. Smith 22, O. Yeomans 22, A. Mosler 20.

Fourth event: C. L. Smith 19, J. C. Pearce 18, F. J. Miller 15.

Fifth event: A. Mosler 21, Dr. G. W. Wakeley 21, C. L. Smith 20, Dr. D. Curtis 19.

Championship of New Jersey.

Morfey and Hoffman.

New Germantown, Pa., Dec. 4.—The match for the challenge trophy, emblematic of the championship of New Jersey, was captured by Mr. T. W. Morfey, of Dover, N. J., from Mr. J. W. Hoffman, the holder. The conditions were 25 birds per man, 30 yards rise. The birds were good, and the race was close. It was a tie at the twenty-third bird. Hoffman started off with a miss, and lost his eighth dead out, thereby placing his opponent two in the lead. Morfey lost his eleventh and twelfth dead out, which placed both men on even terms, and they so shot, up to Hoffman's miss of his twenty-fourth. The scores were 23 and 22 in favor or Morfey. The scores:

J W Hoffman	0222222*2222222222222202—22
T W Morfey	2221212121**12211222222222—23

Jackson Park Gun Club.

Paterson, N. J., Dec. 6.—The Jackson Park Gun Club open sweepstake and handicap brought out only seven guns to-day. There was only one visitor from out of town, Marshall Herrington. He came just as we finished shooting. Several of the Paterson boys came out to look on. Garry Hopper pulled the traps this afternoon. He is all right; says it is too slow for him. Guess he will shoot next time. The birds were good. Retrieving was done by Bunn's dog, Nell.

Next Saturday, beside sweepstakes same as to-day, there will be a match between Count Lenone and Arthur Bunn, at 25 birds, $25, 12 o'clock sharp.

The 5-bird events were $3 entrance; 10-bird events, $5:

	No. 1.	No. 2.	No. 3.	No. 4.
Morgan	212*0—3	22210—4	12022—4	2222122212—10
Lenone	11011—4	002*0—1	22211—5	1011***200— 4
Powers	00112—3	21220—4	02111—4	1222211222—10
Hopper	22222—5	22212—5	12022—4	222*21*112— 8
Bunn	2120*—3	02221—4	01122—4	1122101212— 9
Van Houten	22100—3	2*102—3	11001—3	1201211221— 9
W Cristy	....	.....	21120—4	*210122122— 8

Event No. 5, 5 birds: Morgan 5, Lenone 4, Powers 4, Bunn 5, Cristy 5.

Schenectady Gun Club.

SCHENECTADY, N. Y., Dec. 6.—The shoot of the Schenectady Gun Club to-day was of unusual interest. The Ferguson silver cup was contested for in a 100-target event. It was won by Mr. S. K. Warnick, with a score of 92.

The race between Messrs. Warnick, H. E. Greene, A. A. Green, E. Berg, and H. H. Valentine in the contest was particularly close and exciting for the first 50 targets. Valentine, Berg and H. E. Greene each broke 45 targets, and A. A. Green and Warnick broke 44 targets out of the 50. Warnick smashed 48 out of the second 50. H. E. Greene and A. A. Green broke 46 each, Berg 44 and Valentine 42, closing the match with Warnick a winner by a single target, and only one target separating the three leaders.

In the afternoon several individual matches took place. To decide ties for position on the first and second teams, Mr. Litchfield withdrew in favor of Mr. Levengston for position on the second team, Mr. M. P. Rice and V. Wallburg shot off their tie for third place on the second team, which was won by Mr. Rice by a score of 23 to 22. The tie for the sixth position on the first steam between Berg and Stewart was decided in Berg's favor, Stewart failing to appear. Mr. Berg then challenged Mr. Borden for fifth position on the first team, which Borden won by the score of 46 to Berg's 45.

J. R. Lovejoy challenged Berg for the sixth position on the first team. Berg won easily by a score of 44 to 39, thus maintaining his position on the first team.

The score of the contest for the champion cup for 1902, is:

Events:	1	2	3	4	Per
Targets:	25	25	25	25	Cent.
S K Warnick	22	22	25	23	.920
H E Greene	23	22	22	24	.910
A A Green	22	22	24	23	.900
E Berg	23	22	22	22	.890
H H Valentine	22	23	20	22	.870
M P Rice	23	22	20	17	.820
S Ferguson	22	19	19	18	.780
J R Lovejoy	24	21	18	..	.840
J M Andrews	22	21	17	..	.800
R L Emmett	22	4	20	..	.746

Other scores made during the afternoon are:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	25	25	25	10	15	Targets:	25	25	25	10	15
J Q Adams	20	11	18	..	..	H J Borden	24	21	..	..	13
W Rice, Jr.	21	18	..	..	..	W H Jackson	..	..	..	5	10
M Grimes	19	..	..	..	..	V Wallburg	..	22	..	..	..

The day was bright and clear, with a moderate, steady wind, and a ground covered with the new-fallen snow.

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, L. I., Dec. 6.—There was quite a good attendance of students at John Wright's weekly shoot to-day. Nine events were shot. Of the contestants, Mr. Harry Welles was easily in the lead in the matter of skillful performance, as will be shown by the scores, which are herewith appended:

Events:	1	2	3	4	5	6	7	8	9
Targets:	10	10	15	10	15	5p	20	5p	15
Welles	8	10	13	10	15	8	18	9	15
J N Borland	9	8	11	8	12	4	14	5	..
Wright	6	7	12	10	10	6	13	5	12
W G Borland	7	7	9	9	12	5	16	8	..
O'Callaghn	4	4	..	5	..	4	6	..	..
Marshall	9	10	10	7	14	9	18	8	14
Gotter	9	9	13	8	13	7	16	7	..
Ainslie	5	3	7	7	8	..	10	4	..
Kissler	4	3	..	6	4	5	8	4	6

Crescent Athletic Club.

Bay Ridge, L. I., Dec. 6.—Mr. H. M. Brigham, one of the scratch men of the Crescent Athletic Club's shooting contingent, scored the first win on the December cup with the very excellent score of 47. There was a rather light attendance. The scores follow:

December cup, 25 targets, handicap allowances as kills; shot off in two strings of 25 targets: H. M. Brigham (0) 47, F. B. Stephenson (1) 46, G. G. Stephenson, Jr., (2) 45, H. B. Vanderveer (3) 34, Daniel C. Bennett (4) 38, W. W. Marshall (6) 39.

Trophy shoots, 15 targets per man, expert traps, handicap: H. M. Brigham (0) 12, F. B. Stephenson (0) 13, H. B. Vanderveer (1) 9, W. W. Marshall (3) 12, D. V. B. Hegeman (2) 14, G. W. Hagedorn (2) 10, G. Notman (2) 15, L. M. Palmer, Jr. (1) 14.

Renewal same conditions: D. V. B. Hegeman (3) 23, G. Notman (4) 23, H. M. Brigham (0) 21, W. W. Marshall (6) 25, H. B. Vanderveer (3) 20, L. M. Palmer, Jr. (2) 20, F. B. Stephenson (1) 20, Dr. J. J. Keyes (1) 16, A. W. Palmer (10) 18, G. W. Hagedorn (3) 17.

The Owl's Head distance handicap, 25 targets: G. Notman (20) 13, L. M. Palmer, Jr. (20) 11, Dr. J. J. Keyes (21) 10, H. M. Brigham (22) 9, F. B. Stephenson (21) 8, G. G. Stephenson, Jr. (20) 5, W. W. Marshall (16) 8.

Scratch sweepstake contest, 25 targets: F. B. Stephenson 20, D. C. Bennett 10, G. Stephenson, Jr., 16, H. M. Brigham 16.

Renewal, same conditions: L. M. Palmer, Jr., 20, D. V. B. Hegeman 19, G. G. Stephenson 16, G. W. Hagedorn 16, W. W. Marshall 15.

Twenty-five targets, same conditions: D. V. B. Hegeman 19, G. Notman 17, Hagedorn 13, L. M. Palmer, Jr., 16.

Same conditions: Brigham 17, G. G. Stephenson 15, W. W. Marshall 15, A. W. Palmer.

A. and S. G. A. Show.

DETROIT, Mich., Dec. 1.—*Editor Forest and Stream:* The second annual Automobile and Sporting Goods Association show will be held here next February from the 9th to the 14th inclusive; also in connection with this show it is proposed to hold at the Russel House grounds a trapshooting tournament; first three days at targets, thrown from expert traps, and fourth day at live birds. Traps to be ready for practice Monday, the 9th, but programme to commence Tuesday, the 10th, continue Wednesday and Thursday. On Friday, live-bird day, it is proposed by the Association officers, providing they receive proper encouragement from the shooting fraternity, to make as the principal event, a 25-bird race to be called the Great Western Handicap at Live Birds, for a trophy to be presented by the Association, and such entrance and division of moneys as shall be determined on by Mr. John Parker who is to have complete control of the shoot when he returns from the South, where he is at present absent on a business trip. The shoot will be open to all on a handicap basis.

The decision of the Interstate Association not to hold the Grand American Handicap at live birds next spring makes it possible for this shoot to be especially attractive to those who would otherwise miss their pilgrimage to the shrine of the trapshooting fraternity. I am requested by the Association officers to request you to lay this matter before your readers in such form as you would deem wise, requesting all those interested in this shoot to address Mr. John Parker, 465 Junction avenue, or Mr. Senec G. Lewis, P. O. Box 5. E. J. CODY.

Ossining Gun Club.

OSSINING, N. Y.—No inducements were offered in the way of cups, etc., for to-day's shooting of the Ossining Gun Club, so the attendance was rather slim. It is astonishing how quick the members educated themselves to the expectation of prizes. Were it not for some of our good friends helping us out occasionally in this respect we would be at a loss what to offer to keep up the interest in the sport.

Mr. F. Brandreth, who in the past has been particularly generous in offering trophies, has presented four cups to be shot for in a winter series.

The first shoot, open to all members, and a handicap at 25 birds, will take place on Saturday, Dec. 20. Those aspiring to shoot on the team against the Poughkeepsie Gun Club on New Year Day, are earnestly requested to be present at this shoot, as well as all other members who want to try for this pretty prize, useful as well as ornamental. Aside from the honor of being one of the first eight shots in a club of 118 members, the pleasure of associating with the kind of men one meets at these team shoots is stimulus enough to bring some of us out every Saturday afternoon to keep in practice. The only shooters on the grounds to-day were Bedell, Edgers and Blandford; the latter brought his gun, the others came from force of habit, but could not resist the temptation of trying a string with Blandford's gun, the results of which would not look good in print. Shells and guns are always to be had on the grounds Saturday afternoons; the first by purchase; the second for the asking. C. G. B.

Visitors.

Within the past few days, New York has been favored with the presence of sportsmen of national fame. Mr. Irby Bennett, ever debonair and alert, was here, there and everywhere. Mr. C. Beveridge (the Dominie), fresh from the pure air of Nebraska and looking the picture of health and contentment, visited many New York friends last week. The redoubtable Daddy 'em All, Mr. R. O. Heikes, and his son Horace, are making a visit of several days' duration. The irrepressible Mr. Phil Bekeart, of San Francisco, was a host in himself. Mr. J. S. Fanning was of the group till Saturday last, the day he had fixed upon for his departure to California for a three-months' stay in that land of sunshine and flowers. He travels by the way of the Southern route. Mr. Harold Money was in evidence also, and is pleasing to relate, his eye is rapidly recovering from the accidental injury to it from a stray pellet of shot, and with a few days' more rest it will be good as new. On Tuesday of this week Mr. Elmer E. Shaner, mighty in deeds of tournament management, came to New York and will here remain till after the Interstate Association meeting on Thursday of this week.

Modern Methods of Gun-Making.

The Manufacture of Iron for Gun Barrels.

From "The Gun and Its Development," by W. W. Greener.

Gun barrels may be made of plain iron, but as shotgun barrels they are worthless with modern explosives. They may be made from solid steel, as are rifle barrels, or they may be made of figured iron—that is, of a mixture of iron and steel.

The method of producing this special material is as follows: Pig-iron obtained from a mixture of the best ores is placed in a furnace, melted, and cleansed from all dross by puddling—the dross, being much lighter than the iron, rises to the surface and is skimmed off. When sufficiently cleansed, the draw-plates of the furnace are lowered, the heat reduced thereby, and the liquid iron while cooling gathered and worked into blooms about one hundredweight each. The puddler takes the bloom with a pair of tongs, runs with it to the tilt hammer and hands it over to the shingler, who, by dexterously turning the metal under the hammer, forms it into a square block and passes it to the roller; it is then passed through the various rolls until of the required size, and drawn out into a bar of about ten feet in length. The hammering under the heavy tilt condenses the metal and causes the dross and scale to fly off. The rolling increases its ductility and tenacity by elongating the fibre.

If scrap steel is used, it is treated in the same way. But if new metal is employed, the finest qualities of rolled bars are chosen; the steels suitable are open hearth and ingot steels produced by modern methods, if low in carbon. On account of its purity and uniformity, best Swedish steel is most usually preferred. Steel is not improved by puddling.

Iron is improved—that is to say, purified—by the processs of puddling; so it is usual to take bars of puddled iron, cut them into short lengths, and pile them into faggots. These faggots are heated in the draught furnace, welded under the tilt hammer, and the block of metal is reheated and hammered for the manufacture of the best barrels, to condense the fibre of the metal and increase the specific gravity. After being hammered, the

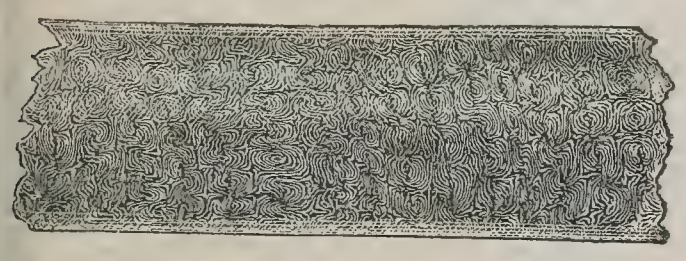
Silver-steel Damascus Barrel.

blocks are rolled out into bars; these bars are again cut into equal lengths, laid and fastened into faggots, heated in the furnace, and welded together and rolled into thin, narrow strips. In the above process the ends of the bloom, or extremities of the rods, are cut off and thrown aside, being less dense, and consequently useless for gun iron.

The loss in the puddling is about 15 per cent., in the shingling and rolling about 14 per cent.; in reheating the metal it also loses considerably, making a loss of about 40 per cent. in those three processes alone; and there are successions of similar losses in each further stage of the manufacture of iron. The proportionate amount of the different descriptions of metals in a barrel determine its quality. The old-fashioned laminated steel was composed of nearly three parts of steel; best English Damascus and modern laminated steel contain over 60 per cent. of steel; and the best silver-steel Damascus contains nearly 75 per cent. of the best worked steel. The amount of steel is determined upon before making the metal into faggots for the last time; if for scelp barrels, the strips of iron are twice the thickness of the steel, the faggots being formed of alternate layers of iron and steel. In single iron Damascus barrels the proportion of iron used is not much less than the steel, but the metal for these common barrels does not pass through quite so many processes as that for the best barrels, and although far superior in quality to ordinary iron, its tenacity and specific gravity is not so great as that of the very best gun iron. In best Damascus barrels the iron and steel are mixed together systematically.

In the piling of the iron and steel, it is possible to so arrange the metals that many different figures—that is to say, direction of the grain of the metal—result. In the best silver-steel Damascus, used by the author, the exact proportions of iron and steel used are such as have been found by experiment to give the greatest strength; the figure is fine and uniform. By using more iron than steel, and keeping to the same arrangement of the metals, a very inferior barrel would result. The tenacity, durability and beautiful figure of the barrels depend almost entirely on the proportions and arrangement of the steel and iron, the desiderata being the placing of the iron in the best position to give the regular and fine figure of the finished barrel.

In piling the iron for the ordinary Damascus twist strips of iron and steel are laid upon each other alternately. In another figure the iron, in lieu of being in strips, is in rods, which are arranged so that in cross section they resemble a checker board. In producing chain twist, diamond twist, and irregular-figured and fancy-figured barrels the iron rods are differently piled. They



Fine Stripe Belgian Damascus Barrel.

may be of hexagonal section, or rhomboidal, or some square and others parallelopipedonical. Combinations of strips and squares are common on the Continent, where also, instead of plain rods or bars, the iron and steel used for piling is sometimes of V, L, T and other sections or combinations of various figures. There seems to be no limit to the varieties of figure obtainable by the arrangement of the iron and steel in the faggot, and afterward skilfully working the metal.

The next process is to heat and weld the faggot of piled iron and steel and roll they into rods of the sizes required by the welder.

The welder may, for a common barrel, have the metal in the shape of a strip about three-quarters of an inch wide and of rhomboidal section. For a figured barrel it is necessary to have the rods of square section, and to heat them and twist them upon themselves—a process which turns the grain of the alternate strips of iron and steel running logitudinally from end to end of the rod in a spiral direction.

In twisting the rods care is taken to keep the edges of the iron and steel strips to the outside, for it is the twisting of the different metals that gives the various figures in the finished barrel. The steel, being hard, resists the acids, and retains a white or light brown hue, while the iron, or softer metal, is so acted upon by the acid as to be changed into a dark brown or black color. Eighteen pounds of prepared gun iron are required to weld an ordinary pair of 12-gauge barrels, which, when finished, weigh with the ribs, lumps, and loops but little over three and a half pounds. Bearing in mind this fact, and considering the great expense and loss of expensive steel and iron attending the manufacture of the metal, and the cost of welding the best barrels, it will no longer be a matter of wonderment that best guns are so expensive to produce.

Gun Barrel Welding.

The methods practiced in manufacturing Damascus barrels differ but in unimportant details from each other. The welding of barrels by hand is still carried on in the author's factory, and the various processes of barrel making as employed there will be briefly described and illustrated.

The square rods of prepared iron are first twisted to give the Damascus figure. The rods are about four feet long, and are heated in the forge fire until about eighteen inches of the rod is brought to a red heat, when one end is thrust into a square hole in a block made fast to a frame, and the other end fixed into a movable head at the other end of the frame; a rotary motion is then given to the movable head by means of a winch handle and gear wheels; the rod, being square, cannot turn round with the head, so is twisted in itself. The rod is carefully watched while twisting, and should one part commence to twist more rapidly than the other, a man is ready with a pair of tongs to hold that part of the rod, so that it is prevented from twisting. This process is repeated until the whole rod is perfectly twisted, and a regular figure in the barrel insured.

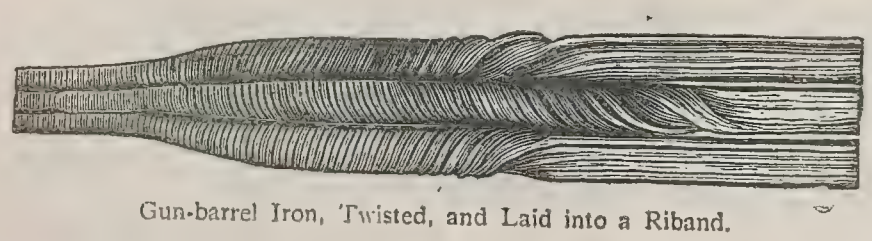
Greener's Solid-Weldless-Twist Gun Barrel.



Gun-barrel Iron, Twisted, and Laid into a Riband.

When finished twisting, the rod will be round, except the squares at each end where held in the block and head, and the four feet rod will have become shortened to about three feet three inches, and have about eight turns to the inch. All Damascus barrels must be made of twisted rods, while plain twist or scelp barrels are made from plain straight rods or ribands.

Without this twisting of the rod the finished barrel would have the appearance of a wire twist barrel, or it might be of a plain barrel if the top or bottom of the rod, instead of one of the sides, was kept to the outside of the barrel. By twisting the metal the grain is so arranged that it appears on the outside of the finished barrel in the form of a number of irregular links or circles.

The rod prepared, it is either joined to other rods or coiled and welded into a barrel singly.

The cheapest Damascus barrels (single iron stub Damascus) are made from a single twisted bar, rolled out into a riband seven-eighths of an inch by one-eighth for the fore end of the barrel and seven-eighths by one-quarter for the breech end.

Two-iron stub Damascus barrels are made from two twisted rods, each three-eighths square, and welded together, and rolled into a riband five-eighths by one-sixteenth for the fore part, and five-eighths by three-sixteenths for the breech end, with the twisted spirals in opposite directions.

Three-iron stub Damascus barrels are made from three twisted rods, each three-eighths by seven-sixteenths, and laid and rolled together with the spirals, as shown in the illustration, forming a riband of one-half inch by seven-sixteenths for the breech ends, and one-half an inch by three-sixteenths for the muzzle piece.

Best laminated steel barrels are twisted, and the rods welded in the same manner as the stub Damascus, but the rods are composed of superior metal containing a larger percentage of steel.

In laminated steel and stub Damascus barrels it is not usual to use more than three rods in their manufacture. Fine Damascus barrels, as manufactured by the Belgians, are occasionally made from four or six rods together, but three are sufficient to give a very fine figure.

The true English Damascus barrel is prepared from three rods, twisted as described and put together as shown in the twisted riband, and is known technically as three-iron Damascus; the silver-steel Damascus is similarly made, but of different metal piled in a different order.

The rods having been twisted and the required number welded together, they are sent to the iron mill and rolled at a red heat into ribands, which have both edges bevelled the same way. There are usually two ribands required for each barrel, one riband or strip to form the breech end, and another, slightly thinner, to form the fore, or muzzle part of the barrel.

Upon receiving the ribands of twisted iron, the welder first proceeds to twist them into a spiral form. This is done upon a machine of simple construction, consisting simply of two iron bars, one fixed and the other loose; in the latter there is a notch or slot to receive one end of the riband. When inserted, the bar is turned round by a winch handle. The fixed bar prevents the riband from going round, so that it is bent and twisted over the movable rod like the pieces of leather round a whip-stock. The loose bar is removed, the spiral taken from it, and the same process repeated with another riband.

The ribands are usually twisted cold, but the breech ends, if heavy, have to be brought to a red heat before it is possible to twist them, no cogs being used. When very heavy barrels are required, three ribands are used—one for the breech end, one for the center, and one for the muzzle piece.

The ends of the ribands, after being twisted into spirals, are drawn out taper and coiled round with the spiral until the extremity is lost, as shown in the representation of a coiled breech piece of Damascus iron.

The coiled riband is next heated, a steel mandrel inserted in the muzzle end, and the coil is welded by hammering. Three men are required—one to hold and turn the coil upon the grooved anvil, and two to strike. The foreman, or the one who holds the coil, has also a small hammer with which he strikes the coil, to show the others in which place to strike. When taken from the fire the coil is first beaten upon an iron plate fixed in the floor, and the end opened upon a swage or the peam of the anvil, to admit of the mandrel being inserted.

When the muzzle or fore-coil has been heated, jumped up, and hammered until thoroughly welded, the breech end or coil, usually about six inches long, is joined to it. The breech coil is first welded in the same manner, and a piece is cut out of each coil; the two ribands are welded together, and the two coils are joined into one, and form a barrel. The two coils being joined, and all the welds made perfect, the barrels are heated, and the surplus metal removed with a float; the barrels are then hammered until they are black or nearly cold, which finishes the process.

This hammering greatly increases the density and tenacity of the metal, and the wear of the barrel depends in a great measure upon its being properly performed.

When the barrels are for breechloaders, the flats are formed on the undersides of the breech ends. If an octagon barrel is re-

quired, it is forged in this form upon a properly shaped anvil; in rifles the barrels are welded from thicker ribands and welded upon smaller mandrels.

Another method of making twist barrels is practiced in Birmingham, and may be shortly described.

The iron is twisted in much the same way as that already described, but steam power is used to turn the winch instead of hand power. The forge fires are blown by a steam fan instead of the old-fashioned bellows, and the welding is done by one man instead of three. This is accompanied by having a tilt-hammer close to the forge regulated to give sharp, quick, short blows, and capable of being thrown in and out of gear with the foot. The welder is also provided with an anvil, swages, mandrels, etc. When he removes the coil from the fire, he has only to knock in a mandrel, straighten the coil on the anvil, jump it close by striking it on the floor in the usual manner, and place it under the tilt, reheating the coil, and repeating the process until the barrel is properly finished. The appearance of barrels so welded is not so good as that of those hammered by hand, but they are strong and sound, and on account of less care and labor being bestowed on their production, they are cheaper than hand-forged barrels.

The latest method of making the plainer twist barrels is to treat the iron for twisting, and the coils, in a furnace instead of a breeze fire. The theory is that the metal is less liable to be burned, the heat being uniform and freedom from grays and faulty welds thereby insured. Experience does not fully bear out the theory. Possibly more can yet be done in this line toward producing a perfectly welded and clear barrel.

Foreign Twist Barrels.

Damascus iron barrels are forged in Belgium and at other gun-making centers of the Continent by the same methods as practiced in England. The chief difference between English and foreign welded barrels exists in the quality of the materials; iron of local manufacture being that generally employed. Another difference is that barrels of a smaller figure and barrels of fancy figures, already alluded to in the paragraph on iron-making, are frequently produced by French, Belgian, and German welders.

Softness is the characteristic of Belgian iron; it is found in all their iron manufactures, and is particularly noticeable and objectionable in their barrels. The welders prefer the soft metal, as being easier to manipulate, welding more freely, and containing fewer surface flaws than hard metal into the composition of which steel largely enters. There is, comparatively, little steel in the Belgian barrel; there are even barrels in which there is no steel, two different qualities of iron serving to produce that distinction which is necessary to produce figure in the finished barrel.

The barrel welders of Belgium are chiefly located at or near Liège. The very best barrel makers who manufacture for the London, Berlin and Vienna markets are to be found at Chaudfontaine or Nessonvaux, both places a few miles from Liège. Their method of welding is much the same as that practiced by the best English welders, but they work at a smaller forge, and instead of breeze, use a mixture of coal dust and clay. The fires being much smaller, the barrels are heated only a few inches at a time, so that greater labor has to be bestowed upon their manufacture.

The greatest care is taken to keep the anvils and tools perfectly clean and free from scale, so that no foreign matter can get between the coils and thus affect the soundness of the welds.

The type of barrel which is peculiarly their own, is the fine figured or six-stripe Damascus; in this the figure is very minute, as shown in the illustration, and is produced in the following manner: The welders take thirty-two alternate bars of iron and steel, and have them rolled into a sheet three sixteenths of an inch in thickness; the sheet is then split by a machine into square rods. These rods are then twisted after the method of the English welders already described, but to such an extent that the rods resemble the threads of a fine screw, there being as many as eighteen complete turns to the inch. Six of these rods are then welded to each other side by side and rolled into a riband, and the result is a figure so fine that it appears no larger than the eye of a needle, and requires special care in browning to obtain markings which can be distinguished.

For these fine barrels and for some others the old plan of welding on a chemise is still in use. The other old plan of plating or welding a thin coating of Damascus iron upon a barrel of plain iron has been abandoned, save for very heavy barrels for duck guns, etc., which are still not infrequently welded of the cheaper scelp, or plain twist iron, then coated with fine figured iron.

The regular Belgian barrel of commerce is the double-iron Damascus, "two-iron," or "Boston"—the same barrel, by whichever designation known. It differs from the English two-iron Damascus in showing fewer white or light-colored streaks, and being usually of coarser figure, obtained by piling larger rods in the faggot and again not rolling them to so small a section as is the practice of the English masters.

At St. Etienne in France, where a manufactory for sporting firearms was founded early in the fifteenth century, the Belgian models are followed and the iron of the district is soft and ductile. One plan much used in this district, but by no means original, is the forming of barrels of two twisted rods to one untwisted; the appearance is that of a "barber's pole," a distinct broad stripe of straight-grained metal running spirally round the barrel from end to end between a broader band of curled Damascus figuring.

The only centers at which Damascus barrels are made are, in addition to those already cited, Brescia in northern Italy, and Suhl in Prussia.

Varieties and Qualities of Twist Barrels.

In the foregoing descriptions of the methods of manufacturing twist barrels it is stated incidentally that some kinds are superior to others. The comparative strength of gun barrels and of the material employed in their manufacture, the merits and disadvantages of chosen varieties, will be found stated in detail later, but as the method of manufacture, as well as the material employed, affect the quality of the barrel, it is advisable to state here that, so far as known, the strongest forged or twist barrel is the laminated steel now usually termed "stub Damascus," made of three twisted rods to the riband.

The word laminated, as the designation of a gun barrel, arose from the fact that early in the century thin strips, plates, or laminæ of steel, piled alternately with iron strips or plates, formed the composite metal from which they were made. They differ from Damascus in so far as the iron and steel are differently arranged in the pile, so that instead of a decided curl in the figure there is only what may be termed "herring bone" lines running spirally round the barrel from end to end. Technically, laminated steel is a name metallurgists apply to faulty steel. It has been used in the gun trade for more than half a century in quite a different sense, as here stated.

By rolling the rods too fine before twisting, by twisting too much, or by twisting to a degree the particular metal so treated will not bear, the material of the finished barrel is weakened. This, apart from any possible faults in the forming—that is, welding and shaping—of the barrel itself.

Over-twisting, over-heating, and the endeavor to produce a fine-looking barrel at a low price result in weakened material.

In the twist barrel the iron and steel must be so arranged that perfect welds may be easily made; and so disposed that the fibers of steel and iron intermingled shall support each other when the strain of the explosion has to be borne by the barrel. Steel of the hardness—that is to say, steel as high in carbon—employed in the manufacture of Damascus iron would be too brittle to withstand the shock of the explosion if used alone; on the other hand, the iron alone would be too soft and the barrel would bulge. By combining the two metals in the best manner, so that neither loses its character, they together give to the twist barrel sufficient hardness to withstand bulging; sufficient elasticity to insure that the barrel, after the expansion produced by the force of the explosion, shall return to its previous caliber, and that high tenacity which prevents the bursting of the barrel by the sudden shock.

The mechanical structure of the twist barrel, not less than the purity of the metals employed, enhances the strength.

Some barrels of good material may have their strength lessened by faulty arrangement of that material, while barrels made of much inferior material will yet be stronger because of the better use made of that material by arranging it with judgment. So far as can be explained, without too greatly indulging in technical minutiæ, the best proportions of iron and steel can be arranged to best advantage in what is known as the three-iron barrel; whether the iron be piled to give a curly figure when twisted, or to give the plain, straight, short-lined figure of the "laminated" steel, is quite immaterial. One is as good as the other. Four-stripe barrels are not so good, unless the barrel is heavier, thicker and larger than ordinary, when of course a point would be reached when the four-stripe would equal the other. In like manner the two-stripe is inferior, though perhaps not to the same extent. The Belgian six-stripe barrels, apart from the softness of the material of which they are made, are over-twisted. Many of the fancy-figured barrels are not improved by the manner in which the iron and steel are combined, but the reverse. The advantage claimed for the St. Etienne barrel, that by the combination of the Damascus with the plain twist greater tenacity in both directions is obtainable, is yet to be proved, while the method is decidedly disadvantageous on other grounds.

In the trials of barrels by the Birmingham Proof House—barrels of thirty-nine different varieties obtainable by the Birmingham trade—the first place is given to the group of English "laminated" steel barrels of three strips. The next best of the twist-barrel groups is the "English Damascus" in two strips; the next the "English hand-forged Damascus" in four strips; then "English two-strip Damascus"; and then "English Damascus" in three strips; then English laminated steel in two strips. The first group of foreign-made twist barrels is the "Pointillé" (a fancy figure), eighteenth down on the list in order of merit; foreign "Damascus Crollé," in three and in four strips, come next, and have the same figure of merit, both being placed twenty-fifth on the list. At the same trials, when individual barrels were tested to bursting or bulging to the extent of .01 inch, the first place in the order of merit was occupied by "English variegated Damascus," two-strip; "English Damascus" three-strip; and "English Damascus," two-strip again, all three barrels withstanding exactly the same test. The foreign "Damascus" two-strip, and the same in three-strip, passed equally to the seventh place, while last in order of merit were the foreign fancy-figured "Pointillé" and the foreign "Crollé Damascus" four-strip barrels.

This report, issued in 1891, only confirms what the author wrote in earlier editions of this book, with respect to the relative strengths of twist-barrels, and has now repeated more concisely.

A figured barrel, notwithstanding the fineness of the figure and the apparently high quality of workmanship, is no indication of trustworthiness much less of excellence and unusual strength. To obtain barrels combining the utmost strength with lightness and beauty the best way is to purchase or order from a gun-maker of repute and leave the choice to him. It is not always that the type of barrel best suited to one caliber or weight will prove so advantageous when used in the construction of guns of other calibers or weights. There is only one wide difference in the practice of the English gun-maker and his continental competitor when choosing a barrel for a particular purpose; with the English maker the figure of the barrel is the last thing to be considered when determining the type most fit for the particular purpose, whereas with the foreign manufacturer it is usually the first, and often the only, consideration. The English maker takes a barrel that will do best; the foreign maker the barrel that will look best.

Weldless Barrels.

In addition to the seemingly large variety of figured barrels, there is now an even greater assortment of weldless barrels available for shotguns. These are, for the most part, of steel; some drilled, some drawn, some forged, of steels of many qualities and made by different processes.

First as to the history of the weldless barrel, and its increasing popularity.

One of the greatest difficulties with which a gun-maker has to contend is the "gray" in gun barrels. The "gray" is a defect of small actual importance, but decidedly a blemish on a fine weapon, and an eyesore in every description of gun barrel.

The numerous twistings and weldings of gun-iron rods and ribands are fully detailed in the description of the barrel-welding processes, and it must have occured to the reader that the Damascus barrel is one mass of welds from breech to muzzle. This is so. Unfortunately a certain amount of burnt metal, or scale, is imbedded within some of these welds, and in the finished barrel this fragment of scale forms a "gray," or small speck of useless material, which will not color in harmony with the other part of the barrel, but is made more apparent by the finishing processes of polishing and browning. These "grays" may appear some time after the gun has been in use, the hard metal composing the barrel being eaten into by rust, or the thin coating over the "gray" being worn away. They are developed in the inside by the chemical action of the powder gases, and are practically ineradicable. Sportsmen must not imagine that "grays" weaken a barrel to any appreciable extent, and their development in a gun, after some months' or some years' wear, in no way reflects upon the reputation of the gun-maker.

A barrel eaten right through with rust, at or near the muzzle, may be fired with perfect safety; consequenktly a "gray" is not to be regarded as an element of danger; and barrels after thirty years' wear, or after firing upward of 100,000 shots, are safe to use, providing they are free from dents, bruises and rust inside. Best quality barrels can be ruined—and many have been—in a couple of seasons by rough, careless usage, firing when dented, and being allowed to rust inside and out.

A welded barrel will not stand a blow given sideways. A knock against a hard substance will dent one barrel and frequently break the other in the weld. Many more guns are ruined by hard knocks than by hard wear.

Owing to the great difficulty in procuring perfectly welded barrels, gun-makers are now discarding tubes of the Damascus variety for those of solid steel, which are free from grays and blemishes, and if carefully chosen and tested will fill every requirement of the sportsman. The harder the Damascus barrel the greater the liability to grays, and a soft barrel will not make a fine shooting gun.

It is possible to have a twisted weldless barrel. Some years ago the author produced his "solid weldless twist," a figured barrel which is admirably adapted for sporting and other rifles and in every way suitable for shotguns. The grain runs spirally and the figure is similar to that of the wire twist. The illustration shows clearly the method of manufacture from ordinary gun-barrel iron. The twisting closes the grain of the iron, making it more dense toward the center, thus presenting an even solid surface for rifling; outside the grain runs spirally from end to end.

Of the steels used for shotgun barrels, the best known is Whitworth's fluid compressed steel. This is a cast steel; the ingot, while in a liquid or a semi-liquid state, is submitted to pressure, with a view to eliminating blow holes. The top and bottom of the ingot is cut off and thrown aside as usual. Eminent metallurgists contend that in the process of cooling the contraction of the ingot is so great that no pressure which can be brought to act upon it by mechanical means can affect the metal—at any rate, beyond a few inches from the surface. The process is therefore by some regarded as quite superfluous. On the other hand, it is generally allowed that the Whitworth steel is of excellent quality, and it has been used for barrels for so many years that its suitability for that purpose may be taken as fully proven.

The Whitworth steel is to be ordinarily distinguished from other steels by its brand, and by that alone. This mark is a "wheat-sheaf," and London gun-makers who have sold guns with these barrels for many years now have their barrels with this registered trade mark stamped on the under side and the ordinary lettering "Whitworth's steel," etc., on the top of the barrel or the top rib. Whitworth steel is higher in carbon than many steels used for gun barrels, but it is sufficiently ductile to allow of drilling.

Steel made by the Siemens-Martin process has been used successfully for shotgun barrels as well as rifles. So, too, tubes of basic open hearth steel, made from hematite pig and scrap, and carburized by Darby's filtration process, were tested at the Birmingham Proof House in the trials already referred to and obtained a high figure of merit.

Steel barrels may be made by drilling them from the ordinary rolled bar; they may be drawn by rolling out pierced blanks; they may even be rolled hollow by the Mannesmann process, or they may be forged, then drilled.

The quality of the barrel depends less upon the method of forming the barrel than the quality of the metal used—the reverse of the twist barrel, where manipulation is all important.

In the choice of a suitable steel, actual experience is a surer guide than the indications of theory as to the composition which ought to be the best for the purpose.

The author uses a brand of metal to which the name of Greener's wrought steel has been given, which steel he has found specially suited to the requirements of the gun-maker for shotgun barels; in this steel the metal is not drawn, but is forged out of a solid bar, and drilled its whole length. Barrels so made are of close metal, stronger and denser than any obtainable by other means.

The "Wrought Steel" recommended is made of a homogeneous metal, of very fine quality, and admirably adapted by its great tenacity, or tensile strength, for use in gun barrels. It has been thoroughly tested by the author, as well as at the Government Proof House, with very heavy charges, viz., 28 drams of powder and 4½ ounces of shot, this charge being equal to seven ordinary charges of powder and four charges of shot. This test and many others it withstands perfectly.

"Wrought steel' barrels are of sufficient strength for all practical purposes, and only in appearance are they at a disadvantage when compared with twisted Damascus and laminated steel barrels.

Unlike "cast steel" barrels of the old type, "wrought steel" barrels bulge instead of breaking, and increased strain produces an open burst similar to that of a welded barrel, instead of a sharp break or a longitudinal rip, as is found to result with imperfect steel barrels. The quality of the metal is such that it will stand successively more than double the strain to which a sportsman can submit his gun with fair usage. And it will not "rip" or "crack," however sharp may be the explosive used.

The author has made many experiments with various explosives, in order to test thoroughly the fitness of this steel for gun barrels, and the results prove that there is no material which will excel it, and as the illustration shows, when tested to a bursting strain, the break which follows the bulging of the barrel is similar in character to the failure of Damascus under like circumstances.

The bulges were caused by placing a small charge of shot between two felt wads (first a thick felt, then the shot, then the thin felt) at the spot where the bulges are, and firing an ordinary charge from the gun.

The burst was effected by increasing the charge of shot between the wads; the bulges appeared about fifteen inches from the breech end after firing.

As many as five thick wads may be placed in any part of the barrel, and the gun fired without causing a bulge, but experiments prove that even the small quantity of ⅛ ounce of shot placed between wads at any place in the barrel will cause a bulge even as near as nine inches from the breech. The different sizes of the bulges in the illustration were caused by different charges of shot. The shape of the burst indicates the extent of bulging before bursting. The illustration is reduced to half size.

In choosing steel for gun barrels, many things have to be considered. The author attaches much more importance to the iron from which the steel is made than the amount of carbon contained in it. His wrought steel is made from the very toughest iron that can be procured, and as much carbon is used as can be allowed to admit of the drilling and boring of the barrel, so that the barrel is both hard and tough. These wrought steel barrels will stand being heated for brazing, without deterioration. Messrs. Krupp have introduced a steel for gun barrels which has many excellent qualities, but they must not be brazed, but held together by soft soldering only, which altogether excludes them from use by English gun-makers, as the hammering, chipping, etc., of English breech actions require that a stronger and more tenacious hold be made than any soldering affords.

Other Metals Used in Gun Manufacture.

The furniture of the gun was formerly made of swaff iron—that is, chippings, filings, borings, etc., of the iron barrels and other parts, collected, rewelded and forged. The material now most used is either puddled iron, ingot iron, or mild steel, containing 0.15 of carbon. The ingot iron is preferred as being clearer than puddled iron. Mild steel, when case-hardened, is quite suitable for breech action bodies. The bolts are usually of cast steel.

Stampings, or drop forgings, made by knocking the metal when red hot into dies, have now superseded hand-forged parts, save for one or two minor pieces, as the trigger guard. For hand-forging "best best" puddled iron is used, the forging performed in much the same manner as in the ordinary blacksmith's shop.

PUBLISHERS' DEPARTMENT.

The Pine Woods of the South.

THE NEW ENGLANDERS AND MIDDLE STATES' MEN AND WOMEN GOING SOUTH.

A GREAT many of the Northern people who go South to the pine woods at Southern Pines and Pinebluff imagine before they go that the pines are as thick as the pine woods of Maine. The fact is that there is hardly twenty pine trees to the acre in the Sand Hills of North Carolina, where so many people go for their health. At first sight the visitor is very much disappointed not to find more pines, but he or she soon realizes that the great healthfulness of the section is on account of the fact that at some time during the day the sun gets to every grain of sand and every blade of grass and dries it so there is no moisture to cause mildew and rot, or make food for the germ life to live on, and on account of the sunshine and pure white sand the water is as pure as the purest. The Southern pine tree is unlike the pines North, as it has but little foliage. A few scraggy, unsightly limbs at the very top, sometimes eighty feet from the ground, but the pine leaves or needles are beautiful and the constant lullaby song that the wind makes as it passes through the pine leaves is so soothing to the tired nerves of the invalids that they are soon nodding in the sunshine as they sit under the unsightly but health-giving trees of the South. If you want to learn anything about the pine woods and how to reach them by the best rail or water route, write to Mr. John T. Patrick, Pinebluff, N. C.

Some Calendars.

The 1903 calendar, showing "animals that are hunted," published by the Beemis Omaha Bag Co., of Omaha, Neb., is rather a new departure in calendars. It shows the buffalo, mountain sheep, moose, antelope, caribou, black bear, white goat, grizzly bear, Virginia deer, polar bear, mule deer and the head of an elk, these representing the twelve months of the year, from January 1903. Printed either on paper or cloth, it will be mailed to any address by the Ad-Sales Co., of Omaha, Neb., on the terms specified in their advertisement.

Through the medium of their calendar for 1903, Messrs. E. I. du Pont de Nemours & Co., Wilmington, Del., for public distribution, present a field scene, a copy of a painting possessing rare excellence. Two dogs in the foreground, a setter and a pointer, stand one on a point, the other on a back, both in spirited pose. Close to them a father is giving his son a first lesson in shooting. The father, calm of poise, yet sympathetically encouraging, has one hand grasping the gun, the other resting gently on the youth's shoulder, coaching him for the shot. The boy, open-eyed, intensely eager and excited, holds the gun awkwardly, as all boys do in their first attempts at field shooting. It is realistic in every detail. The legend on the picture, namely, "Generations have used Dupont powder," gives to the whole a theme which extends far into the past.

The calendar for 1903 issued by the Savage Arms Co., is unusual for its beauty and its truth to nature. A long, slim hunter has shot a mule deer buck, which has run down the steep hillside through open pine timber and fallen over on a log. We do not know the artist who drew this picture, but whoever he is, he knows his subject. Copies of this calendar will be sent on receipt of 4 cents by the Savage Arms Co., Utica, N. Y.

It Pays to Advertise Gunning Records in "Forest and Stream."

BLACKSBURG, S. C., Nov. 27.—I always get good results from my advertisement in your paper. I got a nice party lately.
A. G. MINTZ.

OYSTER P. O., Va., Nov. 16.—Since advertising in your paper it has brought quite a many sportsmen to my place, and I feel it was money well spent, as my place is pretty well known among the sportsmen now.
E. B. COBB.

Also Sneak Boxes.

BARNEGAT, N. J., Dec. 2.—We are getting a great many inquiries for our sneakbox through the advertisement in FOREST AND STREAM, and have sold two of them, one in Pittsburg, and one in Northampton, Mass.
A. F. KIRKPATRICK & SONS.

At the thirty-third annual convention of Associated Master Car and Locomotive Painters, of United States and Canada, recently held in Boston, Chairman W. O. Quest, of Committee on Tests, reports as follows concerning Durable Metal Coating, manufactured by Edward Smith & Co., 45 Broadway, New York: "Where unbroken from loose under (rust) scale, this paint is still elastic enough to award it the claim of being "Durable." It also stood a severe acid test without injury. This proves that where the Durable Metal Coating is applied to steel frames of sky-scrapers, bridges, or metal work, it will preserve it for years against rust. Great care should be taken that all rust be eliminated before applying the Durable Metal Coating.

The Roberts Safety Water Tube Boiler Co., 41 Cortlandt street, New York, one of the first continuous advertisers in the FOREST AND STREAM, now inform us that they have nearly 1,600 of their boilers in use at the present time.

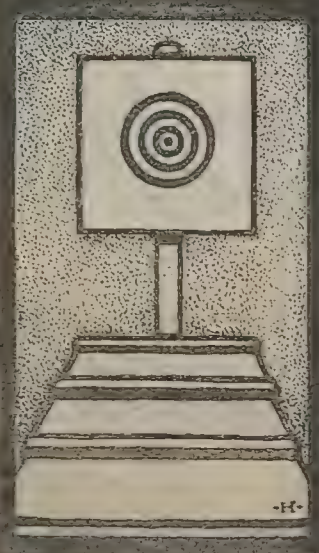
WINCHESTER CARTRIDGES SHOOT WHERE YOU HOLD



WINCHESTER

GREASELESS BULLET SMOKELESS POWDER CARTRIDGES.

THE severest kind of a test of the accuracy, cleanliness and general desirability of Winchester .22 Caliber Smokeless Powder cartridges loaded with Winchester Greaseless Bullets was made recently in San Antonio, Texas, by Adolph Toepperwein. Mr. Toepperwein, who held the World's Record for shooting flying targets with a rifle, having made a score of 979 hits out of 1,000 shots, undertook to better this record. He succeeded, making the remarkable score of 986 hits out of 1,000 shots, the targets being 2 1-2 inch clay discs thrown into the air by an assistant. Mr. Topperwein attributes his success in improving his previous record to the fact that the new Winchester Greaseless Bullet cartridges are so much cleaner than the lubricated bullet cartridges, which he used before. He says: "I am constantly using .22 caliber cartridges of Winchester make loaded with smokeless powder and the new Winchester Greaseless Bullet, and it is my belief that it is the best small caliber ammunition on the market. Its accuracy cannot be beat and I find the penetration equal to black powder loads and, if anything, greater, due probably to the hardness of the bullet. The ammunition works magnificently in any repeating rifle, and there is nothing to stick and gum the action. While shooting for the record last week, I shot in all 1,100 shots. During all this shooting, I did not clean the two rifles I used, nor did I find it necessary to cool them, although I shot quite rapidly. The barrels at the end of the 1,100 shots were as clean as though I had fired only 10 or 15 times. I am glad that you are pleased with my shooting, but it was only the result of using the best ammunition I assure you."

Yacht and Boat Sailing.

By DIXON KEMP, Associate Institute of Naval Architects. Price $12.

This edition has been largely re-written, and contains a great number of new subjects, and the lines of many boats never before published, the total number of plates, exceeding 100, besides more than 350 woodcuts in the text. Contents: "Selecting a Yacht," "Examination of the Yacht," "Building a Yacht," "Equipment of the Yacht," "Seamanship," "The Management of Open Boats," "The General Management of a Yacht," "The Rules of the Yacht Racing Association," "Yacht Racing; Handling a Yacht in a Match," "Centerboard Boats," "Centerboard Boats for Rowing and Sailing," "Sails for Centerboard Boats," "Small Centerboard Yachts," "Mersey Sailing Boats," "Clyde Sailing Boats," "Belfast Lough Boats," "Dublin Bay, Kingstown Boats," "Cork Harbor Boats," "Itchen Boats," "Falmouth Quay Punts," "Thames Bawley Boats," "Lake Windermere Yachts," "Yachts of the Norfolk Broads," "Small Yachts and Boats of Y. R. A. Rating," "Singlehanded Cruisers," "Types of Sailing Vessels," etc.

FOREST AND STREAM PUBLISHING CO.

CANOE CRUISING AND CAMPING.

By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.

This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.

Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

For the Sportsman's Wall

FOREST AND STREAM offers to sportsmen a number of beautiful pictures, suitable for framing and hanging on the wall of dining room or den. Of these, four appeal especially to the big-game hunter, and show four characteristic species of North American animals. They are artotype engravings by Bierstadt from original paintings by the celebrated animal painter, Carl Rungius.

Moose—Single figure. Plate 12 x 19 on plate paper 22 x 28.
Elk—Several figures Plate 12 x 19 on plate paper 22 x 28.
Antelope—Several figures. Plate 9 x 14 on plate paper 19 x 21.
Mule Deer—Two figures. Plate 12 x 19 on plate paper 22 x 28.

Two other artotype engravings by Bierstadt, from original paintings by Edmund Osthaus have a vivid interest for the upland shooters. These are

Close Quarters—Ripsey, the pointer, on point. Plate 12 x 19 on plate paper 22 x 28.
Quail Shooting in Mississippi—Plate 12 x 19 on plate paper 22 x 28.

The price of each of the above is $3.00, mailed safely in a pasteboard tube. Two will be sent for $5.00.

The duck shooter will be interested in a series of colored photographs which we now offer for the first time. These are

The Goose Shooter—Two photographs showing the gunner in his blind surrounded by decoys.
Making a Double—Shooting at a pair of mallards.
Waiting for the Evening Flight—Sitting in his blind as the sun falls low toward the west; distant birds beginning to move.
Canada Goose—Large figures of a goose standing on a bar.
No Rubber Boots—The gunner wading out in shoal water to recover his birds.
The Duck Hunters—The gunner in the bow of a gunning float being paddled by his companion up to ducks on the water.

Each of these prints is 6 x 8 inches in size, mounted on a card 11 x 14, and all are beautifully and naturally colored by hand. Price $2.00 each.

FOREST AND STREAM WATER COLORS.

Artistic and beautiful reproductions of original water colors, painted expressly for the purpose. The subjects are:

Jacksnipe Coming In. ***He's Got Them (Quail Shooting).***
Bass Fishing at Block Island. ***Vigilant and Valkyrie.***

Plates 14 x 19, printed in twelve colors, Price per set, $2.00.

346 Broadway, New York.

For Anglers and Big Game Hunters.

A Big Game and Fish Map of New Brunswick.

We have just had prepared by the official draftsman of New Brunswick a map of that province, giving the localities where big game—moose and caribou—are most abundant, and also the streams in which salmon are found and the rivers and lakes which abound in trout.

The resources of New Brunswick in the way of game and fish are only just beginning to be appreciated, and we are glad to offer to FOREST AND STREAM readers the first authentic information as to localities where sports may be had. The map is printed in colors, on a tough paper, and is enclosed in a stout manila envelope for protection in carrying. Price $1.

ALERT.

This spirited engraving of the noblest game animal of Eastern North America was drawn for the FOREST AND STREAM by Carl Rungius, and has been reproduced as an artotype by E. Bierstadt in the full size of the original drawing. The plate is 12½ x 19 inches, on paper 22 x 28 inches. It is the most faithful and effective picture of the moose we have ever seen and makes a magnificent adornment when framed for hanging on the wall. Price (mailed in a tube, postpaid), $3.00.

FOREST AND STREAM PUB. CO.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1902, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, DECEMBER 20, 1902.

VOL. LIX.—No. 25. No. 346 BROADWAY, NEW YORK.

Through the beneficence of Providence these magnificent mountains, having forty-six peaks and forty-one miles of ridges exceeding six thousand feet in height, and two hundred and eighty-eight other peaks and three hundred miles of ridges of over five thousand feet, "the greatest masses of mountains east of the Rockies," and "the highest mountains covered with hardwood in America," have been provided as an unfailing source for the rivers of six great States.

What a wonderful provision! First the bountiful, even wonderful rainfall; then these splendid forests to preserve and store it for the use of man! But the work of man is fast destroying the handiwork of God. Let us at once see to it that this shall stop, and that what was intended for the benefit of toiling millions shall not be perverted to their ruin.—Speech of Hon. William Elliott, of South Carolina in the House of Representatives, on the Appalachian Forest Reserve.

FOR CHRISTMAS WEEK READING.

THE next issue of the FOREST AND STREAM will be the Christmas Number, and will contribute its share to the enjoyment of Christmas week by providing a rich fund of entertaining reading.

Mrs. Llewella Pierce Churchill has written for this number a story of "The Rainy Chase of the Robber Crab," a bit of experience which has all the novelty and charm of her other Samoan sketches.

Francis Moonan will contribute a story of Rocky Mountain adventure, "The Wolf at the Door," in which the wolf plays a part quite different from that of the conventional creature whose presence at the door is expressive of the never ending struggle for bread.

"The Passing of the Sledge-Dog," by H. M. Robinson, describes the new conditions in the North under which the sledge dog, once the common transportation agency, has disappeared.

Alma will tell in "Stubble Rhymes" and picture a story of quail shooting in Michigan.

Yo will record the winning of a goat head by a novice amid the peaks and crags of the St. Mary's River country in the Rocky Mountains.

Charles L. Jordan will chronicle the extreme difficulties and some marvelous achievements of photographing the wild turkey in its native haunts.

Dr. Geo. McAleer will relate an amusing incident of simple and ingenuous backwoods life in Canada.

Coahoma will give some further notes drawn from his close study of rattlesnakes and squirrels.

The Old Angler will continue the "Reminiscences of an Octogenarian," papers which Charles Hallock in another column to-day characterizes as graphically imparting to the reader the realism of salmon fishing.

And to give further representation of the "Old Guard," Von W. will have a poem, "When the Long Shadows Fall," which, if it shall not be understood of the younger readers, will surely appeal to him who, looking back, reckons the tally of many a Christmas week long, long gone by.

PLACE NAMES.

ONE of the first things to be done when a new country is entered by man is to name its various geographical features. Hills and mountains, rivers and brooks, buttes and divides, springs and swamps, must receive names by which they shall be generally known, in order that the business of the new occupants of the territory may be carried on. As towns and villages spring up, and as roads are established, these, too, are named. Later, often much later, the surveyor and the topographer pass through the country, establish the location of its various natural features, and finally these features and others which depend on its occupancy by civilized man are transferred to maps and charts.

The note found elsewhere from the pen of our correspondent Juvenal calls attention to the unhappy methods used by Americans in naming places and natural features. It would seem as if some early surveyor in the Mohawk Valley, in New York State, had taken a classical dictionary and had at random named the various villages and towns after the best known names in classical history. Utica, Attica, Syracuse, Ithaca, Marathon and Rome are examples of the devotion to the classics of this early surveyor, who may be responsible also for such names as Marcellus, Cicero, Manlius and others. The French blood of long ago is seen in such names as Massillon, Marseilles and Vincennes, a little further to the West.

The early settlers of this country seem to have suffered from a sort of anæmia of the imagination, or, perhaps, it would be truer to say that they had no imagination to be anæmic.

West of the Missouri River we find names often given by people who were also without imagination, but who applied to the natural features of the country names that were either descriptive or historical. For creeks such names as beaver, elk, deer, muddy, willow and box elder, are scattered over the whole western country, duplicated, we dare not say how many times. But if they are commonplace and mean little, it seems better that a stream should be called Muddy Creek or White River, rather than Tiber River or Pactolus Creek.

In the matter of naming the streams along which they lived and which they had to cross, the Indians showed what will appear to many persons much better taste than has been displayed by the white man. Usually their names are historical and have a distinct meaning, the story of which still lives in the tribe. A certain stream in Montana, which we call Armell's Creek, is called by the Indians, "It Fell on Them," because once, when women were digging out from under its high bank the red earth which they used as paint, the bank caved in and the falling earth crushed a number of people. Another Montana stream, at which a bear, rushing out of the bushes, seized an Indian and tore him to pieces, the Blackfeet call "Where We Were Bitten." So there are Punished Woman's Fork, Crazy Woman's Fork, Antelope Pit River, Pawnee Buttes and the Hill of the Pile of Bones and many others, all of them based on events which are still remembered.

Such names have character and meaning, and where possible should be retained. They compare favorably with the names applied to some of the old towns in New York, or with some given recently—but which, happily, will not stand—to certain peaks in the Rocky Mountains, as Mt. Olympus, the Matterhorn!

In our cities, which so often are governed by bodies of men whose education is very slight, whose interests are largely confined to politics, and who are likewise destitute of imagination, we may expect to find names such as Edgecomb Boulevard, Pinehurst Avenue and Blythebourne Terrace. These things are past remedy. It is hopeless to attempt to raise the average city dweller above the level of his own commonplaceness.

Yet while, in place names in America, we have a vast number that are quite hopelessly bad from any point of view, we should be grateful for the large number that are not in that category, and which really represent something. Indian names are many, and all of them good; old Dutch or French or English names—those of the discoverers or early settlers of any region—may fittingly be used to perpetuate the memory of persons who came first into the country. But names that are high-sounding, yet without meaning, are an abomination, and should not be used.

The good old names that we have are yet in danger of being changed for others that are fanciful and meaningless, and many people who appear to believe themselves better than their forebears believe also that these old names are not good enough for them. It may have been a New York City Council which altered the name Tubby Hook to Inwood; and it was probably a village council which altered the name of the village of Schraalenburgh, descriptive and euphonious as it is, to the name of a living bank president!

The place names in old Canada, given chiefly by the French, are musical and pleasant sounding to the Anglo-Saxon ear—Rimouski, Trois Rivières, Trois Pistoles, St. Jean de Matha, Notre Dame des Anges, Temiscamingue. Many of them are of Indian origin, and of those which are French, the majority are the names of saints or are in some way descriptive.

THE account given elsewhere by Mr. E. A. Richard of the working of the new Newfoundland caribou law is very interesting. Whatever we may think of non-resident licenses, either between different countries or different States, it seems clear enough from Mr. Richard's statement that the increase of the Newfoundland license fee for the killing of bull caribou from $50 to $100, has had its effect in protecting the caribou. The extraordinary reduction in the number of American sportsmen visiting Newfoundland for caribou was due primarily to the exaction of a tax so high that it was regarded as an imposition. A fee of $100 is practically prohibitive, as the event has proved. Other influences, too, have operated to reduce the number of visitors. In sport, as in other things, fashions prevail. A dozen years ago very few Americans had ever been to Newfoundland for the purpose of hunting caribou, but half a dozen years ago it seemed as if every big-game hunter one met was asking questions about Newfoundland, how to get there, and what the prospects were when this land should be reached. For two or three years after that there was a great slaughter of caribou, and many men who believed themselves sportsmen, in pure wantonness shot down the beasts, as they attempted to cross the streams or later the railroad embankment. Against such methods there was before long a natural reaction, and American sportsmen of the better class were not slow in expressing their views on such butchery. It became apparent that to kill caribou in such a way required no skill, and was not sport, and men ceased to care for it.

The action of the authorities in setting aside an area of country fifteen miles long by ten miles wide, in which no caribou should be killed, was wise and far seeing, but this law has had a deterrent influence upon visiting sportsmen, for it requires the hunter to go further and work harder for his game.

Tourists in the Yellowstone National Park have been plagued by the nuisance of the clouds of dust, stifling and blinding, which have made travel on the Park roads a pilgrim's penance rather than a pleasure excursion. Government engineers in charge of the roads have put in operation a water sprinkling system which has accomplished so much in making the roads agreeable that it will be continued permanently. Not only has the comfort of tourists been promoted, but the roads have been subject to less deterioration than in other years. It has been proposed to apply to the Yellowstone Park roads the system of oil sprinkling, which has been such a notable success in California.

The time for discussing the expediency of setting apart the Southern Appalachian Forest Reserve has gone by. The wisdom and necessity of the step have been demonstrated. The country is convinced, and demands the park. Boards of trade, manufacturers' associations, town and city authorities, and State Legislatures have spoken for it. Nothing remains but for Congress to act. The action may well be prompt, because the measure is no longer debatable. It has been debated. Give us the reservation.

A novel movement in Colorado is the organization of a secret society for the protection of game. Game Commissioner Harris is at the head of it. The membership is to be made up of influential business men and other substantial citizens; each member will be expected to give to the commissioner information of any game law violation he may have knowledge of, and in every case the identity of the informer is to be kept a profound secret, even from his fellow members, thus to secure immunity from any revenge of prosecuted individuals.

Three carloads of elk from the October Mountain preserves of William C. Whitney, in the Berkshires, have been liberated in the Adirondacks. One lot was put out at the foot of Raquette Lake, and the other two were distributed near Long Lake, West Station. There must now be in the Adirondacks sufficient parent stock to insure a permanent elk supply if the newcomers can be shielded from the bullets of the thought-it-was-a-deer shooters.

The Sportsman Tourist.

An Indian Scare.

In the spring of 1867 our cavalry troop was sent on a scout from Camp Verde, Texas. We were to scout for a month in Edwards County, southwest of Verde, hunt deer and Indians, and look at the country.

We found plenty of deer, they and the wild cattle had this country all to themselves then. I never was able to find but one settler in the whole county, and he seemed to be here only because he would not be allowed to live anywhere else. As this was in Texas, it will be remembered, he must have been a hard citizen. The deer covered the country everywhere, and they were far easier to approach than were the wild cattle; in fact, we could not get within shooting distance of wild cattle at all, while we were on horseback, had we wanted them, but we did not; venison was good enough for us just then.

We saw no Indians, but found plenty of places where they had been less than a hundred years ago, and I have no doubt that these Indians saw us more than once, but if they did, they sent no one to tell us of it. We had marched west all one day without finding a drop of water since leaving camp early that morning, and I had about made up my mind from the appearance of the country ahead of us that we would either have to make a dry camp, or what was more likely, would have to counter march back to where we had come from and put in all night in doing it, when we came to a small lake or pond; it is called a water hole here. In the wet season this pond would be quite a quarter of a mile across either way, but just now all the water in it was right in the middle of it, it being a hole ten yards across that was fed by a spring on the bottom, most likely; the water was very good, anyhow.

The part of this pond that was dry now had a heavy crop of grass, a kind of a reed, rather, I would call it sedge grass. It grew so thick here that we had to cut and break it down to make a path to the water, then had to carry out water in camp kettles for our horses and mules. We camped on a hill nearly a quarter of a mile away from the water on account of the grass, the grass in this low bottom being too coarse and rank and not fit for horses.

The men carried up water for supper and breakfast before dark, but the cook had on hand a job of cooking venison, and shortly after dark concluded that he must have more water, and sent a man who had only been with us a short time, after it.

We had a number of these recruits with us, and the old hands had stuffed them with hair-raising stories of Indians. Nine out of every ten of these men who were giving the "rookies," as the recruits were called, this authentic information about hostile Indians, had never seen one themselves; we had only been on the frontier a few months then, and had not "met up" with many Indians yet. I had met my first ones when a boy 12 years ago, and had probably forgotten more about Indians then than these fellows were ever likely to know. But I listened to them stuffing the rookies and said nothing. I would get about all I needed of these recruits when sent to drill them.

Most of these new men had got so much Indian information now that they were able to see an Indian behind every bush after night; they were, most of them, from our large cities at the North, and this country out here after night was likely to frighten them.

The man had been gone after that water half an hour, when I heard a sentry that was on post at the foot of the hill call out his "Who comes there?" then repeat it; and in half a minute after doing so fire. A few moments after he had fired, this man, who had been sent after the water, came up the hill at what our officers designate when drilling us mounters, as a "S-l-o-w gallop." They were in the habit of drawing out the slow still slower to convince us probably that they did not mean a fast gallop.

This sentry, who had done the firing, happened also to be a recruit; it was lucky for the water carrier that he was; but an old hand would probably not have fired at all; he would have guessed who came there, the water carrier had passed out at this post.

I was acting quartermaster-sergeant here, our regular quartermaster-sergeant being at the post sick. I saw this man come rushing in minus the camp kettle; he had dropped it on the way, he had not been a soldier long but knew that when making a forced march to the rear the less baggage you carry the faster you can get there. Even an Indian knows that, and when we got after them they would always leave a string of old saddles, packs and buffalo robes to help us keep their trail.

"What is wrong now, Brown Second?"

We had three members of the Brown family in the troop, and a man here never heard his first name except when the muster roll was called. There were Brown First, Second and Third. I had Brown Second before me now. He was from Philadelphia, and had never been ten miles from it before.

"Indians! Corporal. Oh, that place is full of them! They almost got me."

"Indians be ——— Where did you leave that camp kettle?"

He had left it down there at the water.

"Do you suppose that we have so many camp kettles that we want to issue them to Indians? What did your Indians look like?"

He had not stopped to see; he was just going to dip up the water when he heard the most awful noise all over the country; I would have been scared myself if I had been there, and so he ran and left the camp kettle there.

"Why did you not stop and shoot a few Indians? Is not that what the Government pays us for? What do you suppose they gave you that pistol for?"

He could not see any to shoot.

Picking up my carbine I said:

"I'll go with you and shoot about all the Indians we meet; we won't meet over a dozen down there."

Had not he better get his carbine?

"No; you get the water; I'll attend to the Indians."

I knew that no Indians were likely to fool around that water hole while this troop was in sight of it up on this hill, and I thought I knew what had scared him.

When we were within a mile of this water to-day I had seen an animal put out across the prairie as though he was going somewhere and was in a great hurry to get there. I should have liked to follow him to see that he met with no mishap, but we were riding in column and I could not leave without permission; I would have been given it had I asked for it.

This fellow travels under the name of the Mexican lion down here; he is sometimes only the catamount; it depends a great deal on where the man, who is naming him comes from. I knew him as the wild cat. He is not half so dangerous as he thinks he is; I had a greyhound a few years after this that could kill him as fast as I could club him down out of a tree to where the dog could get him; he got me one out of the Concho River.

We started now, and as I passed our sentry, I told him not to be so extremely ready to fire after this; the moon was up now, and he could see who came there if we failed to tell him. I would answer him the moment he challenged though, the regulations told me to do so; and I was supposed to set an example; but a man half scared to death by "Indians" might not hear him, Brown did not.

We kept on down to the water without seeing any Indians. There were no trees down here, and I did not expect to find that cat here. He might have been in here after water, and if he had scared Brown he had no doubt been as fully scared himself, and had left long ago.

The camp kettle and tin cup lay here where Brown had left them; the Indians had not got them.

"You are lucky, Brown," I told him, "when you come to sign the next pay roll you won't find 'due to the United States one camp kettle.' You barely escaped having to pay for this one. Those Indians must be long on camp kettles, they did not want yours. It is the first time I ever met Indians who did not want the earth."

Brown took up his tin cup now to get the water, and the moment he struck the water with it we were saluted with a noise that cannot be better described than as being like the noise a boy makes by raking a stick quickly along a paling fence. The noise came out of the water. Brown got up and began to shake, but did not run away this time, and the noise stopped as soon as he took the cup out of the water.

Handing him my gun I took the cup and hit the water, and the racket began again.

"Keep a good lookout for those Indians, Brown, and I'll fill your kettle for you." I knew now what was making this noise. I filled the kettle while the noise continued, then, when I quit, it stopped.

"Now, do you know what made that noise?" I asked.

No, he did not.

"Frogs, Brown, just plain everyday frogs. That hole must be full of them. This water is still here and when you touch it they know it, and make that noise. We won't see any Indians to-night."

We started now, carrying the camp kettle between us, and after going on a while Brown asks, "Will you do me a favor, Corporal?"

"Yes, if I can. What is it?"

"Please don't say anything about this up in camp."

"I won't. If the men ask you about it tell them that the cat we saw to-day made that noise and that I could not get a shot at it down there, it was too dark."

Had this story got out in the troop Brown would have been favored about twenty times a day for a week, or until the joke had been worn threadbare, with more or less accurate imitations of a frog croaking.

Cabia Blanco.

Erie, Pa.

In the Shastas.

Shasta Mountains, Cal., November, 1902.—Deer have been notably scarce in my domain. I had climbed the steep brown sides of the mountains to various altitudes, clambered through the cañons and ravines, cooned it over rocky promontories, bushwhacked in the dense thickets, and tobogganed (?) upon the glassy pine needles of the slopes until my hunting boots were wrecked, my wearing apparel threadbare in its more conspicuous parts.

The summer had been an unusually dry one (which means much in the sierra of northern California), and the warm rocky slopes were sunbaked, hard, harsh and crumbling under foot. Moreover, the gophers, squirrels and other small miners seemed to have been exceptionally industrious in making the broken surface of *terra firma* rather *infirma*. Under such conditions the science of deer stalking is additionally complex and laborious. The few and scattered deer in the more accessible haunts, very high up the most broken ridges, were apparently content to keep themselves within narrow bounds, and the noisy nature of the dry leaves, undergrowth and crumbling ground made it nearly impossible to approach near enough to get a glimpse of them.

The open season had nearly come to a close, without a drop of rain, and in the last days of October the weather had not changed conditions so as to amend them to any appreciable extent. When the first rains began to fall they proved so warm and moderate they had no evident effect upon the movements of game.

I made a dozen or more excursions with my amiable dog, Shep, and my meat gun, with the result of but a glimpse of two or three allowable deer. Shep considered larger game out of the question and devoted himself to small matters. We picked up a number of squirrels, two foxes and a large lynx, in our trips with the rifle, without my getting a shot or Shep getting a ki-yi-yi-yow at a deer. Then we ignored the sublime and fell to sniping an occasional mountain quail from near thickets with a shotgun.

Finally a heavy, soaking rain, lasting for over a week came, clearing the atmosphere by putting out forest fires, freshened vegetation, and particularly benefitting things by soaking and softening the soil and forest litter of the mountains. Then we made two or three other efforts to find deer, with no satisfaction other than to find a bed or two, high up on the ridges, which showed that the deer were not shifting. A kind of shrub-oak, which is little more than a bush, growing in the higher altitudes in this region, were well loaded with acorns, but the deer were not feeding upon them. Both my dog Shep and I had about concluded that most of the deer had been exterminated or had migrated to parts unfamiliar and remote.

A Buck is Nominated.

The long-continued rain was yet rattling upon the roof, dripping from the pines, firs, black-oaks, maples and dogwoods, and all the underbrush was bending under the weight of water held in the cups of the foliage. Bowlder Creek was a roaring torrent and the ravines tributary were humming low or loudly according to the area of the territory they drained. About ten o'clock the rain clouds broke away somewhat, and instead of a constant downpour, the rain fell at intervals in heavy showers. In this particular region the sky is notably frivolous—when it rains. It can clear and cloud, quit and resume, shine and shower more times within a few hours, or rain longer and steadier and bigger drops than it doth anywhere from whence I have intelligence, either by private correspondence, leased wire or associated press dispatches.

And so, about ten o'clock, when the clouds scattered somewhat, in a sort of a bogus way, Shep and I went around a ridge to the north. We found the trees and bushes dripping with water, and we were both soon wet about the legs. Then, at the time when we were in the midst of some of the steepest and most difficult ground, and in the thickest brush, the weather resumed active precipitation, so we made tracks for the house, where we arrived with as much moisture in our immediate possession as we could have collected by special endeavor. When we had safely reached shelter, the rain ceased abruptly, and the sky became jarringly blue and distressingly serene.

And, dripping profusely, with an apologetic kind of an advance, I approached the kitchen stove, drew up a chair, and proceeded to explain to my wife that deer hunting is sometimes difficult and damp. It occurs to me at this juncture, that, in writing my adventures, I have not heretofore advised you that I am married. This is, however, a fact—a fact so well known to me that I have, perhaps, presumed in thinking it a matter of general import and intelligence. It is another story.

As I was saying, I was explaining, preparatory to obtaining some dry clothes, when Shep barked outside and from the window Jim could be seen coming in from the woods. He had his rifle, and I noted with some regret that he was not as wet as I was. Somehow he had found some sort of a shelter—probably in some hollow tree.

"Well," said I, "have you been out in it, too?"

"Yes," he said.

"See anything?"

"Saw a buck," said he, "up above the thimbleberry patch between the forks of Bowlder." After a pause he added: "Had a fair shot at him at fifty yards, and tracked him a couple of hundred yards. Lost him."

"No use hunting with that gun," said I, "it was worn out twenty years ago. Couldn't hit your hat with it, and hold your hat yourself; it——"

"Well," said Jim, "he was a four or five pointer, standing under a tree eating acorns. Shot at his neck. If I had shot at his face I would have got him. He was fat. Followed him to a rocky point. He was gone, but I couldn't find his tracks out of there."

"Ought to be able to track a big deer on a muddy hill. Ought to have a dog. Might borrow a gun that- ——"

"Ground too rocky," said Jim; "too much brush—steep hill. I can kill quail with this gun—killed one the other day, shot its head off. I hit the deer in the neck."

"Well," I observed, "he ran away. Did you knock him down?"

"No. He didn't fall. Ran off a hundred yards, seemed dizzy and stopped a moment behind a tree from me."

"Run up hill, or down?"

"Kept around the hill toward the creek. When he got to the rocky point he was out of sight and I lost track. He went up hill part of the way—kept a sort of a trail."

"Never touched him. He wouldn't got up hill. He wouldn't follow any trail if he was hurt. Did you find any blood?"

"There was a little where he was standing when I shot. Couldn't find any more. Must have hit him in the neck too far back."

"Do you want to go back with the dog?"

"Well," said Jim, "I never got a deer yet by going back. Don't think Shep would track him. If I had had Jack I would have got him."

I thought it over a minute. We were both wet—we wouldn't get much wetter, though it was evidently going to shower. It was one o'clock. It is at least two miles all up-hill and steep. Brush was very wet. It had rained on the track hard and would rain more. Could Shep follow the scent? Possibly we might get a shot at other deer—it was a good place for 'em.

The latter consideration turned the scale, thereby provoking this story.

"If you want to go back we will take Shep and try it. Think it any use?"

"It's wet," said Jim. "Never got a deer yet going back after it. We might get a shot at another."

"All right. We will eat a lunch and go. No time to lose. It's going to rain though."

Whether she thought it useless or immaterial, my wife offered no protest, and, after a hurried lunch, Jim and I set out; Shep was promptly on hand and he had evidently summed the situation up to his own satisfaction. He led off in advance, glancing back now and then to see that he was guessing our course properly. If he had been told in language clear to his comprehension just where we were headed for he could not have taken a more direct course, or have assumed a more confident

and assured expression of countenance and demeanor. Dogs understand some things intuitively—whatever that is to say. Shep, however, had no premonition that he was on the way to the most formidable adventure of his active life, and that he would not frisk about as gaily two hours later.

While we were in the house the rain had ceased and the sky was fairly blue to the west, the direction we took. For about a mile on our way we followed a ridge, known to us as the "long ridge." It is timbered chiefly with tall pines with some black oaks. About half way up the ridge we had made our way when the rain resumed, and it came in torrents. We hugged the trunks of some pines during the heaviest of the showers, mainly to keep water from coursing down our backs, but with no hope of keeping dry. Nearly two hours elapsed before we reached the thimbleberry patch, and during most of this time rain had fallen heavily. We had concluded that it would be impossible for the dog to track.

Reaching upper Bowlder Creek, and crossing the torrent upon the huge granite bowlders strewn in its channel by prehistoric avalanches, we climbed the most abrupt and broken of a series of ridges that are spurs from an unnamed peak, one of the highest and most pointed of the region. After a sharp clamber through dripping brush and over huge broken ledges of granite we came to a small terrace, broken with a number of short steep ravines. Here a group of live-oak trees was pointed out by Jim, under one of which the buck had been standing when he shot.

There Was a Drop of Blood.

When we reached the bench or terrace, a few paces from the group of trees, and paused for breath, we found ourselves standing by a "bed" made by a deer. It was fresh, that is to say, it had been made during the day. The rain had not washed out the animal's tracks, and they were those of a big buck. The bed was simply the leaves and grass pawed away for a space a yard in diameter, and it was out in the open upon the exposed projection of the ridge.

"Didn't see that before," said Jim; "he must have had his bed here last night. He was eating acorns under that tree over there when I saw him."

The tree was on the steep slope and under its shelter the deep tracks of the buck, where he had jumped at the crack of the rifle, were yet plainly seen. Upon a loose fragment of granite, by close inspection, we found a single drop of blood—so nearly washed away by the rain that it could barely be distinguished to a certainty. I called Shep's attention to the rock, and much to my surprise he promptly took the track, with his most confident air. He has not been trained to slow-track, and consequently he set off at a smart pace, tracing the course of the deer around the side of the mountain almost upon a level. As Jim and I followed, quickly as we could over the sidling and slippery ground, we could see that the buck had taken short jumps for an animal of his size, but there seemed to be no irregularity about them, as would be the case with an animal much hurt.

We followed the course Shep had taken, over two or three spurs of the mountain, covering a distance of about three hundred yards. Jim had been over this ground the third time in the morning, and each time had lost the track at this spur which was completely covered with fragments of rock, pitching off abruptly into a dense thicket that reached down over steep broken ledges to the stream that thundered in its chaotic gorge below. When this rocky spur was reached Shep, too, was bewildered. At first he went up the mountain for a short distance, hestitated and retraced his tracks a number of times, then came back and entered the thicket, going down into the gorge.

"If he went down there I think he is hurt," said I, "and Shep will jump him."

"Don't know," replied Jim, "I was around through there as far as I could get this morning. Could find no tracks or signs."

We could see the dog now and then, as he hunted the thicket faithfully down to the steep precipices overhanging the torrent. Finally he worked his way back to us, well winded. In his old age he is inclined to corpulency, and his coat is thick and heavy for a hot corner. He came to us plainly puzzled. There was a little brushy hollow the dog had apparently avoided and I clambered down to it and had him search it well. He again came back, intimating clearly by his actions that it was no use. After searching about as best we could for an hour we could but conclude that if the deer had taken that course he had found his way into or across the gorge, and if so the rain and stream had obliterated all signs.

"Were you far into the thicket this morning, and which way did you go?" I asked him.

"Made two trips into it and back again, from here," he said.

"It is possible," I replied, "that Shep has followed your tracks to see what you went down there for. At first he went up the mountain. I believe the deer did not come down here, but kept around or up the hill."

"No use," said Jim, "I looked over the ground up there several times. If he went that way I could have found his tracks. Never got a deer yet by going back for it. If I had had Jack——"

"I'll go up there and start Shep again," said I.

Jumped, and a Hot Corner.

Both Jim and myself were somewhat weary in our wet clothing, from our trips in the earlier part of the day, and the long climb up to our present situation. We went up the point or spur of the mountain to the spot where the track had been last seen. Here I put Shep at work again and he had gone but a few rods, around and up the mountain side, when I saw that he was interested in this new move. After sniffing in different directions and trotting here and there, suddenly, without further pause, he started a fast walk, then a quick trot and then broke into a run, following a consistent and direct course diagonally up the mountain. I watched him as he clambered up a second spur that was almost perpendicular for a few rods. Meantime I called Jim's attention to the tracks of the buck where his sharp toes marked the ground.

"That's his track sure," said Jim. "Strange I couldn't see it this morning."

"Shep is on the track," I replied, "but, if the deer has gone up that way, we are not likely to see him this year."

I had scarcely spoken when we heard Shep's cry, apparently half a mile away, and up the mountain. Now it stopped, was then heard faintly as if in crossing a ravine, then it would sound like a baffled bay. It sounded then as though the dog was in a ravine through which he was scarcely making progress. The spur of the mountain we had left about a hundred yards to the north of us, could be seen from our present position to be one of the main ridges, keeping its form and slope almost to the summit of the peak. As we listened the sharp cries of Shep seemed to come from the upper end of this spur. An instant more and they came into view. Head on, the buck came bounding down that steep spur of the mountain with the dog in close pursuit. We were at the time in a cluster of pines, I being several rods in advance of Jim. We both turned back to get clear of the grove in order to get a shot at the magnificent flying target. In this maneuver Jim was in the advance, but could not clear the grove of trees in time to get an unobstructed view. I could not begin to get into open ground in time. Jim fired three shots without effect.

Meantime the intermittent view of the chase that I had was one of the most magnificent things I have seen in the mountains. The sun had broken through the clouds and mist sufficiently to throw a wonderful light upon a sublime prospect. The long ridge from the mountain top to the cañon below stood up sharply against its background, a golden-brown wedge, standing edge up against the blue-black forest beyond. Dropping from the real clouds that crowned the summit of the mountain the magnificent buck sprang with mighty bounds down the very edge of the narrow golden slope.

Apparently in full vigor and prime, one of the fleetest of the larger animals, with head erect, antlers thrown back, tail spread like a fan and showing like a white and black plume, he came, with increasing momentum and speed sheer along and down the narrow line of the steep decline.

Shep had gained the ridge perhaps a hundred yards behind the deer. The quarry in full view, the whole nature of the dog was frenzied. The ground was now perhaps more favorable to the dog than to the deer. The greater weight of the latter made him necessarily more guarded against the tremendous momentum, that seemed sufficient, at each time he sprang forward to hurl him into space. The black form of the dog seemed rather to shoot like a rocket along the crest of the ridge than to depend upon any visible means of motion. In the run down the slope of perhaps a quarter of a mile the dog shortened the space between himself and the buck from about one hundred yards until he seemed to reach the heels of the deer.

The ridge terminated in the gorge before mentioned, but it became rocky and broken some distance above its abrupt extremity. As the deer reached the first cliff of rocks, without the least slackening of his speed, over it he went, with a mighty bound and final dip of his white flag. Shep was, at the time of their disappearance, so close to the deer that they seemed both to rise and go over the ledge at the same instant.

The three shots fired by Jim in rapid succession made no change in the race, though it is possible that one shot of the three passed through the animal. One cut a half circle from the buck's ear.

As dog and deer disappeared we hastened as rapidly as possible to the ledge, pausing repeatedly but hearing no sound. When we reached the rocks we found the ledge to be less abrupt than I feared, and both deer and dog had evidently cleared it and reached a chaotic mass of rocks and jungle below. We had gone but a few steps when Jim sprang to one side to see around some brush and fired two shots, saying, "Here he is." His shots were ineffective, being fired at the buck's head at fifty yards. The deer had meantime moved, so that I saw him clearly from my position. At the third shot he went down, shot through the heart, as I thought.

We rushed down over the rocks and brush as best we could, and as we did so I heard the dog utter a sharp cry ending with a stifled whine. Believing the deer down, if not dead, I asked Jim, who was near the spot where the buck had fallen, if Shep had him. He looked over the mass of brush, fallen tree tops and rocks and said, excitedly, "The deer has got Shep!"

I rushed to his side as he raised his rifle to fire. We stood within ten feet of the deer. He had regained his feet and now stood with head down and feet braced. Between a tangle of thorns and a log, with the deer's antler's bearing upon him with all its power, there was a silent and motionless rolled up bundle of black hair that was probably poor Shep.

At the instant came the crack of Jim's rifle—the buck dropped, rolled over on his side, the bundle of black hair straightened out—coming head-first from the tangle. It was Shep, with his teeth fastened in the buck's nose. The last shot struck the deer in the ear, killing him instantly. As the deer dropped limp and motionless, Shep unfastened his teeth and staggered to his feet in a dazed way, and it was some moments before he was assured enough to wag his tail. But Shep is game. He recovered his mind before he could keep his feet, and tried his best to rejoice.

As far as could be seen at the time the dog had no serious cuts in his skin, but it appeared that some bones must be broken, and he was perhaps greatly injured internally. He was broken down so that his hind legs were partly paralyzed, and he could not keep his feet. We made him as easy as possible by raking some leaves together for him to lie upon, and as it was then after four o'clock we proceeded to hang up and care for the buck.

He proved to be a five-pointer and in prime condition. He weighed approximately 200 pounds, and owing to the nature of the ground it was no easy task for us to get him fifty feet up the hill to a small pine where we hung him, after removing head and horns. He was a comparatively short-legged animal, with a notably thick-set, heavy body, his horns being of a reddish brown color, instead of the more ordinary light stone or gray color.

These short-legged, heavy-bodied deer with red horns are frequently killed in this region, and experienced hunters readily note their distinguished differences to the commoner California and Pacific deer. In my opinion they are a cross between the mule-tail and the latter.

In skinning the buck we found that Jim, as he said, had hit him in the neck. The bullet had struck to one side of the vertebræ and ranged into the muscles at the shoulder. The shot after the lapse of two or three hours had perhaps stiffened the animal about the neck and shoulders, just sufficient to enable the dog to stop him after the hard run had brought him to the broken walls and tangle of brush in the gorge. The buck had received two bullets while at bay, one through his body a little back of the brisket and one breaking his shoulder. The finishing shot passed through the base of the brain.

The rain had ceased for a time, and a sharp wind from the west made it cold work dressing the animal. Being wet we were quite chilled before we had it done. It would have been impossible to get to the spot with a horse, so we decided to partially skin the animal and carry one-half of it. A good way to do this is to skin the deer from the head back to the last or short rib, leaving the skin on the remainder and cutting out the fore quarters. This makes it much nicer to handle and protects the best parts of the meat while being carried to camp.

By the time we were ready to start for home we found that Shep could keep his feet after a feeble fashion, and with encouragement he could follow slowly—going upon about two legs and a half. Upon closer examination I found no evidence of broken bones, but he was much bruised in the groin and there was an ugly place torn in his side just forward of his flank. Jim took the half of the deer (75 or 80 pounds) upon his shoulders, while with the two guns, the deer's head, and the crippled dog to look after, I thought I had all I cared to undertake.

Poor Shep was not yet out of the woods nor at the end of his troubles for the day. Painfully and slowly, but always with assuring wags of his bushy tail, he followed as best he could until we reached the creek that we must cross. It was booming down its gorge, swollen with the rains and roaring with energy and power. Where we crossed there was a succession of falls—where the water plunged from a yard or two to twenty feet sheer over logs and bowlders. We selected a place where there was a fallen tree reaching across the stream, but the log was covered with vines and briers. Jim and I crossed upon the log, and by a jump of a yard or more, to the bank. I was putting my load of guns, and the antlers, down, to go to the dog's assistance, when I saw that he had avoided the log and was trying to cross upon the bowlders. He had made his way to the middle of the stream, and was now hesitating upon a round bowlder upon which he could, in his crippled condition, scarcely keep a footing. From where he was to the next bowlder he must jump at least six feet. This, with his hind legs almost useless, I knew he could not accomplish. I hurried toward him, and tried to stop him, but in the roar of the water he could not hear my voice. He tried the jump, his legs failed him and into the boiling, ice-cold rapids he went. For a distance of a dozen yards he was chiefly under the water and unmercifully hurled along. I ran for a little eddy, or rather a whirl-hole between some of the huge bowlders, just below which the stream plunged fully twenty feet over a granite wall—sheer down to bowlders below. Shep struggled bravely as he swept into the eddy, and by the merest chance I succeeded in catching one of his paws. I pulled him upon the slippery bowlder upon which I sprawled. He was a very wet, cold and forlorn dog. But he was game yet.

With the ice-water streaming from his shaggy coat, in his crippled and sore condition being powerless to shake himself, Shep could still wag his tail as an assurance that he would make it yet. Make it home he did, and at this time he is almost recovered, ready for another chance at anything on four legs.

I think this sketch is long enough. It is the accurate account of the killing of a deer, with attendant incidents. Just where the sport comes in the fellows who have not hunted deer can scarcely determine, perhaps, and I cannot explain clearly myself. But an old hunter will spend many an hour in after years dreaming over just such adventures. This I know, for I can recall many such, and with more accuracy of detail, more pleasant reflection, and with probably an easier conscience than a man is wont to reflect upon things of greater moment with which he has been connected in the world.

RANSACKER.

P. S.—In the past week I have been busied at odd times in preserving the trophies of the hunt. I usually preserve the horns with a portion of the skull attached and the shield of skin over the forehead. I preserve the skins by tanning them with the hair on. A large deerskin, taken from an animal killed in October or November, and properly tanned, makes a very attractive rug or floor mat. The hair is coarse, and in color of a quiet effect, but it is peculiarly rich and heavy, and grows more and more pleasing to the eye almost anywhere it may be placed.

R.

A West Virginia Bear.

MORGANTOWN, W. Va., Dec. 9.—*Editor Forest and Stream:* For the past five years a large bear has made its home in the Beaver Dam country in Pocahontas county, this State, and has subsisted principally on sheep. The whole population has been banded together to kill it, but it seemed to be proof against all traps, poison and bullets, and is estimated to have killed one thousand dollars' worth of sheep.

Last Tuesday night it killed a sheep for Dan Munday and on Wednesday a hunt was organized. The bear was jumped on Day's Run, and came by one of the party who shot it through the fore leg, crippling it badly; it was able, however, to get away for the night. On Thursday a pack of hounds and bear dogs was made up and the hunt continued; the bear was found on Spruce Knob and the dogs put it across William's River and stopped it near the top of Black Mountain. Dan Munday came up with the game and put a bullet through it killing it.

It weighed, when dressed, four hundred and fifty pounds, and had an exceptionally fine pelt, for which they refused thirty dollars. There is much rejoicing at its being killed.

EMERSON CARNEY.

A Story of Amos Cummings.

The relations of Amos J. Cummings and Lawrence S. Kane were those of Damon and Pythias. Were both alive now, one, the late Congressman, would not deny that he preferred to gratify his ruling passion for practical joking on "Larry," in spite of his strong liking for him, to "rigging" any other of his acquaintances, and "Larry" would admit that he submitted to Amos's fun without rancor. They used to fish for black bass at Henderson Harbor on Lake Ontario. Larry was one of those nervous sportsmen who are always on edge and ready to bag anything. On his fishing trips he was never without his gun and ammunition.

Larry at 4 'o'clock one summer morning was roused by Amos with the information:

"Ducks, wild ducks."

"Where?" asked Larry, vaulting out of bed and rubbing his eyes.

"Down the cove. Ten of 'em. Now, quick and careful."

In a minute Larry, gun in hand and dressed in anything he could snatch up was on the porch of the hotel cramming cartridges in his pocket. While he loaded his gun—he crammed in buckshot cartridges by mistake—Amos planned the campaign against the wild fowl.

"They're as wary as hawks," he said, "and the only way to get within gunshot, Larry, is to stalk 'em."

"Stalk 'em?"

"Yes. Over the knoll, just as if they were deer. You mustn't raise your head, but go along on all fours. 'Tisn't far. Only about a quarter of a mile. Then you come to some brush not seventy-five yards from where they are, and can give it to them. You crawl ahead and I'll follow."

Trembling with excitement Larry began the "stalk" over rough ground, covered with briers and chunks of rock. Had he looked around he would have seen Amos walking erect and rolling with merriment. At the brow of the knoll he was halted with a "Sh-h-h-h" from Amos, who crawled up beside him.

"See 'em?" Amos asked in a whisper, pointing to a little bay in the cove.

Larry strained his eyes and saw a number of floating objects bobbing on the water, and his excitement increased.

"Go on stalking 'em," was Amos's caution, "to those bushes. Then bag 'em. Fire at the bunch. I'll stay here."

Larry, perspiring and breathless, continued wriggling like a snake over the broken ground and managed to reach the place indicated. He leveled his gun three times as he lay prone before he could aim, and then pulled both barrels. The recoil knocked him around so that he could see Amos—running and yelling with laughter toward the hotel.

"I kept shy of Larry," said Amos, relating the story, "until dinner time, when he sat down at the table rather sheepishly, shook hands and attacked the grub without saying a word. I felt a bit contrite, but I would again get a wetting as I did in putting out those decoy ducks to see Larry crawling over that knoll and the expression of his face when, waist deep in water, he discovered the facts. The only sign of anger from him was after dinner when I snickered at his remark:

"'Well, anyway, that Parker of mine made a good pattern on the decoys.'" T.

Advanced Ideas in Farming, Trapping and Woodcraft.—III.

Then a strange thing happened. You may, perhaps, have observed during your perusal of the modern novel—the twentieth century novel of average construction, dealing in yellow mystery, inch-deep plot, beer froth and unsanitary exhalations, that when the story has reached a point of unusual stupidity and utter rot, that the author apparently awakens to the startling truth that if he is to get any further along, he must interject something with an exclamation point following it. He invariably says: "Then a strange thing happened!"

The reader, aroused by this jolt, and impelled by curiosity to ascertain if there was anything stranger than that the writer had found a publisher, now pulls himself together, rubs his eyes, steps on the cat's tail, and partially awake, reads on under a misapprehension. But he commonly finds that the author has been trying to keep him awake under false pretenses, that really nothing does happen, and he again peacefully falls asleep to dream of croquet, and young people sitting on the beach, with a big policeman hiding behind a tree. But in my case it is wholly different. I make use of the phrase advisedly and with malice prepense, as it were, and you will agree with me later on that I know what I am talking about. I repeat, A strange thing happened. The 11:45 P. M. through fast freight had passed the rear end of our farm without stopping at the last station, apparently having an important business engagement further on down the line. At this point there is a considerable grade, at the foot of which there is a sharp curve; just why the chaps that surveyed the line for this road put that curve just where they did has puzzled more than one cracker barrel scientist.

Uncle Ephraim, however, had a theory that it was because the railroad company regarded the price asked for the right of way through the sheep pasture on the rear end of the farm as too high, and sought a less expensive route for the distance of a mile. Of course, the land embraced in the sheep pasture was no doubt the worst on the farm, beside, uncle didn't keep any sheep, anyway. Ordinarily, the piece in question would be dear at $12 per acre for any purpose except for railroad tracks, but uncle was one of your thrifty New England farmers raised out among the stone heaps of Vermont, and he estimated that for railroad purposes the strip, equal to about four acres, was worth to the railroad about $5,000, but seeing it was for the public good, and all that, he would take $2,500, and an annual pass over the line. This offer was declined with thanks by the railroad officials, and failing to remove uncle's impressions regarding comparative real estate values, the road took a scoot around that corner of the farm, and uncle still remains sole owner thereof.

The fast freight was coming down the grade at about a forty-five-mile-per-hour gait, and when it struck the bend at the foot beyond the row of maples, on that dark midnight, the engineer saw before him, about eighty yards away, the headlight of another locomotive; he could see a long train moving as fast as his own. He was undoubtedly impressed with the force of a now generally admitted fact that it is highly imprudent if not positively risky, for two trains moving in opposite directions upon the same track to attempt to pass each other. The thing has been tried time and time again, and probably fools and cranks will keep on trying just the same as they do on perpetual motion. But the inevitable result is dismal failure and an awful mussing up of the right of way. The train crews, of course, jumped, some into a concenient ditch, others into adjacent piles of ties and railroad iron. That was another strange thing—why the men preferred to land on piles of iron rails and cedar ties when they could just as well alight gently in the mud. There's no accounting for tastes, as the old lady said. I remember a cussed little gray pony that uncle once bought of an Indian and put him on the farm to haul the two boys and me to school. That pony seemed to have less sense and judgment than anything living. He would stand in the broiling sun all day with a thousand flies making life miserable, and never flick a fly, with a nice, shady grove within fifty feet of him. He would eat mullen leaves and burdock, when a clover pasture was wide open to him. He was certainly the biggest fool in Kansas, and that is saying a good deal.

The train which the fast freight met with so much suddenness and informality happened to be the first section of a circus train. It contained the menagerie and performing monkeys, also the usual assortment of "gentlemanly assistants who will now pass around the ruby lemonade, etc." It might be mentioned in passing that there was no lemonade passed at that performance. If you had been in close proximity to the point where those two trains met, I think you would have said that I am amply justified in using the expression with which this chronicle opens. When the animals realized what had occurred and that there would be no duties demanded of them the following day, they just simply tore things wide open, and every single specimen that had any claims to a voice at all vied with every other specimen in filling the surrounding space with noise, and the space was soon crowded with it. At first the people in the surrounding country thought it was our big Shanghai rooster, but remembering that I had sold it, they came rushing over, pell mell, falling over the African lions and butting into the big and little elephants, trying to get away from the polar bears and avoid the snakes and walruses. That "aggregation of attractions" never gave such an exhibition before or since. Everything was *al fresco* and *au naturel*, free, gratis, for nothing, and every man for himself. It also looked as though not only the devil would take the hindmost, but that the royal Bengal tiger would be an active competitor for this honor. The giraffe was the only creature, biped or quadruped, that appeared to take an excited view of the situation, and he proved to have had a leg broken. Well, it was a bad mess, and the tumult lasted until noon the next day, when the managers and bosses and animal trainers took account of stock of things.

I saw my opportunity. It is truly an obstinate and unruly tornado in Kansas that blows no good to anybody whatever. I saw my chance to go into the adapting business mentioned as one of my fond ambitions. I hung around the treasures and found that the show was financially embarrassed, anyway, and this calamity was the last strand. I began to throw out feelers for bargains in animals, and in less than an hour I had a broken-legged giraffe, two white sacred cows (with some of the paint rubbed off, but practically as good as new), one damaged zebra, one cage of brown melopotismians (unclassed), three horned owls, four ostriches (much the worse for the loss of their feathers and three eyes), two camels (affected with catarrh and ingrowing nails), one yellow horse with a false tail and a glass eye (which he had lost in the accident), then together with an assorted lot of battered monkeys gave me an elegant collection, all for three hundred and forty-four dollars. The wild man of Borneo struck me for a position as care taker at $20 per month, but when he said he was raised in Canada and talked Irish, I turned him down cold.

As my chronicle concerns the farm and its affairs, the development of nature's forces and especially the principle of adaptation, as previously announced, I will not longer follow the fortunes of the wrecked circus, nor the incidents and future of its victims. I think I have my hands full at home, to say nothing of the barns, the barnyard and the fullness thereof. It didn't take me over two hours to realize that I had made an awful mistake in acquiring that yellow horse and the cage of monkeys. But the giraffe commended himself to me at once by an accidental occurrence; he reached up to the topmost limit of an apple tree and helped himself to the finest pippin on the tree. Then came an inspiration. This, I think, was inspiration No. 2. I would train this beautiful and tractable animal to pick my apples. I set the broken leg, fixed up a comfortable place for him, and in three weks he was as good as new; and in another three weeks I had that chap trained so that I could strap a couple of bushel baskets to his back, and he would march through that orchard picking every tree clean, discarding the rotten apples and sorting out the choice fruit into one basket and the common into another. When the baskets were full he would make a bee-line for the barn, and kneeling down, empty the baskets on the barn floor, or on the grass plot in front. I also taught him many other useful things, such as packing the apples in barrels, with the proper arrangement of the best-looking specimens on top. It was indeed touching to watch the intelligence of an animal that is not usually considered as having enough sense to keep him out of the fire. I called him Sage (after my old friend Russel).

The white sacred cows of Burmah, after I had removed the remaining whitewash, proved to be just two ornery very old scrubs, and mighty ornery at that. These, I afterward sold to a peripatetic dealer in Jerseys, my hired man having ingeniously devised a hair dye that was a great success. These cows were always so thin in flesh, and with thin new coat of hair dye, that anyone would take them for Jerseys—if they didn't know the difference. The damages to the zebra were easily repaired, yet I always thought he would look better if he had not parted with one of his ears; the only other drawback was that, owing to the shock of the collision, probably I could never make him move forward. He always backed. If I wanted him to go to the barn, for instance, I was obliged to turn him around and say "git," and he would back straight to the desired spot and never make a miss. He would also draw any desired load, smaller than a load of hay, with his teeth, while backing.

The cage of brown melopotismians I never could make much of, and I never have seen anybody that could. They were a sort of cross between a 'coon, 'possum, muskrat, catfish and mud turtle, with all the bad qualities of each and not a good quality of any. They are for sale—anybody wanting some melopotismians can get this collection cheap, without waiting for a marked down sale. The camels are fine. I feel proud of that purchase for this reason: I had a white mule that could and would kick everything within reach, and keep on kicking. He would kick when there wasn't anything to kick at. He evidently hated everything on earth, including himself. One day he was prowling around the biggest camel, and apparently selecting some point of vantage to deliver a full battery of his most vigorous kicks. He never got a chance. The old hump-back suspected something, and when the mule came within range, she let out with both hind feet at once, and that mule didn't stop tumbling over himself until he struck the barnyard fence. You never saw so surprised an animal in this world as that devilish mule. He picked himself up and sneaked around behind the barn, and that was the last ever seen of him. The ostriches I have trained to plant corn and potatoes with great skill, while as potato-bug destroyers, they have made it unnecessary for to go to the drug store after Paris green. The monkeys and horned owls will require a chapter all to themselves.

Frank Haywood.

(To be continued.)

Natural History.

Addison on Animal Instinct.

Opening a little volume of "The Spectator" at random, I lit upon No. 120. "I must confess," says the genial writer, "I am infinitely delighted with those speculations of nature which are to be made in a country life; and as my reading has very much lain among books of natural history, I cannot forbear recollecting upon this occasion the several remarks which I have met with in authors, and comparing them with what falls under my own observation."

We usually think of Addison as only a writer of English of unsurpassed sweetness and excellence, but he was a close observer of nature, and finds many an illustration of his topics in the humbler life around him; thus he finds something similar to memory "in those several animals that are filled with stores of their former food, on which they may ruminate when their present pasture fails;" and looking around him he wonders to observe, as he says, "by what a gradual progress the world of life advances through a prodigious variety of species, before a creature is formed that is complete in all its senses," by the way tracing up an argument from the lowest forms of animal life to the highest that seems a foreshadowing of Darwin's doctrine of evolution.

There is a charming simplicity in these old observers of nature, Sir Thomas Browne, Izaak Walton, Gilbert White, and Joseph Addison. They lived in a simpler and clearer age, before science with all its close analysis had turned everything inside out, and before microscopy gone to seed had disgusted men with the discovery of loathsome bacteria, microbes, and what not in every crystal drop that distills from the rock and in every cherry that hangs red upon its twig.

The point at issue in Addison's "Spectator," No. 120, was the instinct of animals as against their reason. Of course he rather begs the question in advance by assuming that those who claim some intelligence for the lower animals claim it "to as great a degree as man," which is preposterous. Nobody has ever made any such claim, but only that animals possess reason within certain, perhaps very narrow, limits as compared with man. But to deny all reason and intelligence beyond simple instinct to the elephant, the horse, or the dog, it seems to me is to deny too much.

Addison seems to have made a special study of the hen. "My friend Sir Roger," says he, "is very often merry with me upon my passing so much of my time among his poultry; he has caught me twice or thrice looking after a bird's nest, and several times sitting an hour or two together near a hen and chickens." It was very well for him to argue his point from this fowl, for I suppose a chicken has less sense than any other creature of its size. We have had learned pigs and trained fleas, but an educated chicken we have yet to hear of. He remarks that the brute makes no discovery of reason except in a few particulars and within a very narrow compass; only so far, in fact, as regards the animal's own preservation or the continuance of his species. Take a brute out of his instinct, he says, and you find him wholly deprived of understanding. And that is just the point that some people deny. Then Addison proceeds to illustrate his doctrine by means of the barnyard fowl.

"With what caution," he says, "does the hen provide herself a nest in places unfrequented, and free from noise and disturbance? When she has laid her eggs in such a manner that she can cover them, what care does she

take in turning them frequently, that all parts may partake of the vital warmth?" He then goes on to speak of the manner in which the hen suits her necessary absences from the nest to the varying temperature of the air; with what strange intelligence she knows the exact moment when the chick in the egg is hatched; with what nicety and attention she helps the little creature to break its way out of its prison, and with what care she defends it and provides for it in its helplessness. "But," he continues, "at the same time the hen, that has all this seeming ingenuity, which is indeed absolutely necessary for the propagation of the species, considered in other respects, is without the least glimmering of thought or common sense. She mistakes a piece of chalk for an egg, and sits upon it in the same manner. She is insensible of any increase or diminution in the number of those she lays; she does not distinguish between her own and those of another species; and when the birth appears of never so different a bird, will cherish it for her own. In all these circumstances, which do not carry an immediate regard to the subsistence of herself or her species, she is a very idiot."

I have already expressed my own view of the very limited intelligence of the hen, but still I claim that honest biddy is capable of acquiring some knowledge, especially if it is in the way of being troublesome. For instance, my side porch faces the south. A window opens out on the porch. On a sunny day in the winter the chickens persist in getting on that porch to bask in the sunshine. I may stand at the closed window and wave my hand or my handkerchief and "shoo" for all I am worth, and the utmost regard I can win from them is possibly a turned up eye, but not the movement of a foot, though I am in plain sight and within two or three feet of them; but the moment I open the door ten feet away they all take to "instant flight." Now they have learned, and from very brief experience, too, that there is something in the window between them and me that makes it impossible for me to harm them. This is no instinct; this is acquired knowledge. A wild bird will fly away at my approach to the window as quickly as when I appear at the door.

Addison ends his beautiful essay with these observations: "There is not, in my opinion, anything more mysterious in nature, than this instinct in animals, which thus arises above Reason, and falls infinitely short of it. It can not be acounted for by any properties in matter, and at the same time works after so odd a manner, that one cannot think it the faculty of an intellectual being. For my own part, I look upon it as upon the principle of gravitation in bodies, which is not to be explained by any known qualities inherent in the bodies themselves, nor from any laws of mechanism, but, according to the best notions of the greatest philosophers, is an immediate impression from the first mover, and the Divine Energy acting in the creatures." T. J. CHAPMAN.

Nature and the Camera.*

IN a work of art there may be two motives, either to copy nature exactly—to make a record of facts—or to use nature as a means of expressing our own feelings. In his book entitled "Nature and the Camera," Mr. Dugmore has combined both these motives. He has been a leader in photographing living birds, mammals and fish, and the object of his present work is to tell how this has been done, so that others may do the same, and to interest boys and girls to look for the happy things in nature by which we are surrounded, but which we have not the eyes to see.

The camera has many tribulations, but Mr. Dugmore has happily overcome most of these difficulties. The first subject considered in the book is the photographic outfit. "To influence a man in the choice of a camera would be almost, if not quite, as absurd as trying to tell a man which gun to use." "A camera that may be best to-day might in a week's time be superceded by something so much better that the older one would be thrown aside for the newer invention." The matter of lenses—a consideration of the highest importance to the nature photographer—is discussed at length.

The photographing of birds' nests is taken up after the photographic outfit. "This calls for artistic sense, as so much depends on the composition of the subject and the lighting." "A nest properly lighted makes a beautiful picture, but the same nest taken without regard to the lighting is absolutely uninteresting," from the point of art.

A ground nest of simple form is the woodcock's, but the nests of crows and hawks are much more difficult. The kingfisher's nest cannot be photographed, as it is placed in a bank, and in order to get the picture part of the bank would have to be torn away.

Birds will desert their nests if the nest has been handled, so it is absolutely necessary not to disarrange the nest or its surroundings.

Do not let this work be an excuse for destroying bird life. Let it take the place of egg collecting, and both the birds and ourselves will reap the benefit."

The illustration of a wood thrush on its nest is very pleasing, while that of the cedar bird has the effect of being rather made up. In photographing birds on their nests, we learn of the existence among them of a marked individuality in temperament. Some are shy, while others are very bold. To be successful at this work, it is necessary first of all to let the birds know that you are a friend.

What could be more charming than the picture of the nest of the little marsh wren with the long, sweeping lines made by the cat-tails, which so suggest to us the marsh. The light coming from overhead shines on the nest, accentuating the dark hole by which the little brown bird enters its home. Such a picture brings to mind a thousand memories. And if in a picture we are stirred by an emotion kindred to that felt by the author in the presence of his subject, has he not succeeded in making a work of art? When Mr. Dugmore turns to photographing birds alone, whether as individuals or in families, his pictures, while not less admirable as representations of fact, are far less pleasing from the artistic point of view. This is, of course, inevitable. Birds will not pose for the artist; he must take them as he can, not as he would, and the opportunity for securing a happy pose or combination

LOCKED ELK ANTLERS.

of surroundings and light and shade occur very seldom.

In the same way, though for different reasons, the pictures of animals, reptiles and fishes, though true, are less interesting. Yet those of the antelope (p.80) and of the moth unfolding its wings (p. 90) are very attractive. With certain of his pictures of fish also, Mr.

LOCKED ELK ANTLERS.

Dugmore has succeeded very happily. That of the moon fish, from its position in the aquarium at the time of taking, makes an interesting composition in form and line.

Mr. Dugmore proceeds step by step and tells in such a clear and simple manner what one should do in that particular branch of nature study that one cannot fail to comprehend his meaning. His book is airy in structure and will, no doubt, be an incentive to many who desire to know more about nature by means of observation and photography. E. C. G.

* Nature and the Camera—How to Photograph Live Birds and their Nests; Animals Wild and Tame; Reptiles; Insects; Fish and Other Aquatic Forms; Flowers, Trees and Fungi. By A. Radclyffe Dugmore, author of Bird Homes. New York: Doubleday, Page & Co.

A Pair of Woodcock.

DID you ever while out shooting come across a bird or animal that appeared to have a charmed life? Did you ever waste shell after shell, or bullet after bullet, in vain endeavor to bag the coveted creature, only to fail ignominiously? Let me give you an experience of my own, in which a pair of woodcock figured as the coveted game.

One Sunday while out walking with a companion, we passed across a piece of marshy ground, near which was a fine spring. While we were carefully picking our way across, two woodcock suddenly arose from beside an old decayed log and flew swiftly in the direction of some wooded knobs on the opposite side of the marsh. I told my companion that I would come back on the morrow and attend to their order, and as I had never killed a woodcock, I was greatly pleased with the prospect.

The next day I took my gun and crept carefully through the bushes to the marsh. I beat about among the bushes for some time, but failed to raise the bird, and was about to retrace my steps when I heard a faint whir of wings to my left and looked up just in time to see the woodcock disappear among the thick bushes. I was disappointed, but resolved that they should not fool me the next time.

Again and again I visited the marsh, but always with the same results. The birds either got up out of range or dived into the thick bushes where it was impossible to get a fair shot. I generally sent a charge after them, however, hoping to bring one down with a stray pellet, but it was a mere waste of lead.

I was about ready to give up, but decided to try once more, so in company with my brother I set out for the marsh again. On reaching the place the woodcock, as usual, got up out of range, and although we both fired at them, they gained the knobs in safety and settled down in the bushes. We then proceeded up the side of the knob, and by good fortune flushed the birds again. As they rose we each chose our bird and fired. At the report of my gun the woodcock gracefully folded his wings and fell with all the dignity that he could command. No more would the echo of his wings be heard in the lonely marsh; the day of his happy reign was over. My brother crippled his bird slightly but it got away. The next day while hunting over the same knob he started it again and sent it to the happy hunting ground to join its consort. CLARENCE VANDIVEER.

MIAMISBURG, O.

Locked Elk Horns.

BALTIMORE, Nov. 24.—*Editor Forest and Stream:* Mr. J. J. Carter, familiarly known as "Pap Carter," who is one of the few remaining pony express riders, and who lives at Cheney, Wyoming, in the lower end of Jackson Hole, in getting his winter's meat this fall, ran across a black bear that was feeding on a bull elk, which had its horns locked with those of another that was still alive, although very near death from starvation. He killed the bear and found that in order to get the elk heads apart, so that he could pack them on his burro, he had to saw down through the skulls.

I inclose you a photograph showing the way in which they were locked. You will notice that both heads are freaks; one having eighteen points and the other fifteen. An interesting feature was that the largest elk, the one with eighteen points, had his neck broken, while the smaller was still alive. TAHENA.

Strange Tale from Michigan.

During the past few years we have frequently heard stories of black-tailed deer being killed in Michigan. It is said that the tip and underside of tail is jet black and that the animal is slightly less in size than white-tail deer. This description does not correspond with the mule deer, and in any event is too vague to be of use. If any of our correspondents should kill or know of such a deer, it is to be hoped that he will send a skin and a skull to Dr. C. Hart Merriam, Department of Agriculture, Washington, who will be able to tell us what it is.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

Collecting a Cooking Outfit.

THE novice at camping out experiences not a few annoyances in the matter of selecting proper cooking utensils for his needs, and if he has no advice from seasoned campers-out, who have gone through the mill often, the result must be a waste of time and money ere he gains an insight into just what he does not need, rather than the other thing. This is especially true of beginners at canoeing. They generally purchase too many articles, and too bulky ones. This they learn for themselves in time, and the result is that a new outfit becomes a necessity, and in the purchase of this they exercise more judgment. Still, this one must, of course, be gone over as more experience is gained, so that in a couple of seasons all the articles are new, and the original ones represent some money wasted.

I do not refer to cooking outfits for several people, but to those suitable for the use of two men—for it is conceded that the lone camper will invite a friend to go along with him occasionally, and an outfit for two will comprise only a few little extra articles like spoons, cups, forks and knives. Old-time canoeists who camp throughout the warm season, have learned from hard experience that it is not wise for several men to club together in the matter of provisions and cooking outfits, even while several persons are cruising together. Several persons may thus agree to meet at a certain place and start for a cruise of a given number of days. One man is expected to carry half the provisions, another the cooking outfit, a third and fourth the tents, a fifth the blankets, and so on. Business detains one, sickness another, the third is delayed. The result is that some have gone ahead, expecting all hands to meet at the first camp. They wait and wait in vain, then take an inventory of the articles that have been brought along, as agreed. The situation is laughable, but serious and exasperating at the time. There may be several pounds of coffee, but no coffee pot; three tents without poles and pegs; several pounds of butter, but no bread; etc. Experiences like this have taught the lesson that each man must take with him his own complete outfit throughout. He may cook and eat his meals alone, if he prefers, or several persons may club together in a general mess. This latter is often done, but as a general thing, the different members of a party pitch their tents close together, but each one attends to his own needs. There is no selfishness in this. Rather habit, and a good one. What applies to canoeing will also apply to hunters, fishermen and others who prefer to be independent while in the woods, and who may transport their outfits on ponies, burros, or by boat or train.

As it is true that in time the woodsloafer learns to buy the best articles he can afford, it is well to bear this in mind; provided one is sure. If not, then the cheaper the article the better at first, as weeding out will be less costly. One may purchase complete cooking outfits of aluminum, and these are superb in many respects, but they are costly as compared with granite and agate iron ware. The latter are so generally used they will be given the preference here in some respects. Go to the largest hardware or department store near at hand, and ask to be allowed to make your own selections, in your own time, and do this carefully from a list previously prepared. Don't let the sales people advise you.

First select three granite ironware plates. This ware

is blue outside and white within. The enamel is hard and smooth, and they not only look clean but are easily kept in that condition. They will not bear heat unless filled with water.

Then purchase an agateware frying-pan that will rest inside the nested plates. This ware is grayish and will chip only after long use over the flames. When you get home, file the long handle off smoothly where it is riveted to the pan. Explanation further on.

Next comes a granite-ware pan that will nest within the frying-pan. It should be three inches deep. Then select two smaller pans, of the same ware, that will nest within the larger one.

Now for a coffee-pot. An article is made of agateware, which is merely a very large cup, with a loop handle and tiny spout. The cover is tin. The pot has perpendicular sides, is seamless, and holds about three pints. This nests within the pans. If aluminum cups are preferred, purchase two that will nest within the coffee-pot; otherwise get granite-ware cups. In either event, cut the loop handle of one of them just above the bottom rivet, so that this cup will nest within the other one. Now buy a tea-ball a trifle larger than a hen's egg and of that shape. In use this is filled with ground coffee, closed tightly, and dropped into the pot while the water is heating. Let the water boil a half minute, and the result is a pot of clear coffee, all the grounds remaining within the tea-ball. There is still space in this pot for salt and pepper shakers, which will be mentioned elsewhere.

Purchase a granite-ware kettle having a wire bail instead of a long handle. This should hold about a half gallon of water, but if two kettles are desired, a larger one should be selected, then a smaller one that will drop within the other. In either event, see that the deep pan resting within the frying-pan will fit one kettle, as it may thus be utilized as a double boiler. Within the kettle, or kettles, a number of small articles may be stowed, in order that all available space may be utilized.

For knives there should be one with a keen edge. Every camper should carry a good sheath knife with a four or five-inch blade, and this will serve at table as well as in a dozen other capacities. It should not be one of the cheap abominations with a long blade and a guard, but a modern knife with a sheath fitting it snugly and leaving only an inch or so of the haft protruding, otherwise it will be lost out easily. It should be of the best steel and by no means a cheap affair. Several knives forged from tool steel are to be had of the sporting goods trade. These cost about $2, and are worth it. It is a waste of money to purchase an iron knife. The second knife in the outfit may be a round-pointed table knife the home folks have discarded. Purchase six aluminum spoons, four of them small, the other two tablespoon size; and two aluminum forks. Next comes a whetstone. Get one about six inches long, an inch wide and flat. One that is used while wet. It should cost ten cents, but will increase in value the longer you carry it. The ax and knives may be kept sharp with a little judicious use of this tiny stone. It will be worth its weight in gold very often. Purchase a pair of cheap pliers about six inches long and resembling blacksmiths' tongs in form. These are for picking up hot kettles and pans, and make it possible to do away with long-handled pots and pans that will not nest with the other utensils. Now, these forks, spoons, and small stuff should be kept in a box selected for the purpose, and there is nothing better than a tin biscuit box or can some ten inches high and two in diameter, with a tight lid. Otherwise the small stuff is always mixed up with other articles.

A five-cent tin-bound asbestos mat is needed if you cook over a vapor stove, and this mat will go with the plates. For toasting it is serviceable.

The camp ax does not properly belong with the cooking outfit, perhaps, but if the latter is stowed away in a wood grub box, a handy place for the ax will be in a leather pocket within the box. Select an ax forged from the best steel. One weighing a pound is large enough, and it should cost $2 at least, and be guaranteed by the maker. As with knives, so it is with axes, and there is nothing that will teach a novice to use weird and strange oaths more quickly than the possession of an ax that will not hold an edge ten minutes. I have heard campers say of their axes that the glance of a steel blue eye would turn the edge. You don't want this sort. Get a good one.

Now for the salt shaker. The only article I have ever seen that would not absorb moisture in a damp climate is a rubber iodoform shaker sold by wholesale pharmacists' supply houses for surgeons' uses. This is an inch in diameter and about three in length. On either end is a screw cap. One cap is unscrewed for filling; the other one protects the perforated end. These cost about 75 cents, but are worth the price. For salt it is necessary to slightly enlarge the perforations. Recently these shakers have been offered for sale by some firms in the sporting goods trade. For pepper get a small glass bottle with a metal screw top and drill a few holes in the top—very small holes. Pepper is not a moisture absorber.

If a grub box like that described by me in FOREST AND STREAM of Nov. 8 is used, there will be two places in it occupied—one composed of the kettle or kettles, the other of the plates, pans, etc. Each stack of nested articles should be about seven inches high by nine or ten in diameter, so that there will be ample space left in the box for provisions, etc. For coffee and sugar, tin cocoa or baking powder boxes will answer admirably, while matches require a smaller can or bottle with a tight cap. Meal, flour, rice, baking powder, etc., will be handy if kept in tin cans of proper size. Tins with seamless caps or screw caps may be had at the pharmacists' supply houses, and by going there one may select the exact sizes he requires. These firms also sell screw-top glass jars with tight cork inner caps, and these are admirable for butter, preserves and the like.

If a vapor stove is employed—and these are generally used by canoeists wherever kerosene may be purchased—the oil can be carried in nothing so handy as quart cans with stoppers that screw out half-way and expose the opening of a tiny spout for pouring. These are made by the can trust for heavy oils, leather dressings, etc., and cost ten cents each. When properly closed a leather valve prevents any kerosene from escaping. The wood alcohol for priming the vapor stoves is generally carried in a small glass bottle. The stove, two oil cans, and other small articles can be stowed in a bag made for the purpose, and another one will contain all the cooking utensils, if no box is used. An outfit need not be so compact if one has an open canoe, or travels by wagon, and when there is sufficient room to stow bulky parcels there is nothing more serviceable than the cheap tin bread box sold at hardware shops. One may be utilized for stowing away the vapor stove and other articles that may not be injured by kerosene, while another one will answer for the provisions. They are waterproof save when entirely immersed, and if the lids are fastened down, they may be left outside in all sorts of weather without fear.

Another handy article that properly belongs with the cooking outfit is a small bunch of candles. Paraffin candles six inches long are cheap, clean, and very handy in camp if one wishes a light for a moment to hunt for some misplaced article in the tent, etc. They may be old-fashioned, but they are, nevertheless, valuable for temporary uses.

PERRY D. FRAZER.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Notes: Some —— and Otherwise.

A RECENT allusion in FOREST AND STREAM columns to "Breakneck Spring," started Juvenal's thinker, and now his pen. The spring referred to is far away, but it instantly recalled visions of a marvelously clear, copious, cold and refreshing spring at the foot of Breakneck Hill in the Adirondacks, and known, of course, as Breakneck Spring. The hill is rightly named, for it is steep and rough—hard climbing; while the descent of the bank above the spring, unless made carefully, might easily result in the name becoming a reality of experience. But the spring itself! The pool of water is some three to four feet across, and about ten inches deep in the middle, where the water gushes up through the sand. It is the coldest pure spring water the writer ever saw, with one exception. In Rutland County, Vt., at a spot known locally as "the ice-bed," a spring flows from under a pile of slide rock at the foot of a mountain. Far under the rocks ice is found in midsummer. This water is so cold that care is necessary in drinking it, and the air is chilled for several rods' distance in the small ravine leading to the spring. Of course, it is a resort for local pleasure parties. Breakneck Spring is a resort for lumbermen and sportsmen. Many times have Juvenal and his comrades filled canteens at the spring and carried the water for miles, because it was so superior to that found elsewhere, and returning, whether empty handed or laden with spoils, it must be some cogent reason that could prevent a little aside from the trail to drink and rest at the spring.

Names—Natural vs. Unnatural.

Now the thought in mind when the pen started (though perhaps the path to it is as long and devious as a forest trail), is this: The fact that the same name, "Breakneck Spring," is applied to two springs so far apart and doubtless from the same cause, viz., the surroundings, illustrates a natural naming process. Facts appeal to the child of nature, so we have many Panther Mountains and Wolf Ponds, many Breakneck Hills, with their corresponding springs, and many other applications of the same principle of naming according to natural suggestion. Those most real children of nature, the Indians, made most extensive use of this principle, and so their nomenclature is not only descriptive but historic. Their names express natural fact, or real experience at will. With suitable limitations is not this better than tacking on names that are so far fetched as to have no meaning—e. g., the many names of cities along the N. Y. Central, classic, indeed, but unnatural here. The writer is not opposed to the classics or to classical names, and hence to that which is both natural and poetical, whether in fact or in name.

The Caliber Question Again.

As so many writers keep at this, both in FOREST AND STREAM and in other publications for sportsmen, permit a brief statement of facts relating to different cases the past season:

Case 1.—A friend of the writer went to far northern wilds in Ontario for moose. One morning his Indian guide saw a deer on the mountain side, so far away that the white hunter's eye could see no sign of game, but going carefully up the mountain to the spot he came face to face with a beautiful doe within twenty-five yards. But he did not shoot—he was after moose. His opportunity came at length. A monster moose swimming across a bay was pursued by a canoe, and as the animal went ashore, shooting with a .30-30 began at about 150 yards. Soon at closer range the third shot brought down the bull with a bullet in the neck. The Indian would not approach, and for a long time prevented the white man, but finally the hunter determined to end the sufferings of the animal, so went carefully close in and gave the quietus with a ball at the base of the ear. Dissection showed that the second ball struck squarely against the shoulder blade and went badly to pieces, doing no real damage. The third ball, which dropped the bull and so paralyzed him that he could not get up, lodged among the vertebræ of the neck without breaking any bones or being itself broken. Soft-point bullets were used. The bull was estimated to weigh over 1,000 pounds. The hunter is satisfied that the .30-30 is not a moose gun. Yet some would think the above pretty good luck with any rifle.

Case 2.—The gentleman who went on the trip with Case 1, also carried a .30-30. He also got his moose, but it was after fifteen shots at various distances—none of them long—and at various parts of the anatomy. The shots were in strings of three to five, and while they all landed somewhere on the target, none of them were "bullseyes." During the shooting the bull managed to cover considerable ground, and the pursuit was mainly by canoe. After the poor brute was down and thrashing about in mortal agony, he was allowed to suffer for hours, and only then put out of misery by the courage and action of the gentleman in Case 1. He made a torch and succeeded in getting a guide to hold it for him while he shot and killed the moose. Case 2 knows the .30-30 is not a moose gun. Some might ask if in his hands any other rifle would have done any better?

Case 3.—Another doctor (both the preceding were M. D.'s). The same is also in Canada, but in another portion, the man is a veteran sportsman, and the rifle a .40 caliber, with a record on game. The moose were at home to their visitors and furnished plenty of entertainment in the way of photographing specimens. When the time for a fine head came the doctor was so sure of his shot and its effect that although the moose disappeared, the next morning, when attempting to follow and secure him, the doctor coming suddenly within a few yards of four moose, did not shoot because one moose was enough, and he was supposedly safe. He was, but in another sense. The doctor says that when he goes after moose again he will have a heavy express rifle.

Case 4.—The writer's long-time hunting companion in the Adirondacks shot a deer at 200 yards with a .30-40. The soft-point bullet entered back of the shoulder about one-third of the way up on the body, ranged backward somewhat, and came out back of the ribs on the other side. The bullet hole at exit was large, and the interior of the animal badly lacerated by the mushroomed ball, yet that deer ran about 150 yards without external bleeding, so far as noticed, and was found only by careful search.

Case 5.—The writer shot a deer with a .30-30 soft-point bullet at a little over 100 yards. The deer was partly in alder bushes and walking slowly. The ball entered just forward of the shoulder, about one-third of the way up on the body, made a large hole, where it came out just at the opposite foreleg, and cut that leg clean off, so that it hung by a little skin only. Yet this deer managed to run about 150 yards, most of the way being plainly marked with splotches of blood. In fact, there was practically no blood left to follow the knife at the throat.

What do these cases prove? Nothing decisive. But they illustrate

(a) That game animals often act differently from what the hunter wishes or expects; also differently from one another; some will show remarkable vitality, while others easily succumb. (Plenty of moose have been killed almost in their tracks with small caliber rifles.)

(b) That to stop a big game animal immediately it is necessary to hit a nerve center. Do that with any rifle and the game stops.

(c) The man behind the gun still counts. Yet circumstances such as light, position of game, etc., will affect any man and sometimes limit success.

The smokeless powder and flat trajectory of the small calibers is greatly in their favor, the records prove they do get game, and as to the shooting of men, it is certainly true that in most places where large game may be properly shot with any rifle, the small-caliber, long-range rifle may be as safely used as any other. The whiskey danger is greater than any other—it disqualifies the guide and the sportsman alike—and when it is both at the same time, as is frequently the case, look out. If those who have so much to say about what is "sportsmanlike" and "unsportsmanlike" will take up this issue in earnest and help create a universal sentiment that it is really unsportsmanlike because unmanly, to carry intoxicating beverages into the woods—either in the man or in the pack—they will do more toward the elevation of sport and sportsmen than all their talk about methods of taking game and fish. That our highly prized FOREST AND STREAM may nail this banner to the mast and lead the way to victory, is the earnest wish of

JUVENAL.

Preserving the Equilibrium.

DURHAM, Kas., Dec. 8.—*Editor Forest and Stream:* Your recent article on yellow journalism, and Mr. Flynn's remarks concerning it, coupled with numerous other articles I have read of late, induces me to dip into the subject and go round and round a few times like a chip in an eddy. It seems almost impossible for the average mind to understand what true protection for game and song birds really amounts to. The fad is on and has brought into the ring its thousands of rabid protectors who do not know a bird from a balloon. Out of the ensuing babble comes chaos. Just now the craze runs to squirrel protection, and it is usually argued as if there were really something sacred about the little beast that makes it a crime to kill it at all, no matter what the conditions. This is nonsense of course. The proper mission of protection is to maintain an equilibrium. The farmer who killed all his poultry and pigs in the spring would be much better off than one that did not kill them at all, but kept them till they died of old age. The open and close season on game is supposed to maintain this equilibrium after which game is supposed to be killed and used for any useful purpose the same as all domestic things brought under man's dominion. There is no open season on birds not considered game because there seems no reason for killing them, yet in a recent farm journal I read an account of several thousand being killed at considerable expense to protect a single fruit farm.

The squirrel is of no value except as their flesh is good to eat and the skins good to make into coats. They have no more right to special protection than have pigs or poultry. When they become sufficiently numerous they should be so used, for their capacity for mischief is considerable. The maintaining of correct balance is all there is to it, and how to maintain that balance is all there is to argue about. The question of cruelty to ani-

mals does not come in here at all. That is a question as to whether the killing is purely wanton and unnecessarily cruel and vindictive or not. The rest is a mere question of economy. Not sentiment, but common sense.

I think I hear a few hundred thousand fadists say, "Umph, is that all," when brought to understand this, "we thought there was some fellowman to run down and persecute at the end," and then the subject would be dropped with a sigh and the chase would tear away into some new field.

Among the most disgusting things anent the squirrel question is a criticism of President Roosevelt's sons. According to a newspaper account the boys were returning from the woods where they had been squirrel hunting. They had two squirrels, one each. On this meagre account the critic takes them up and censures the President for training his sons to shoot squirrels. Who could begrudge the boys their two squirrels? Certainly it should not be one who has written himself down in history as the most wanton game destroyer in America. I thought what a noble thing it was to teach those boys woodcraft instead of bringing them up in the path of the ladedah, in which case they might become fadist some day. Such rot makes me want to own a number ten boot that runs by steam and then have said critic inside a forty acre lot. E. P. JAQUES.

Boston Notes.

A Deer Killed Within Six Miles of the State House.

BOSTON, Dec. 13.—*Editor Forest and Stream:* As reported in one of our daily papers last evening, John T. Collins, of Malden, shot a doe on Dec. 11 in Maplewood. When he tried to sell it to a provision dealer he learned some things about the game laws that were new to him. No doubt, in due time, he will gather more information, which is likely to remind him of the old adage, "Experience is a dear schoolmaster."

Last summer a gentleman reported finding a deer's carcass in Lexington, within ten miles of the gilded dome. The hind quarters had been partially removed. No clue to the perpetrator of this slaughter, so far as I know, was ever obtained, although diligent efforts were made in that direction.

Such cases, I believe, are quite rare, and the time is fast approaching when they will be a thing of the past, unless all signs fail. The people are waking up to the importance of caring for wild animals and the birds, and there is abundant evidence that all the more intelligent men and women of Massachusetts frown upon illicit and wanton killing. Chairman Collins has been very busy of late in preparing the report of the commission, which will contain much information of especial interest to sportsmen.

Next Monday will be the last day for quail shooting in Bristol County. Your readers will remember that by dint of persistent efforts the members of the Legislature from that county secured a change in the bird law last winter, making the open season on quail from Nov. 1 to Dec. 15. If the quail hunters all abstain from shooting partridges in December it will be rather remarkable. This change was strongly opposed by Representative Hunt in behalf of the North Attleboro Association, and by the sportsmen generally all over the State, for the reason that they think it much easier to enforce laws applying to the State as a whole. A season's experience of the present law may be sufficient to convince our friends in New Bedford and Fall River that they made a mistake.

A 'Coon Supper.

Mr. C. W. Bowles, a veteran 'coon hunter of New Bedford, recently returned from a successful hunt in South Amherst. There were several in the party, and five 'coons "came down," the largest weighing 22 pounds. Among those in attendance at the banquet given by Mr. Bowles were George E. Thayer, G. F. Thayer, C. S. Tillson and others, of Amherst; Irving Quimby, Capt. F. A. Jenks, Louis Fournier and others, of New Bedford. The game was prepared in many different ways, and furnished a rare treat to Mr. Bowles and his friends.

Shipments of Game.

Up to last Friday night there had been shipped through Bangor the present season, 5,124 deer, 191 moose and 27 bears. More shipments have been made from Greenville than from any other town, viz., 465 deer, 14 moose, 8 bears. Other important shipping points are Patten, Norcross and Staceyville.

One surprising feature of the season is the large number of successful women hunters, they having shipped through Bangor 126 deer and 2 bears.

By inspecting a list of about 100 names of ladies who have returned with deer, I find 27 of them are from the old Bay State. For one I think it is a capital thing for women to get such outings. More of them should "take to the woods." I wish them the best of luck.

You have heard of one of the famous rifle shots of Massachusetts, whose record at Walnut Hill rifle range is among the first, Mrs. Patridge ,and there are others.

Some of the Bostonians recently returned with game are P. J. Abbott, Eugene Coffin, Mrs. E. Knight, C. F. Eaton, F. S. Brown, O. A. Burrill, W. J. Dodd, T. R. Tarrant and E. H. Dickinson. CENTRAL.

"As His Father Did Before Him."

MORGANTOWN, W. Va., Dec. 8.—*Editor Forest and Stream:* No doubt it is difficult to produce something that pleases all people, and while there may be some who would not take a second glance at the supplement of Dec. 6, "As his father did before him," yet to me it is the most pleasing picture that has been sent out with the FOREST AND STREAM, while they have all been highly pleasing and are prized beyond a money value. I wish therefore to thank you specially for the pleasure I have had, and will have in feasting my eyes on this splendid reminder of the days agone. EMERSON CARNEY.

Winning a Maine Trophy.

MR. AND MRS. HENRY A. CAESAR returned to New York few weeks ago, after spending the month of October on a shooting expedition in the wilds of Maine. They have added as a result of their trip a dozen or more superb trophies of the chase to their already remarkably fine collection.

Of these evidences of their skill and prowess in field and woods, Mr. and Mrs. Caesar are justly proud, for the series of mounted heads which graces the hall and dining-room of their town residence, is one of the finest private collections in New York. Its most interesting feature is that it has been brought together by their own personal skill with gun and rifle.

Occupying places of honor on either side of the great open fire-place in their stately dining-room hang the most recent trophies of their hunting, the majestic heads and antlers of two immense moose killed by Mr. and Mrs. Caesar on their recent expedition in the "Pine Tree State," and thereby hangs this tale of a moose hunting trip which Mrs. Caesar was prevailed upon to tell.

"After shooting a seventeen-point buck in Maine last year," said Mrs. Caesar, "I felt that I should like to shoot at bigger game, and Mr. Caesar being of the same mind, we started on a moose hunting trip last October.

"Taking St. Francis, Quebec, as a starting place, we made an all-day drive of forty miles to St. Justine, where after resting over night we journeyed five miles to Black

MRS. CAESAR AND HER MOOSE.

Brook, also in the Province of Quebec, where, by appointment, we met our guides, one of them being Will Henderson, of Jackson, Maine, who had been with me on many hunting trips before.

"We then proceeded along the Duquan river to a point where it empties into the northwest branch of the St. John's River, stopping over night at Sand's Camp, which is just on the boundary line between Quebec and Maine. The next day a short journey of twelve miles brought us to Bogan Brook, where Mr. Caesar had had a hunting lodge built during the summer.

"There had been a slight snow fall and the air was deliciously crisp and invigorating. So far in our journeying we had not met with a person outside of our own party. The country was wild in the extreme, and all about were silent and solitary forests of spruce, birch and alders. We found the surrounding streams and brooks fairly alive with trout, and the woods really teemed with birch partridges which we found exceedingly tame in comparison with the Pensylvania partridges.

"It was the second day in camp when I succeeded in bagging the game I was after. With Henderson for my guide I went down the river prospecting for moose and deer tracks, while Mr. Caesar and his guide went the opposite direction. We had proceeded about three miles when, on emerging from the bush to the burnt land, Henderson, who was a bit in the lead, quickly turned, and springing lightly over a windfall, tossed my rifle to me and cried, 'Shoot! Shoot!'

"An instant later two moose bounded into sight about one hundred and fifty yards away, the foremost one almost as quickly disappearing into a thicket. I 'banged' at the second moose and he fell sprawling, but was up and in flight again in a second. We followed in hot pursuit and fifty yards from where he fell we came upon him breathing his last.

"I had used a .45-70 Winchester one-half mantle bullet, and the shot had taken effect in the shoulder. There lay the huge animal still in death, and my mission to the Maine wilds was accomplished. I had killed my moose. When we reached the spot where the fallen monarch lay Henderson declares that so great was our mutual feeling of surprise and jubilation, that we stared at one another for fully ten minutes before either of us spoke.

"The moose proved to be an immense fellow, Henderson estimating his weight at over 1,200 pounds. The horns had a 52-inch spread and had fourteen points, and proved to be one of the finest specimens secured in Maine during the season.

"In cleaning the head of the moose Henderson met with an unfortunate accident. He cut his finger, and blood poisoning setting in, his hand swelled to an immense size. Fortunately we found a physician who was spending his vacation at Sand's Camp, and the wound having been promptly dressed, Henderson was soon out of danger and himself again.

"Although we saw a great many moose tracks, it was not until about two weeks later that Mr. Caesar succeeded in getting his game. After long days spent in traveling the burnt woods and marshes he finally secured the desired shot and brought down a fine specimen with a 44-inch spread of horns with thirteen points."

It is these two new fine heads in their superb collection that Mr. and Mrs. Caesar now point out to their friends with natural pride.

Next fall Mr. Caesar will go to Wyoming to hunt elk. Mrs. Caesar will accompany him, but it is her full purpose not to return until a grizzly bear falls a victim to her unerring rifle.

Newfoundland Caribou.

MR. E. A. RICHARD, of this city, who has hunted big game in various sections of this country, tells an interesting story of his recent expedition to Newfoundland after caribou and other game. It was Mr. Richard's first shooting trip to Newfoundland, and he had as his companion Mr. H. R. Kidney, of Auburn, N. Y.

Both Mr. Richard and Mr. Kidney met with all the success that the most enthusiastic sportsman could wish, and the tale of their doings, observations and adventures during their month's visit to that island spot will doubtless be read with interest, and may inspire other hunters to visit that region next season, when the high license fee and certain other game restrictions passed by the authorities last February, are likely, in Mr. Richard's opinion, to be much modified.

"Our objective point," said Mr. Richard, "was Hawley, which is located in about the center of the island, and in the very heart of the caribou district, and there we arrived by easy stages early in November. In the beginning we were fortunate in securing the services as guide of Robert B. Stroud, of Boni Vista Bay, who, we were told, was the most experienced guide and hunter in Newfoundland. As far as we were concerned, it is a pleasure to say that he lived up to such a reputation.

"Stroud secured for us the services of two packers and a cook, and it may interest many who contemplate a hunting trip to that region to learn that the labor of all four men was secured for the modest sum of seven dollars a day, which they regarded as ample compensation. Like most of the natives we encountered, our men were all of either Scotch or Irish descent, and honest, reliable and God-fearing to a degree. There was no hunting or shooting on Sundays, and so strong was their dislike to alcoholic stimulants that one of the men, named Elijah, could not be persuaded to carry a pack that contained a bottle of whiskey. Compared with the French-Canadians, whom I employed on a moose-hunting expedition on the waters flowing into Hudson Bay, they were indeed models of their kind. The former, to judge by my experience, and that of a number of my friends, are often found to be lazy, indifferent and hard drinking.

"Contrary to our expectations and adding greatly to the pleasure of our trip, we found the climate not especially cold. During our stay we had only a few flurries of snow that were not at all disagreeable, and there was but very little rain. The thermometer never recorded lower than twenty degrees above zero, and during the day time it averaged between forty and fifty.

"In former years the open seasons for shooting caribou were from July 15 to Oct. 1, and from Oct. 20 to Dec. 31. Last February, however, the authorities made the open seasons for this year from July 15 to Oct. 1, and from Nov. 1 to Dec. 31, thus closing the entire month of October. Whether this law will continue in force remains to be seen.

"Another act of the authorities last February was to raise the license fee for hunting caribou to $100 for three bucks. It appears to me that by so doing they killed the goose, so to speak, that laid the golden egg, for according to the figures given to me by M. Pike, game agent at Port au Basques, only twenty-seven hunters had taken out licenses up to Nov. 20, while up to the same date last year over five hundred licenses were issued. As one of the authorities said to me: 'We guessed you Yankees could afford to pay $100 just as well as not for the privilege of shooting our caribou, but there are evidently not enough of you who feel like doing so, and next February I'm pretty sure that down will come the price again.'

"We also learned that the authorities had prohibited the shooting of caribou along a stretch of fifteen miles on the railroad track at Hawley, and also for five miles on either side of the track, thus making a belt fifteen miles long and ten miles wide, where the caribou enjoy absolute immunity from hunters. This particular tract of ground was in former seasons a favorite spot for many hunters, for when the caribou migrate from the north to south on their way toward the straits of Red Indian Lake, they are compelled by the conformation of the country to cross this now proscribed portion of the railroad track, and their slaughter was immense. It was almost like shooting at the animals in a pen, and I think the new law, in this respect, a wise one, although it does make the hunting a deal more difficult.

"So we found it necessary in order to secure our game to pitch our camp back in the hills, between the railroad track and Red Indian Lake. The country there is one continuous bog or marsh, dotted everywhere with countless thousands of little ponds and larger bodies of water, and nevertheless rough and hilly in the extreme. In all this stretch of seventy-five miles there is scarcely a patch of woods, only clumps of bushes here and there.

"We pitched our camp about forty-five miles due south from Hawley in the shelter of some half-grown trees, which afforded us a protection from the wind storms, which at times are quite severe. A 'look-out' line was then chosen about a mile and a half from camp, and here we built a lean-to of hemlock boughs,

"I had many times heard stories about the abundance, or, rather, super-abundance, of caribou in this particular portion of the country, but was scarcely prepared for the sight which greeted our eyes the day after we had pitched camp, and which continued all the days that we stayed there. It was the height of the migratory season, and the number of caribou that daily crossed our vision from our look-out station seems incredible.

"The smallest band that we saw together at any one time numbered three animals, and the largest one hundred and two. Herds numbering from six to seventy-five were espied daily. Although the work of stalking them was exceedingly difficult on account of the bogs and swampy condition of the soil, which makes a tramp of a few miles exceedingly arduous and fatiguing, we found that the killing of our complement of bucks was practically simply a matter of selection. Altogether, we figured that over eight hundred caribou passed within our view, during our stay in camp.

"Leading from the direction of Hawley we found a trail six feet wide and beaten down almost as hard as asphalt by the herds of caribou that passed along it, making for Red Indian Lake. Along this trail I succeeded in photographing a fine buck, with a Series 2 Zeiss lens at a distance of seventy feet.

"In addition to the caribou we shot, we killed numbers of Arctic hare and ptarmigan, or snow grouse, which we found delicious eating. Foxes were also rather plentiful, and altogether this shooting trip in the wilds of Newfoundland was a pleasurable and gratifying success in every particular."

California Shooting.

The California Game and Fish Commission made an important capture on Tuesday last, which will go far toward stopping the illegal traffic in quail, ducks and other game birds by commission merchants and cold-storage companies in this State. Ever since the quail season opened on Oct. 1, complaints have reached the commissioners that the law-respecting sportsmen found this wily little California game bird unprecedentedly scarce, and the quail grounds sown with empty shells—the tell-tale earmarks of the "sooner." Chief Deputy Vogelsang at once started on a still hunt and quickly learned that various firms of commission merchants were flooding the State with circular letters directed to market-hunters in the interior offering big pecuniary inducements to them if they would violate the lw. In some instances as much as $2 per dozen for quail and all transportation and other expenses were guaranteed by the commission merchants. As the State is large and the appropriation small, Mr. Vogelsang was having "mighty hard hoeing," until fortune favored him. John F. Corriea, of Cain, Boyd & Corriea, addressed one of these circular letters to B. S. Smith, an Oroville shopkeeper, who enjoys a local reputation as a wing shot. Mr. Corriea did not happen to know that Mr. Smith was a Deputy Game Commissioner, and Smith did not go to the trouble of informing him of this important fact, but forwarded the commission man's letter to Mr. Vogelsang. The Chief Deputy wrote an enthusiastic letter concerning the prospects of building up a colossal business in illicit quail and sent it to Smith, who signed it and forwarded to Corriea. The latter took the bait like a fresh-run steelhead. By return mail Smith received a letter telling him to pack not less than fourteen dozen quail in a trunk and check the trunk to this city and mail the check to Corriea, who would send a man to the baggage office to get it. Deputy Warden Kertcheval took the train for Oroville, and he and Smith packed the decoy trunk, but prior to doing so they spent three days wandering through the woods and cañons collecting the necessary birds. Twenty-six quail, one more than the legal limit, was the total bag, and these were packed in a trunk with sundry pieces of lead-pipe and a few brick-bats to increase its weight. A representative of the commission firm called for the trunk and presented the check, and Corriea was promptly arrested, but made light of the matter. Immediately upon his arrest he wrote to Smith, telling him to make himself scarce, but the astonishment of himself and of his counsel was boundless when the first witness called for the prosecution was Mr. Smith, of Oroville, who produced all the Corriea letters and testified to the facts as set forth herein. The prisoner's counsel immediately applied for a continuance, which was granted. Mr. Vogelsang has a number of other commission firms on his list and further prosecutions are in order.

The continued fine weather has seriously interfered with duck shooting in northern California, as the steady flight has not as yet begun. In no instance has an individual member of any of the many ducking clubs about the bay recently bagged the limit, which if fifty ducks. Mr. Hermann Oelrichs, on his private pres;erves in the Suisun marshes, came near it last week, returning to the city with forty-five ducks, mainly canvasbacks and sprigs. Mallard so far have been very scarce this year, although teal seem to be comparatively plentiful.

San Francisco, Dec. 2.

The Corriea Case.

As intimated in these columns last week, the prosecution of John F. Corriea, the commission merchant who was so cleverly caught red-handed by Chief Deputy Charles A. Vogelsang with illicit quail in his possession which had been shipped to him by one of Mr. Vogelsang's deputies in response to a circular letter, couched in alluring terms, has begun to bear most excellent fruit. On the 8th inst. Police Judge Cabaniss convicted a Portuguese clothing merchant, named Silva, with having twenty-four dozen quail in his possession. These birds were shipped by market hunters in San Luis Obispo County, and the Commissioners have evidence that Silva was acting for Corriea in the matter. A case against another go-between, involving thirty dozen quail is yet to be tried. Corriea himself is making a strenuous fight to keep out of jail; but a final decision of the case is expected by the beginning of next week. The Commissioners have been extremely active this season in enforcing the game laws and great credit is due them and their energetic Chief Deputy, as the appropriation at their disposal for game protection amounts only to $3,600.

A Mediaeval Recrudescence.

Deputy Game Warden Robinson, of San Rafael, received a call the other day from a stranger who complained to him that an unknown foreigner was at that moment engaged in killing quail by some illegal device or other on the Hearst property near Fairfax. The stranger did not state what the device was, but Robinson saddled his horse and rode to the place in question without a moment's delay. There he found Jules La Shelle, a San Francisco Frenchman, hunting quail with a trained falcon. La Shelle informed him that he had purchased the bird from the captain of a French vessel. It was a magnificent specimen of the peregrine falcon and had evidently been carefully trained, returning to its perch on its master's wrist whenever he whistled. A sprightly little fox-terrier flushed the birds for Monsieur La Shelle and the bird-hawk at once sailed in and did the rest. Robinson was an interested spectator of the performance for a couple of hours, during which period the falcon killed three quail. In speaking of it afterwards, he said, "Hawking is not prohibited by the game laws and there is no particular reason why it should be. A healthy man with any sort of an old scatter-gun would have bagged at least eight quail out of the four bevies flushed, in the time that it took La Shelle's hawk to dispose of three birds."

On Unhappy Hunting Grounds.

The number of ducking clubs controlling marsh lands to the north and south of San Francisco has increased so amazingly during the past three years that the annual rent of some of these favored localities has more than quintupled. As most of this tide-land and tule property is unfenced, altercations between members of rival clubs concerning the boundaries of their respective preserves have become very common. The Swan Gun Club, of which Deputy Game Commissioner C. G. Gould is president, controls the shooting rights of a large territory in the Alvarado marshes, and its next door neighbor is Mr. F. J. Horn, a San Francisco liquor merchant. Last week Mr. Horn was crossing from one blind to another, when, so he claims, some person on the Gun Club grounds took a shot at him. This incident disturbed Mr. Horn's serenity to such an extent that, shortly afterwards, upon meeting Dr. L. F. Cranz, a member of the club, at the railway station, he whanged that gentleman over the head with a walking-stick and subsequently was fined $50 by an unsympathetic justice of the peace. Both the club and Mr. Horn have decided to have their respective holdings surveyed and to preserve a strict neutrality, at least until the result of the survey is known.

CHICAGO AND THE WEST.

Another Reason.

Bearing upon the American complaisance in regard to the destruction of that wild game which is one of the great heritages of this people and the very one most difficult to replace, I may cite yet another reason why there are some things in this country of which we need not be proud. Here is a letter written to a Michigan sportsman by another Michigan sportsman:

"The inclosed clipping is from the Mt. Clemens Leader of Nov. 24. Wm. Sunderlin is a rubber in a bath house in Mt. Clemens, and his wife a cook. These two people make a business every fall of going North the 20th of October and staying until about the close of the season, getting all the birds they can. Then they have their photographs taken with their birds strung on a pole, and have the cut put in the Cutter's Guide. If you will write to F. R. Eastman and ask him to send you one copy each year of the Cutters' Guide with these cuts showing, you will then form an idea of the amount of birds which these people destroy. I say destroy, because last year, when they strung them on the pole to carry them to the protographer's office, the wings and legs actually dropped off the pole they were carrying them on, the birds were so rotten. I take Forest and Stream, and read the reports of the 'Saginaw Crowd' and enjoy them very much. That is why I take the liberty of writing this letter to you. I know you will be interested in what I say, as every sportsman should be. I had intended sending this clipping to our next Legislature, but I am satisfied you could put it in better shape and that it would have a better effect. What would you think of a law which would forbid any man or woman having in possession at one time more than 50 partridges or quail, or 50 birds of either kind, and not more than 100 birds in a season, either quail or partridges? It is a great mistake that all States do not take up Forest and Stream's platform, of 'No sale of game.' We have market hunters here. They go out in naphtha launches at night with a big headlight and slaughter the ducks. The ducks will not stand being shot after going to roost. You can pound them as much as you please in the hours set by law, but not after they go to roost. We have a game warden here, but it is a case of $1,000 a year to do nothing. I have told him repeatedly about this, but it does no good. A political job, don't you know. I have a cottage at the lake and can hear them shooting ducks until I go to sleep. We sportsmen have got to get a move on us or the game hog will wipe out everything."

The name of Mr. Sunderlin is not a new one in these columns. The Forest and Stream a year or two ago printed a story in regard to this man and his doings quite similar to that given above. The photograph showed many rows of grouse hung up for the purpose of photographing, and it was stated at that time that the work of the photographer was nearly intolerable by reason of the odor from the decomposed birds. Just why Michigan will tolerate such doings is something difficult to understand.

The Quail Season.

The quail season is over in Minnesota and Michigan, and has not yet opened in Wisconsin, owing to the close term there. It will presently be over in Illinois, and it has been over all the year in Indiana, so far as most of the Chicago shooters are concerned, the non-resident license law barring out a great many men who formerly shot birds in Indiana. A good many of our sportsmen have been going after quail and grouse in the State of Michigan. It is their custom to bring their birds home with them in spite of the Michigan law.

As to the State of Illinois, inquiry and investigation in good neighborhoods lead me to believe that the reports regarding scarcity of quail in this State have been well founded. Some of my friends have pooh-poohed the idea that quail are influenced by wet or dry seasons. I am personally convinced that they are as subject to drowning out as the prairie chicken, and I base this upon investigation of a wide strip of country in the southern part of the State this fall. As everyone in this part of the world knows, we had an unusually wet spring and summer. I have seen miles of bottom land covered with weeds and corn, ideal grounds for the feeding and breeding of quail, grounds with timber close at hand and all kinds of hedges and brush patches adjacent, which this fall show almost no quail whatever, although last year, the year before and for many years preceding the quail were very numerous indeed in that very locality. In Christian County, formerly as good a quail country as we had in Illinois, the water still stands where for months at a time it stood in the overflows, due to the heavy rains of last spring. I know personally that there was a fine breeding head of quail left in that country last fall. There were not as many quail at the beginning of this season as there seemed to be left at the end of last season. Increase is hardly apparent at all. A good many coveys are put up which experienced hunters declare to consist of old birds exclusively. Again, there are some young birds, showing extremely late breeding, perhaps after the high waters had to some extent subsided. I am entirely disposed to believe with these shooters directly on the ground that the Bob White quail not only may be, but is largely affected in its breeding operations by continued wet weather. Perhaps the quail may have sense enough to breed on a spot above the actual overflows, but the heavy rains would seem naturally to be well-nigh as fatal to the tiny little Bob Whites, naked and not larger than a bumble bee, as with the young of domestic poultry, which any good farm wife knows will perish in scores when subjected even to one heavy summer rain.

A Quail Shoot in Illinois.

Believing it to be part of the duty of any American citizen to vote at least once in every election, and to go shooting at least once in every shooting season, I this week left town and spent a day or so with my friend, Warren Powel, in Christian County. Mr. Powel began to apologize about the birds almost before we started out shooting at all, but it not being a part of the programme to kill all the birds in the county, we got along nicely in spite of the fact that we did not find so much game as we formerly did in his country.

Our old friend Dolly, Mr. Powel's hunting dog, proved herself as good a judge of quail as ever before. Dolly, broad and portly from lack of use, is just beginning to show the touch of advancing years, and she makes her head save her heels upon occasion and her nose save both. I have never seen a better nose on any dog than that carried by this same wise-headed individual. Mr. Powel and I took Dolly one afternoon and walked out a little way from his house. We put up five bevies in all, one in very heavy scrub oak, and three others on one stubble field just about dusk. On the whole, we counted ourselves very fortunate in picking up an even dozen of nice birds. We did our best work on one bevy which we marked down on a grassy hillside. For a few brief moments we really thought we were pretty hot quail shooters, since we let nothing get away. Then we went over into the aforesaid scrub oak, put up a bevy of big, strong birds, and got a practical lesson in humility. We did not bag a single bird out of these, and indeed had only one shot, fired to no effect at the wild bevy rise on the leaves. These quail simply vanished, disappeared, evaporated! We knew perfectly well that a better single bird dog did not exist than Dolly, but we found only two or three birds out of the entire bevy, and these were very wild. We looked carefully into the trees, believing that most of the unaccounted for were hid in the scrub oak; but as it was growing dark, we could not locate them, and finally gave it up.

Bob White is certainly getting to be a more difficult proposition ever year. I perfectly agree with a chance acquaintance, whom I met in Minnesota, who said that he thought the quail was the most resourceful of all our game birds. We are in the habit of thinking that the ruffed grouse is wiser than the quail, but such is not really the case. Suppose you put up a covey of fifteen grouse, would you not be apt to get easily four or five before you got done with the singles? Yet the man who at this season of the year bags four or five birds to the bevy of quail, is doing very good work with head, gun and dog. The birds fly to timber whenever they get a chance, and when in cover of that kind they are hard to pick up.

Our three bevies on the stubble field we found when it was so dark we could hardly see Dolly while she was pointing. We should not have cared to disturb the birds so late, but had to cross this field on our way home. Stooping down to see more clearly against the sky, we did get four shots at the first bevy, and somewhat to our own surprise picked up three birds. A little later Dolly pointed yet another bird in the dark, sprang, and caught a single, which seemed to be disabled and crippled from our own or some other gun.

Grand Jubilee.

On the day following this Mr. Powel planned a grand quail and 'coon jubilee. We were to go out 10 miles to a little cross-roads known as Vanderville, near what was thought to be a good quail country. With us were Estill Harner and his dog Rock, both old

friends of mine in that country, and Frank Taylor, who keeps the village barber shop under the spreading chestnut tree. Mr. Taylor is the owner of a meat dog known as Dan, and as we had along Dolly also, we certainly had no reason to complain of our rolling stock. We reached our hunting grounds a little after noon and started out from Vanderville on foot. During the afternoon we put up quite a lot of quail here, there and everywhere, mostly in the woods and thickets. Between us we gathered up 30 birds, but Mr. Powel was responsible for our not getting a good many more. His innate kindness and dislike to offend once in a while makes him a victim. In this case he met a solitary hunter who was out trying to shoot quail without any dog and without any experience. He seemed to gravitate in toward our party, and in order to save the lives of the rest of us Mr. Powel took him in tow and wandered around all the rest of the afternoon. Hence he got only two or three birds to his own gun, thereby cutting down our bag to lighter proportions than it should have shown. He explained later that he was so busy most of the time dodging around trees, to keep from getting shot by his new friend, that he didn't have time to do any quail hunting.

As to the dogs, they behaved beautifully. They are all used to hunting together, have all got noses, and are all perfectly up in every point of the game. I think that in all my experience, North or South, in any kind of company, I never saw three dogs put up a better exhibition of field work. They were perfectly independent of each other, all good rangers, and everyone of them had good bird sense. They seemed always to know where to go and what to do. A keener nose than Rock showed would be a matter of superfluity, a better single bird dog than Dolly never went on four or three legs, and as for Dan, he supplied the only possible deficiency by being a perfect retriever. The other two dogs have not been trained to retrieve, but content themselves with pointing dead birds. It was such a comfort to watch these dogs going about their business so contentedly and methodically that we did not insist so very much upon the shooting part of the game.

To some extent I retrieved the reputation which I lost as a quail shooter in Minnesota; but even so we did not shoot perfectly, the birds being strong and wild, and for the most part in heavy cover. Taylor proved a good quail shot, and Harner was always able to account for over half his birds, which I call excellent shooting. The only possible regret one could feel under such circumstances was that twilight came about three or four hours earlier than ought to have been legally permissible. I imagine that any lover of the nervous, horse-racing whippet known as a field trial winner, would have been disabused of a few notions could he have seen these three level-headed meat dogs follow their vocations on that afternoon. It was a joy forever. I have tried for two or three years to buy this Dan dog from Mr. Taylor, but after seeing them work together, it seemed to me it would be a shame to part them. I would not sell a dog of that kind myself, nor does it seem right to ask any other fellow to. It is all right to sell field trial winners, but meat dogs—never! As to buying Dolly or Rock, methinks there is not money enough in the present unsettled condition of our banking institutions.

A 'Coon Hunt.

I am satisfied that Warren Powel will be the death of me yet, one way or another. He will either kill me laughing or walking. He is the most merciless walker I ever got tangled up with, and he can see no reason why his pedestrian enthusiasm should not extend itself to all mankind. It seemed to Mr. Powel a pretty good thing after walking 15 miles or so in the afternoon, to go out and hunt 'coons the rest of the night. He had a couple of his men come out from town in the evening, bringing a pair of his 'coon dogs, which he values almost more than he does Dolly herself. These were a present from Mr. W. I. Speers, of Byhalia, Miss., and have killed many a fat ring-tail since they came into Mr. Powel's possession. I was not especially hankering after any more walking, but it was impossible to resist Mr. Powel's blandishments in regard to 'coon hunting in general. Accordingly, at about nine or ten o'clock we started out. One cannot do justice to the disappointment Mr. Powel felt when we found that the conditions were so much against us. Without doubt these heavy timbered tracts along the creek bottoms held good store of 'coons. Indeed, we heard of a local hunter who had killed several but a night or two before. The hour was, however, too early for the raccoons to be disporting themselves, and, most disappointing of all, there came a cold north wind and a heavy freeze. Now all men well posted in raccoon lore know well that it takes a moist, warm night for Mr. 'Coon to do his traveling, and that the latter gentleman is most apt to begin his wandering at some hour after midnight. Our dogs opened two or three times, possibly after mink or 'possums. Once they made quite a run, and we were satisfied killed some small animal at the end of it, although we could never tell what it was—surely not rabbit, perhaps mink, 'possum or house cat. It was pleasant music, this deep voice of the hounds, in the silent, frosty woods, and I felt myself enjoying the situation. We were out for three or four hours, and finally gave it up on account of the unfavorable weather conditions; hence, having to record almost the first blank for Mr. Powel's redoubtable 'coon dogs. These latter have a good many pelts to their credit this fall, notably that of one old grandfather 'coon, which weighed 23½ pounds. Mr. Powel and his friend Harner got up at three o'clock one morning, took the dogs and went out for a little festivity, and this big 'coon was the product of their morning devotion to sport. They got a good run nearly every night, and hence felt very much disappointed at the bad success on this particular occasion.

A Night in a Country Store.

After our 'coon hunt we rounded up at our temporary headquarters, which were in a country store located at Vanderville crossroads. The kindly proprietor of this store, Mr. Busby, took care of us the best way he could, and gave us plenty to eat, but he had no beds where we could sleep that night. It seemed a long way to ride into town against the cold north wind, so we concluded to send the teams in and to hunt in toward town on the following morning. That left our four quail shooters, Messrs. Powel, Harner, Taylor and myself, to pass the balance of the night as best we could. We had a big stove in the middle of the long storeroom, and around this stove dogs and men disposed themselves as best they could under the circumstances. Mr. Powel slept on the counter with a sack of flour as a pillow. He describes a sack of flour as most excellent good for such purposes, though a trifle cold. Mr. Harner arranged three boxes of unequal height as his own personal couch, and Mr. Taylor made preparations of a similar nature. I found that a sheet of brown wrapping paper makes an excellent mattress upon occasion. This I spread upon the floor, put a rubber coat on top of it, and with a shooting coat for a pillow, did very nicely, indeed. It was a little cold during the night, and Dolly, good soul, came to share my bed with me. I found that she made even a better pillow than a sack of flour or a shooting coat. We got along very nicely until four o'clock, when Mr. Busby informed us that breakfast would be ready very soon. By break of day we were ready for the road once more, a little bit short of sleep and a little bit long of pedestrian experience, but all of us feeling better than we had any right to feel under the circumstances. As Mr. Powel was due home that morning, and as the quail country was not so good close toward town, the rest of the expedition resolved itself mostly into a steady tramp through the muddy fields or the side of the still muddier road. We put up three bevies of quail en route, one of them on the grounds of a man who ordered us off his place. On the whole, we thought ourselves fortunate to add nine quail to our stock. The dogs still behaved beautifully, the weather was clear, and although the going was heavy, I am sure that our hearts were light and we enjoyed every foot of the way. Some other time we are going out to attack that 'coon who was too fast asleep to entertain us on the evening of our visit to his domain. Perhaps I am getting old; I do not know; at any rate, I can go out and have a good time even if we don't kill a 'coon or more than a dozen birds. Beside that, a visit to the Powel household is medicinal in its nature. It is a comfort to get out of the city and to meet people who are real folks. This not to mention the great Powel store of Things like Mother used to make.

On Pie.

Speaking of eating, what a wonderful thing is the stomach of a sportsman! When we went away from Taylorville early in the morning, we forgot to take any lunch. Mr. Powel sent to a restaurant and got some sandwiches and also four or five pies. That night at our Vanderville bivouac, we ate up all these things, Mr. Powel thinking that pie could not by any possibility hurt anybody. I have no religious scruples against eating a pie or so upon occasion, and am here to bear testimony that pie is perfectly innocuous when taken in connection with a 'coon hunt at midnight. This hunger, which comes from the outdoor air—what a splendid and beautiful thing it is!

Wouldn't Stand for It.

We had only one really unpleasant incident in our Illinois quail shooting, and that arose from the unwillingness of a certain farmer to let us conduct operations with a certain bunch of quail, which we had marked down in his cornfield. Of course, as soon as he told us he didn't allow shooting, we signified our willingness to go on our way, but as quickly as we turned to go this individual seemed to think that his occasion had come to show authority and masterfulness.

"You'd better go right on out," said he.

"We're going out," said we.

"Well, you'd better go on," said he.

"We are," was our rejoinder. We also tried to explain matters, saying that we did not intend to shoot against his will, and that we never did such things; but the more we tried to treat this fellow like a gentleman the more he acted like anything else. At length Mr. Powel said to him: "My friend, how far does your jurisdiction extend, anyhow?"

"Never you mind," was the reply. "I'm just as good as you are, if I haven't got on store clothes." We wondered a little bit at this, but about an hour or so after Mr. Powel's face lightened up. "I've got it," said he. "When I asked that fellow about his jurisdiction he thought I was calling him some kind of a name or other. You mind, after this 'jurisdiction' don't go. Just ask him where his land runs to, and let it go at that."

The Sultan Called a Halt.

When I was out in Minnesota a week or so ago I met one of the well-known political characters of that State, Hon. Thomas Dowling, member of the Legislature, formerly speaker of the House in Minnesota, at one time secretary of the National Republican League, and in very many ways a prominent man in the Western political world. Mr. Dowling, it may be remembered, was sent as a special commissioner to our Oriental possessions by the late President McKinley, and, among other things, was instructed to visit the Sultan of Sulu and to report upon matters as he found them at the court of that functionary.

To look at Mr. Dowling one would not know that he was a badly crippled man. The truth, however, is that when he was a boy, a farmhand working on a ranch, he was caught out in one of the terrible blizzards which constituted one of the dangers of the Western pioneer, and was so badly frozen that he lost both of his legs below the knees, one of his arms below the elbow, and all but the stumps of his fingers and thumb on the other hand. In form Mr. Dowling is well-nigh gigantic, and mentally is equally well endowed by nature, yet one would think that this misfortune, coming upon a young man, would either have killed him or utterly wiped out all hope and enterprise in his soul. This was not the case with Mr. Dowling. He says to-day that his misfortune was the making of him. He at once began to study to get himself a good education, and worked up from one line of business to another until he has come to be one of the most prominent men, not only in his community, but in his State. Clear-headed, kindly of soul, unsoured by his misfortune, he is one of the best examples of what clear grit will do for the American man.

Above all things Mr. Dowling is a keen sportsman, and about a year ago was so lucky as to kill his moose up in Minnesota. He can walk perfectly well on smooth going, but is obliged to hunt on horseback in the woods. He killed his moose from horseback, one of the few instances of this kind, perhaps, ever to be chronicled. I should not write thus freely of him did he retain any sensitiveness as to his own disfigurement. Upon the contrary of this, he discusses it freely and relates many humorous incidents in connection with it.

One night, when in a sleeping car, he followed his usual custom of removing his trousers, with his feet and boots attached, and hung them over the edge of the upper berth in the sleping car. He left instructions with the porter that he should be called for at a certain station. The porter in the morning, on parting the curtains, saw what he supposed to be the form of his client sitting on the edge of the berth with his legs hanging over and all dressed for rising. As a matter of fact, Mr. Dowling was still sound asleep. The porter did not call him, and he was carried past his station. The matter was reported to the conductor, who called up the astonished and terrified negro.

"'Deed, boss," said the latter, "I went into dat man's bu'th to call him at the place where he was to git off, and I swar to God, he was sittin' up there all dressed with his feet hangin' over the bu'th. I didn't see no use a wakin' up a man what was a'ready woke up. You can't blame me. They ain't nuthin' in the rules says I got to wake up a man what's a'ready up and dressed." To this day the porter cannot understand how his man could be both asleep and awake at the same time.

But in regard to the Sultan of Sulu. Mr. Dowling duly visited the court of the sultan and discharged his duties conscientiously, as is his wont. He thought it might be well to inquire into the domestic relations of the august monarch, and stated that it would give him much pleasure to visit the harem of the sultan. But the sultan drew the line at this, stating that the harem was a private institution pure and simple, and that no human being, not even Uncle Sam, had ever been admitted to its precincts save himself. During this conversation Mr. Dowling and the sultan were sitting comfortably on the floor, after the fashion of that country. It was warm, and both residents and non-residents participating in the conversation, were clad lightly as befitted the temperature then prevailing.

"It is a little warm, I find," said Mr. Dowling, finally, to the sultan through his interpreter, "and if you don't mind, I'll just cool off a little bit." So saying, he reached down to his ankle and unscrewed one of his legs, which he calmly laid on the floor in front of the sultan. The latter was astonished but game, and although he was evidently scared, managed to keep his face straight. Mr. Dowling also kept his countenance unmoved, and presently remarked that he found the heat still quite depressing, and that, if the sultan didn't mind, he would still further disencumber himself. Whereupon he unscrewed the other leg and laid that also on the floor in front of the sultan. The old man got a little nervous at that and shifted his seat, but was unable to keep his eyes away from these *disjecta membra* before him. Seeing this, Mr. Dowling reached around and unscrewed his arm, which he also placed upon the floor. That settled it. The sultan threw up both hands in horror.

"Hitherto," said he, "I have lived somewhat in seclusion in this empire of mine. I admit that I have not become fully acquainted with the customs of American civilization as you represent them to me. It will not be necessary for you to take yourself apart further. I you want to go into the harem, very well. The place is at your disposal."

This is the tale as it was told to me, between St. Paul and Norwood, upon the Milwaukee and St. Paul Road, upon a certain evening in November. Verily, the world of sportsmanship is wide and not without a varied interest.

From New Brunswick.

Mr. Chas. K. Palmer, of Fredericton, N. B., is this week making his second visit to Chicago, and paid the FOREST AND STREAM office a pleasant call. Mr. Palmer was here with the New Brunswick guides at the sportsmen's show winter before last.

Weasels and Ermine.

In the woods it is a weasel, but in the city it is an ermine, and there is a difference. Last winter up in New Brunswick Charlie Cremin gave to a Certain Person a bunch of six weasel skins, saying that they would only net him perhaps ten or fifteen cents apiece at the fur buyers. This winter the Certain Person suggested to me that these skins—they were "ermine" by the time they got to Chicago—would make an excellent collar for an opera wrap, and that as we had such a good start on such wrap, it might be well to finish it, since it would probably not cost more than $300 or $400 or so. In the course of operations it came out that a Certain Person was shy one or two of these black-tail tips, which are supposed to go with ermine when it moveth itself aright. "Go buy a tip," said I "go buy a couple of dozen of them." I was figuring on the New Brunswick basis. It is different here. Charlie Cremin gets fifteen cents for a whole weasel skin. The fur dealer here gets just sixty-five cents for the end of that weasel's tail. This goes a little easier when you call it "ermine."

Turning Southward.

CHICAGO, Ill., Dec. 10.—At this season the thoughts of a great many sportsmen are beginning to turn

southward. Our shooting is nearly over now in this part of the world, and, indeed, it would be very well, in view of the scarcity of quail in Illinois and Indiana, were the shooting to end at this date. We would not have any too many birds to stock us for next year even did we stop shooting now, if we were to catch a second bad season next year, though that is not likely. The more abundant and more regularly supplied covers of the Southern States naturally appeal to the Northern shooter, who has leisure for a trip into that country. The sportsmen of Saginaw earlier mentioned as having procured a large quail preserve in Mississippi, will possibly get together some time within the next thirty days and visit their new hunting grounds with a view to putting up a club house, etc.

Mr. Ernest McGaffey and a party of four or five others of Chicago have returned from a trip to the timbered country of Arkansas, where they hunted on a tract owned by the Paepcke Lumber Co. of more than 100,000 acres in extent, all wild country. Among other results were two big wildcats, four deer, five wild turkeys, an assortment of raccoons, etc., the hounds which were taken in, proving industrious in their way. Mr. McGaffey reports a very enjoyable time.

Southern Migration of Squirrels.

Col. R. E. Bobo, of Mississippi, who is again in Chicago, tells me that this fall there came in across upper Mississippi a great migration of gray squirrels. These came from somewhere to the northwest, without doubt from Arkansas, and hence must have crossed the Mississippi River. At last accounts they were still tarrying in the Yazoo and Sunflower country, where the mast is good. These great migrations of squirrels are among the interesting phenomena of nature, and can to-day be, perhaps, better noted in the South than elsewhere. It has been reported in FOREST AND STREAM that such a migration a few years ago started in eastern Tennessee and wound up in New Hampshire. Bobo tells me that sometimes the squirrels entirely leave his country, and again are very numerous. He has on four different occasions seen these migrations crossing large rivers, twice, I believe, the Mississippi River. He says this fall the squirrels crossed while the water was yet fairly warm, but has seen winter migrations when long submersion in the icy water left the squirrels almost utterly exhausted when they emerged from the water. He says that in these cases the squirrels simply crawl out on the bank or sand bar and lie there, nearly perishing, until they gradually become dry. He has seen persons go along and pick them up by the tail, throwing them into sacks in any quantity desired, and has seen parties go out in boats to meet the swimming hordes, picking the squirrels up by the tails and throwing them into baskets or bags in the boat.

Bobo and the Bear Hunt.

It is late now to speak of President Roosevelt's bear hunt in Mississippi, but in view of certain inaccurate statements which have appeared in different parts of the country, Bobo wishes to be set right before the sportsmen, and is anxious that the FOREST AND STREAM shall have what will perhaps be the only accurate statement of the matter published. There was just a little politics, after all, in the Mississippi hunt, which was not really organized under the advices of Governor Longino after all. As to this, however, we need not concern ourselves. A paper in Memphis printed the somewhat astonishing announcement that Col. Bobo had declined to enter the hunt at Smedes, and assigned an unworthy reason for this action. This story stirred up the hospitable Colonel's ire to the last degree, and he promptly came out with a card, which was printed in different Southern papers, stating that he claimed to be both patriot and gentleman and had no part in the awkward and uncouth attack made upon the President of the United States at the expense of himself. Col. Bobo printed the following card: "Mr. Stuyvesant Fish wired Capt. A. A. Sharp to ask me to join the President's party. When I got the message I had been five days in the woods, hunting with personal friends from Champaign, Ill. I regretted more than words can express that I could not see any honorable way to comply with Mr. Fish's request, and I so wrote him. I should have been delighted to join the President's friends and to aid in extending him every courtesy, which would be due not only the man but his exalted office. The President of the United States is never slighted by any true American, and anything published to the contrary as coming from me, no matter by whom related, is so related under total misapprehension and in error. (Signed) R. E. Bobo."

There is no special moral and no reflection intended in this somewhat delayed statement, except that the next time the President wants a bear hunt, it is to be hoped he will go to Bobo direct. The Bobo bear pack is by comparison the only one in the State of Mississippi. It is a pleasure to see it when it moveth itself aright on its accustomed grounds; and when Bobo goes out after bear, he gets bear.

Western Men in New Brunswick.

I have already mentioned two or three Western men who were successful in New Brunswick. To these there is to be added Mr. George Henneberry, of Chicago, who was out with Adam Moore this fall on a successful trip, and who has the unqualified admiration of his guide, as witness a letter just received from Uncle Adam to-day. Adam says: "We have had a very successful season. I have never known big bull moose so plenty. We got some very fine ones and were never more than a week in getting any man his moose. Until November there was no snow. On the 12th it snowed, and then we saw a good bull every day for four days, while the snow lasted. That new country we discovered last winter and which I opened up this season is a dandy. That's where Mr. Robinson, of Chicago, got his moose."

Mr. M. Westover, of Schenectady, N. Y., was another one of Adam's customers this fall, and takes pains to write me under date of Dec. 8, saying that he had a most enjoyable fortnight with Adam. He met him at Perth and they drove to Riley Brook that night, went on to the forks of the Tobique the next morning, and on the second day's walk thence arrived at Nictor Lake. Mr. Westover interviewed seven different bull moose, let go one at which he might have shot, but shot his moose and caribou, although waiting for a long time to pick out a good moose head. Something of my own experience comes back as I read the following sentence. "I am sorry I killed the moose, but we followed two bulls for several hours, and when we came up with them it was so thick we could not see much, and Adam judged much more by size and color than by sight of the horns. I shot each animal but once, using the new .50-110 cartridge."

Changed Habits in Game Birds.

Speaking of Minnesota quail, my friend, Mr. Mershon, of Michigan, a close observer, writes thus:

"It is strange how the habits of these birds have changed. Northern Michigan is full of them, and instead of being an open field bird, they seem to frequent dense thickets. Their habits are more like those of the ruffed grouse. It seems to me they have become larger and hardier, and they are wilder, flying further after they are flushed, and being an entirely different bird than that which we knew here in southern Michigan twenty years ago. In fact, Saginaw was the extreme northern limit for a long while. In those days these birds were winter killed so often that it was only once in four or five years we had decent shooting. At times we would think they had entirely disappeared. Now we find them all around Wingleton, in Lake County. I saw lots of them north of Tawas this fall, and hear of them all over the State."

I can say that my own experience bears out these observations on the habits of the Bob White quail. These birds, as I saw them in Minnesota, were an entirely different game bird from the quail of my earlier years in Iowa, Kansas, Nebraska and other parts of the West and South. I believe that in these northern regions they surpass the ruffed grouse in shrewdness, shiftiness and general ability to care for themselves, and I believe that they in time become almost as hardy and as able to endure the northern winters, and will show fewer of those general and mysterious disappearances which sometimes turn up in regard to the ruffed grouse supply.

Heavy Seizure of Nebraska Quail.

Dec. 13.—A shipment of 500 quail, packed in barrels with layers of poultry on top, was seized at Fremont, Neb., by State Game Warden George L. Carter on Dec. 12. The shipment came from Verdigris, Neb., and was billed to Chicago. The name of the consignor is thought to be known to the State Game Warden and the impression is that arrest and conviction will follow. This is the most important seizure of game reported from Nebraska for a long time, and the sentiment regarding it would seem to be one of mild surprise. There is no question that large quantities of game are shipped out of Nebraska regularly to the Chicago market.

Found Dead in the Woods.

The body of Nelson Fordham, a merchant of Virginia, Minn., was discovered in the woods of a part of the Mesabe range a week or so ago. This was at a point some ten miles from the railroad. Fordham had been shot through the body by some unknown party and the probability is that he was another one of the victims of the deer-hunting season. No clew whatever to the shooter was discovered. Fordham's own rifle lay beside him and showed no sign of having been discharged.

The Quail Season.

The Illinois quail season is tapering off now very rapidly and few of the Chicago boys are now going out, owing to the bad reports brought in by shooters regarding the scarcity of birds. No one has been having very heavy shooting, although it is not to be said that the head of game is cut down to a point warranting any special alarm. Granted a good winter and spring, we should have a fair supply of quail next year, at least let us so hope.

Mr. Oswald Von Lengerke was down at Marion, Ill., in a very good quail country, a few days ago, but did not have any very heavy sport, although on one day he got 28 birds. He reports great quantities of rabbits, with which, of course, he was not interested. Here is a tip for some one who likes fun with beagles.

At Tolleston.

Mr. C. S. Dennis took a few friends to-day for an afternoon at Tolleston Club, south of Chicago. There seems to be no legal reason why they should not shoot a few blue rocks or pattern their shotguns on the barn door if they feel so disposed. There is talk of a quail preserve to be established by the Tolleston Club, that is to say, if there can be any such thing as a quail preserve for a club of any great extent and for a country so near to the gun bearing population of the lower Chicago precincts.

Mayor Goes to Oklahoma.

Mayor Harrison, of Chicago, went as the guest of honor in a special car party which will take a trip in Oklahoma this week with a view to a little quail shooting. Different chiefs of the Indian Nations have sent the Mayor invitations, the story having gone abroad that the latter is a member of the tribe of Wishininne, and hence qualified to shoot in all the Indian territories.

HARTFORD BUILDING, Chicago, Ill.

Few Ohio Woodcock.

MIAMISBURG, O., Dec. 10.—*Editor Forest and Stream:* Woodcock are becoming very scarce in this section of Ohio and are seen only at rare intervals. C. V.

"I think I know," said the amateur gunner, after his fifth straight miss, "why those birds are called 'ducks.'" "What's that, sir?" inquired the guide. "Because they duck out of the way every time a fellow shoots."—Philadelphia Press.

A Warrant to Arrest Your Attention.

Every week for years I have read with much interest the columns of FOREST AND STREAM, and at last I feel it almost my duty to write a few lines concerning the dedecrease of our wild fowl.

I have read the fine work of Mr. George B. Grinnell, "American Duck Shooting," and heartily agree with him in his suggested methods of stopping, to some extent, the decrease, namely: Limit the bag for the day and also for the season, and stop spring shooting. I have made a study of the game laws of the several States where the famous ducking grounds are located and find that ducks can, practically, be killed whenever seen; as the close season is the time the ducks are north breeding. You will readily see by consulting the laws and with a knowledge, born in all men, of the arrival and departure of the fowl, that in the matter of season, ducks are afforded very little protection, except perhaps on the flats around Perryville and Havre de Grace, where the laws are more binding than in other localities.

During my short existence, I have noticed a very marked and sad decrease in the hosts of fowl as they come down each fall, and although my observations have been confined to one locality, principally the Delaware River, around Marcus Hook, Wilmington, Billingsport and Essington, I have noted the decrease from time to time, and it only seems a question of a few years before they say good-bye forever.

In "American Duck Shooting," I see an article which describes the shooting on the Delaware River, some years ago, between Marcus Hook, Pa., and Pennsville, N. J., and I note with appreciation the shame of the shooter, after a day of slaughter among the mallards. But such examples as this one are very rare; usually the shooter simply shoots until either his ammunition is exhausted or the flight of fowl ceases. I fail to see any sportsmanlike qualities in such gunning, and I think the sportsmen will agree with me in the belief that the sooner such men as these are out of the way, the better duck shooting will become.

I believe that by the time another generation has grown to manhood, the accounts of duck shooting will be told, much as are the thrilling accounts of hunting the bison to-day. While in Charleston, at the exposition, last winter, W. F. Cody (Buffalo Bill) informed a reporter of one of the local newspapers that in the early seventies he (Cody) had killed five thousand buffalo in eighteen months. While this is a little out of line with the text of my article, it serves to illustrate how quickly game can be exterminated, when so slaughtered, as recited above.

Let all interested write to their representatives in the Legislature and recommend a course that will protect these beautiful as well as gamy birds from the certain destruction which now confronts them.

ALBERT M. BARNES.

Which?

I HAD some sportsmen friends whose enthusiasm for shooting and fishing impressed me so deeply that I, who had known nothing of sport, became imbued with their spirit, and finally, as a raw novice, joined their ranks. I spent much money in obtaining a shooting and fishing outfit. For many years I took two to three weeks' time to indulge my passion for use of rod and reel, dog and gun. For many years I returned empty-handed. I furnished subjects for my friends' merriment. I was pointed out as the original man, well garbed, well equipped with the finest of rods and reels, who purchased his fish of the country tatterdemalion with a "pole," clothesline, pin hook and earth worm. I was also the original hero of the episode in which the dude man with a dude dog and dude gun buys his game in the market after a return from a shooting trip, and a few moments before his advent within the bosom of his family. I was pleasantly referred to as a "duffer," a "lobster" and other terms of endearment, which pass between friends when they esteem each other so highly that they can safely say unkind things. I was no good. I was simply so inefficient that I was a laughing stock. Why? It was not necessary to kill anything to have true sport. Why then was I such an object of general ridicule?

I got past the unskillful stage in time. I return now with good bags, the product of knowledge and skill acquired by application, weeks of practice, the expenditure of much money and the suffering of much mortification from the contempt of my friends. But, strange to relate, I am now a game hog. I was an object of contempt, because I couldn't bag any game, and now I am a still greater object of contempt because I can and do kill something.

If one listens to all the censure and heeds all the whims of others, what would one do? Nothing.

J. H. BLACK.

Forestry for Farmers.

WASHINGTON, D. C., Dec. 10.—The farmers of this country own about 500,000,000 acres of woodland, ten times the acreage of all the Federal forest reserves. Most of it consists of small wood-lots from which the owners derive their timber supplies for farm purposes.

It was to help the farmer in caring for his timberland that the Bureau of Forestry several years ago undertook to furnish him, without cost, with the services of its foresters. The offer proved popular, and applications for assistance have far exceeded the ability of the Bureau, with its limited number of trained foresters, to answer them. During the season just passed the Bureau has accomplished more than ever before in putting small woodlots under forest management and in teaching the farmer how properly to treat his timber. Two experts have been employed in the North and South who have examined and have put under management several thousand acres of woodland.

A great deal of wood is consumed every year on the farm for fuel, posts, poles, and other uses. Ordinarily, the farmer cuts what he needs without thought as to whether he is lessening the power of his forest constantly to yield its supplies. The result is that the forest becomes

poorer every year and less able to furnish the wood its owner needs. The skill the farmer exercises in the management of his crops is not of the kind that enables him to manage properly his timber. He needs the services of a forester.

Usually, only one visit to the farm by the Bureau's expert is necessary, and this service is given without cost to the owner. When, as occasionally happens, a second visit is needed, the owner is required to pay the traveling and living expenses of the expert while employed at the work.

Game Refuges.

ROCHESTER, N. Y., Dec. 8.—*Editor Forest and Stream:* Your reference to "Massachusetts Game Refuges" in your issue of Dec. 6, calls to my mind what seems to me a most excellent suggestion to be adopted by the State of New York. Sometime ago I wrote a note on this subject, but finally cast it into the waste basket. My suggestion would be that the State establish in different localities, and especially about the sources of our streams, a number of parks as game and fish refuges. In these parks there should be neither fishing or hunting. Of course they should be in the charge of a keeper who, let us hope, might be something besides a man with a political pull, and who might retain his charge so long as he performed his duties faithfully and honestly.

The State could purchase or acquire at a small cost comparatively, sufficient land in different localities to establish such parks, and they would not only protect the sources of our water supply and streams, but assure us game and fish that would migrate therefrom and thus furnish a lasting supply of both, to some extent at least.

The land necessary for these parks or refuges would necessarily be such as is located in the hilly and rougher portion of the State as well as marsh lands. In fact, a very few thousand dollars, if discreetly used, would purchase a large number of acres in different sections of the State.

This to me is a subject that I think every lover of nature and sportsman, would be interested in, and I should be pleased to have their expressions together with yours through the medium of your journal.

If the idea is a favorable one it is not too late to procure the necessary legislation at the coming session of the Legislature. F.

Massachusetts Game.

NORTH BEVERLY, Dec. 9.—*Editor Forest and Stream:* All this fall there has been a great scarcity of ducks in the ponds of this section, and as far as I can learn this applies all over eastern Massachusetts. Geese were a total failure and black ducks at a premium. The only birds that appeared in any numbers were bluebills.

Among a number of odd birds taken at the stand was a canvasback, shot on Nov. 13. This was the first ever taken here to my knowledge.

Longtail ducks were also shot in the pond for the first time, and at the early dates of October 19 to 21.

During the last few days there has been quite a little flight of American mergansers with some splendid male birds. It is a curious fact that the males of this species, and also the male buffleheads and hooded mergansers are very rarely seen here, while the females of all these birds are rather common.

The main duck flight this fall was from about October 10 to 26. The geese were seen in greatest numbers on the 14th, 15th and 16th of November, but on account of exceptionally mild weather, few if any, were secured. Later than this there appeared to be only a stray bunch now and then.

Woodcock were, of course, very scarce. In about nine days' hunting in the towns of Beverly, Danvers, Wenham and Topsfield I started only three. Snipe were practically absent. I saw only two, and other gunners reported about the same. Last year we had a fair number.

Quail were in good numbers for so shot out a locality as this, and ruffed grouse seem to be on a steady increase. It is only to be hoped that they will continue to have the chance to do so. J. C. PHILLIPS.

Massachusetts Deer.

WILLIAMSTOWN, Mass., Dec. 10.—*Editor Forest and Stream:* Last Sunday, Dec. 7, two companions and myself saw three deer in Williamstown, Mass. They were a doe and two fawns, and had come to the edge of a wooded hill, about a mile from the town, to eat some late apples which still clung to the tree.

Ten years ago deer were about as common in Williamstown as elephants, and one might walk the hills all winter and never see a track. Now, however, they are seen quite commonly, and just across the Vermont line several are killed every year.

The notable increase is interesting as a commentary on the good laws of Vermont and Massachusetts, which I hope may long remain on the statute books. The wardens, too, deserve credit for enforcing the laws.

DAVID E. WHEELER.

The Sportsmen's Show.

THE ninth annual Sportsmen's Show, held under the auspices of the National Sportsmen's Association, will open at Madison Square Garden, New York City, Saturday, Feb. 21, 1903, and continue until Saturday, March 7.

One of the features will be many reputable and competent guides from hunting and fishing sections, never before represented.

Fly-casting, rifle and revolver contests—never failing sources of interest to the general public, as well as to sportsmen—will be held under the management of those well qualified to conduct such contests.

Trade exhibits, excepting launches, marine engines and motors, will occupy space on the gallery. Launches, marine engines and motors will occupy space on the main floor.

J. A. H. DRESSEL,
General Manager.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

West Virginia Skunk Protection.

MORGANTOWN, W. Va., Dec. 10.—*Editor Forest and Stream:* Under the provisions of a recent law, whenever two hundred citizens sign a petition requesting it, the law is put in force, in the county in which such petition is signed, prohibiting the killing of skunks. Six or eight counties in the State have put this law into effect.

EMERSON CARNEY.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The Mahseer.

NO FAMILY of fishes has a better claim to noble rank than the *Cyprinidæ*. From remote ages the carp has been associated with man in the Far East, where it has lived a gentle and civilized life in fish ponds, esthetically surrounded by stone lanterns, dwarf pine trees, porcelain bridges, and lotus blossoms. Migrating from Central Asia with the Aryan race, this ancient family planted scions in Europe, and their descendants swarm there at the present day, especially in the fish preserves of Germany and Austria. Among them there must be carps of long pedigree, whose ancestors were, perhaps, favorites of some early Chinese emperor.

Centuries of culture seem to have developed the intelligence and special senses of the carp. Its alertness and the cunning it displays in avoiding the sweep of a net have not escaped observation. Fish in general are supposed to be deaf, or, at any rate, somewhat hard of hearing; but there is no doubt that the tame carp knows and answers a call to feed. Owing to its being regularly fed in ponds, it has lost the habit of hunting small fry; and the carp is, therefore, reckoned among the least predatory of fishes. Izaak Walton pays tribute to the fineness of its breeding, its quality, when he speaks of the carp as the "queen of rivers; a stately, a good, and a very subtle fish."

Yet, in spite of this praise, the carp in modern England, where it is more common than in this country, is not highly esteemed by sportsmen. It herds with roach, dace, and other "coarse" fish—as they are called—in muddy, silent streams, or grows fat and sluggish in a placid pond, where it is angled for with float and worm. It is not a lively, sporting fish; that is the head and front of its offending. English fly-fishers, who know little of the bass family, are apt to look on the *Salmonidæ* as the only game fish in existence.

The British angler exiled in India has discovered, however, that he is dependent upon the *Cyprinidæ* for sport. They are distributed throughout that continent from the Vale of Kashmir, across the northern border, to the Carnatic district in the extreme south. They are found in the swift streams of the Doon as well as in the lakes of the foot-hills and the quiet pools of the great Jumna. The mahseer, as the Indian carp is usually called, is a sporting fish, but its disposition varies with the nature of its habitat. Trout lose their gaminess in sluggish, sun-warmed streams, and the salmon of the forest-shrouded rivers of the Pacific Coast do not rise readily to the fly. There are similar differences in the sporting qualities of the mahseer. If it has to struggle with the cold and rapid waters of a torrent like the Thelum, the fish develops a strength and spirit that makes it the peer of the most pugnacious salmon.

The name "mahseer" comes from the vernacular mahasir and means "big head." The fish is aptly named. Running as it does up to forty or fifty pounds weight, the mahseer is a giant carp, with all the characteristics of the genus *Cyprinus*. It is deep in the shoulder and carries a big dorsal fin on its arched back; two pairs of barbels, those fleshy mustaches from which another member of the family takes its name, droop from the corners of its almost toothless jaws. At the opening of its narrow gullet is placed a large, flat bone, which crushes indifferently hard grains and stout hooks.

Being omnivorous in its feeding the mahseer is taken with various lures. In the Kumaon lakes, a Scotch salmon fly is used, when the water is low and clear; but the fish are generally angled for with molded paste, tinctured with some strong smelling oil, or with some form of spinner. Of these the light, oval, shining brass spoon, no larger than the finger-nail, makes very pretty fishing; it can be cast underhanded and spun near the surface of the water. But where the angling is done from a boat and the mahseer run heavy, one uses a heavy, four-inch silvered flat triangle, which has two of its corners produced and turned up, so that the bait spins round, screw-fashion, on its axis. Another way, and one that may seem strange to the American angler, is to fish with parched peas. These, after a hole has been drilled in them with a needle, are threaded, two or three together, on the shank of a hook and cast, with an underhand action, so as to float on the surface of the stream. The hook, of course, is attached to the line with silkworm gut and, with the light grains, weighs no more than a small salmon fly. Gram fishing, as it is called from the native name for the bait, affords the active angler the same exercise and roving delights as fly-fishing; he can stroll from rapid to rapid, casting as he goes. But mahseer can be taken with "gram" only in rivers where they are accustomed to feed on seeds and grains.

Such a river is the Nerbudda, which, rising in the teak forest of Seoni, where Mowgli lived with his friends, the wolf-cubs, flows through the partly cultivated country to the south of Jubbulpore in Central India. Twelve miles from the city, it flings itself into a deep chasm in the limestone formation at a place called the Marble Rocks. This is the scene of the destruction of the dholes, as narrated in the Jungle Book. The wild dogs, it will be remembered, were lured by Mowgli to the brink of a precipice, over which they plunged to be stung to death or drowned in their attempts to escape from the wild bees. The nests of these formidable insects hang like bunches of grapes from the Marble Rocks, and visitors take every precaution to avoid disturbing them. That their stings have proved fatal to human beings is shown by the inscription on a tombstone close by the chasm. This records how an engineer met with his death "drowned by wild bees in the Nerbudda."

This river is, moreover, one of the sacred streams of Hindostan. There are many temples on its banks, long flights of steps, or ghauts, by which the faithful descend to perform their ablutions or to draw measures of the holy water to take home with them. The worshippers eat their meals on these stairs and cast rice, pulse, and other grains into the river. This attracts the mahseer to the ghauts, where they wax fat in the muddy, sluggish pools below the temples. The fish in the Nerbudda have thus become grain-eaters.

Angling for tame mahseer off the steps of a temple is not sport. Though not forbidden by law, it is contrary to the spirit of British rule, which respects the religious prejudices of the natives. But the fish that live in the pools and rapids below the shrines are just as fond of the peas and other grains as their more favored brethren. Plenty of such food floats down the river; the fish feed on it and may be caught with "gram" bait in the proper season.

The time for fishing depends, like everything else in India from the harvest downward, upon the recurrence of the monsoon. During this period, which lasts from June to September, the rain that falls continually, save for an occasional interval of fine weather, puts an end to angling. The Nerbudda rises, foot by foot, till the brown, tumultuous flood is almost level with the brim of its deep channel. After the monsoon, the waters subside gradually till, by the middle of winter, the broad and deep bed appears a world too wide for the shrunken stream that meanders through its sands. The weather is now set fair, the days cool and pleasant, and the time for mahseer fishing has come.

But you cannot stroll down to the river, rod in hand, as if you were going trouting. The river must be "chummed," or ground-baited, at some particular spot, usually a series of rapids. To perform this service you send out a "syce," or grass-cutter, or some one of the host of servants who swarm round your bungalow. The man must be provided with a liberal allowance of grain, for, by the custom of the country, he will help himself to what he wants and bestow the remainder on the fish. When he has attracted the mahseer by assiduously casting them daily rations, Nathoo, let us call him, returns to say that the "bundobast," or arrangement, is made. He then parches some grains, drills them so as to be ready for the hook, and, with a reserve supply in a bag by his side, follows the angler to the river.

At its cold weather level the Nerbudda flows at the bottom of a deep trench formed by rocky or sandy cliffs of no great height. The panther has his lair in the strong, jungle-covered hills that abut on the river; though rarely seen, his howling cry is sometimes heard at nightfall. The stream does not fill its bed, but winds from side to side over pebbly flats and past sandy islets, covered with grass and low bushes, in which the gaudy plumage of the wild peacock is sometimes seen to flash. This is the scene of your sport and, if Nathoo has done his "chumming" thoroughly, the water will seem alive with fish, when he throws a double handful of grain into the bubbling rapid, to bring the mahseer to the surface. As the gram touches the water, there is an instant commotion and a sound like the smacking of many cart whips. Not a nose is seen above the waves, but the floating grains are sucked under. Then you swing the line out from your cane rod and let the baited hook float down the current over the feeding fish. The first sign of a rise is given by the whir of the reel, for the mahseer usually hooks himself. All the fighting power of the big carp is expended in the first rush. If well hooked, and the leathery mouth holds the hook well, the mahseer may then be reeled in, resisting more or less according to his weight. On the Nerbudda a fish of five or six pounds is a good one and, played in a swirling rapid, a fat, olive-green, ruddy-finned mahseer affords excellent sport. Smaller fish abound in the litle streams that join the main river.

Fishing in these waters, with fine gut and but one grain on his hook, the exile may almost cheat himself into the belief that he is fishing for trout. He drops his bait under sparkling cascades into amber pools. The living productions of nature in India, all that covers the surface of the land with shade and herbage, is strange and unfamiliar, but in the primitive elements of rock and water he fights the "touch of nature that makes the whole world kin." For granite is granite all the earth over, the rock is shaped and worn away by Eastern streams into the forms familiar from boyhood to the Northern man; and water makes the same music with the pebbles of Nerbudda as with those of Tweel. Pursued in this spirit, his favorite sport charms the angler into forgetfulness of his exile, of the many leagues of "salt, estranging sea," that divide him from the land of his birth.

F. W. REID.

Bass in the Susquehanna and in Cayuga Lake.

SAYRE, Pa.—On the Susquehanna River, a few miles above Owego, some of the finest pike and black bass fishing of the season has lately been enjoyed by local anglers. Some especially large pike have been taken both at the point above named, and on the river between Sayre and Owego. As a matter of fact, the past two months have afforded angling of a most delightful sort on Susquehanna waters. Advices from Cayuga Lake concerning the bass and muscallonge and pickerel fishing sustain and confirm the report above made.

Along the east shore of the lake just off from what is locally known as Esty's Lookout, a large number of bass were taken during October and November, and for this particular reach of water the bass season, for the number and weight of fish taken, must be classed as a record breaker.

"Some New Salmon Flies."

The paper on new salmon flies in our issue of Dec. 13 should have been credited to the London Field, from which journal it was copied.

Game Fishes of Northern California

The anglers of San Francisco are now happy in the conviction that for good sport they will not hereafter have to depend entirely upon trout fishing. A few years ago the scarcity of trout in our coast streams was deeply deplored by the angling fraternity, but striped bass fishing was then in its infancy and salmon fishing was not on the list of sports in our streams. Fortunately the trout fishing has somewhat revived and this year moderately fair sport was had during the early part of the season. To counteract the scarcity of trout, we have excellent bass fishing practically all the year round, also salmon fishing from November to January and the usual run of steelhead trout every winter.

Trout.—For fair trout fishing the angler has only to travel three hours from San Francisco, where one of the most prolific streams, the Paper-mill Creek, is reached. This stream has furnished good fishing for years to a very large number of sportsmen. The Sonoma Creek has also proved itself worthy of notice and Boulder and Bear Creeks, in the Santa Cruz mountains never fail to yield fairly good catches to those familiar with its stretches.

In the early days of California when anglers were few and far between, good sport could be had on any coast stream. Where there were fifty fishermen twenty-five years ago, there are now probably five hundred, hence trout fishing must be a scarce commodity in our midst. Two rivers which yield good sport are worthy of mention, viz., the upper Sacramento and the never-failing Truckee. The upper Sacramento affords good sport from the opening of the season until about June 15, when fly-fishing practically ceases on account of the arrival of the salmon making for their spawning beds. The salmon, however, return to the ocean about the middle of September and fly-fishing is resumed from that date to the close of the season. On the Truckee, fishing is good during the entire season, but is at its best during June and July. This river has its source from Lake Tahoe and empties into Pyramid Lake. The anglers who yearly whip this stream comprise not only California anglers, but sportsmen from all parts of the country, and the same faces are seen year after year at the different fishing points along the line, principally among which are, Truckee, the Union Mills, Boca, Floriston and Verdi. This surely is sufficient proof that for good sport the Truckee River has not its equal in California or probably the United States.

The only difficulty which our city anglers experience in visiting these rivers is a too short vacation, the railroad rates are most liberal during the summer months and within the means of any angler who wishes good sport at a small outlay. The Southern Pacific Railroad Company's lines run parallel with the Sacramento River from Slatonis to Shasta Soda Springs, and on the Truckee River from Truckee to Reno. The railroad employes are very obliging and are always willing to impart their knowledge of the best fishing points. The summer resorts at the best fishing grounds of the upper Sacramento River are Slatonis, Sims, Castle Crags, Shasta Retreat and Shasta Soda Springs.

Bass Fishing.—Although only in its infancy is a boon to the masses and bass are taken in large numbers almost anywhere in the waters of San Francisco Bay, the shores of Belvedere, San Pablo Bay, the sloughs of Petaluma Creek, the long fill, Point Reyes, the Oakland estuary, estuary canal and Lake Merritt, Oakland. The bait thus far known is the clam. During the past two years trolling with a large spoon (Wilson's) has proven a very killing lure.

Bass fishing has become universal and hundreds of fishermen enjoy the sport. Our deep sea fishermen have taken it up, our "Dago" friends with their hand-lines can be found everywhere in search of this game fish. The proper tackle for this sport, is an 8-foot rod, 200 yards of strong line, good substantial reel and a No. 4-0 hook.

Steelhead Trout.—This very game fish may be taken with rod and line during the winter months, in tide water and is found in all streams emptying into the ocean, the best of which is the Russian River, Mendocino County. They loiter in the pools awaiting an opportunity to ascend to their spawning beds and it is at this time that they will take all kinds of lures, but principally a trolling spoon. They run in size from a few pounds to 25 and 30 pounds, and when hooked put up a great fight before being brought to gaff. The tackle used, a 10 ounce rod, 100 yards silk line, a 3-foot leader with one or two double hooks for bait fishing with salmon roe as a lure. For spoon fishing, a 3-foot leader, with red fly on swiveled hook running loose on the line above the leader.

Salmon.—It is only within the past year or two that this species ,the Quinnat salmon, has visited the tide water of the Paper-mill Creek in quest of spawning grounds. The majority taken thus far are monsters in size, but not as game as the steelhead, they, however, make a few good rushes, are swift and strong and the tackle required is similar to that for steelhead. About the first of November they appeared in large numbers at Point Reyes and many of our local anglers went up after them, but the fish would seldom take any of the tempting lures presented to them.

I. B. Kenniff and Sam A. Wells are both very expert in spoon casting and demonstrated to their admiring brother sportsmen that they could cast from the reel a 5B Wilson spoon to any desired spot in the White House Pool. It was even remarked that W. A. Cooper would have to look to his laurels, even though he is recognized as one of the best fishermen from San Francisco.

The salmon were seen moving up stream by twos and fours. During their movements they had spoons thrust upon them from both sides, but they were too wise and failed to take any notice of the flashing metals. However, a few were picked up in the White House Pool and the Narrows, and Messrs. Wells, Banker, Fatjo and Hall were the lucky ones. It was reported that Al. Hall caught one weighing 33 pounds on a No. 6 hook with a white worm as a lure.

Fishing for salmon is an innovation in the Paper-mill Creek and the anglers will soon learn that the tackle must of necessity be of the strongest kind, at the same time it must be light, and the rod should not weigh more than 8 ounces. If the angler endeavors to cast incessantly all day with a heavy rod he soon will have to quit the sport and seek lighter tackle. He must also provide himself with 100 yards of silk line, as the fish are swift and strong, and put up a hard fight before being brought to gaff. The silk line is by far the best, as it runs freely from the reel and enables one to make a much better cast than with the linen lines in use.

We were all very much amused recently at our friend Banker, who was fishing with the butt end of a good-sized sapling, and notwithstanding the weight of his rod, he landed in a couple of minutes a fish that would do credit to a deep sea fisherman, it was a 35 pounder. A novice at angling for salmon whose tackle was of the best, emulated Banker's style of playing his fish and lost two good sized ones which he might have landed had he allowed him a little leeway.

On this occasion Sam A. Wells made the catch of the day, and judging by his efforts and excitement, we thought he had hooked on to a 50-pounder, but it soon developed that the supposed mammoth salmon was nothing more than a large sized northern diver or grebe which had taken the spoon, while it was sinking, in mistake for a fish. Wells landed the diver after a twenty minutes' fight and was vigorously applauded by the assembled fishermen.

RUSSIAN RIVER—STEELHEAD TROUT WATERS.

Fish and Fishing.

Fly-Casting Up or Down the Stream.

Only a day or two ago I listened to a very interesting discussion by two old fishermen upon the relative merits of fishing up and down stream, and though both of the disputants are men well up in the literature of angling, and quoted freely from the authorities in support of their respective views, I could not but observe that only one American author was appealed to in support of the contention that in wading a stream it is better to cast toward its head, although this is the view entertained by the majority of English writers on the subject. Genio C. Scott, who advocates fishing up stream when wading, supports his contention by saying that this method does not roil the water, and that consequently there is less liability to alarm the fish. He admits that when casting from the shore it makes very little difference which way the stream is fished, but fails to make the principal point insisted upon by English advocates of up-stream fishing, namely, that fish resting in the water have their heads pointing up stream and cannot see behind them. The majority of American and Canadian trout fishermen believe in down-stream fishing as a general rule, and rightly so, I believe; though I know of bright, clear, shallow brooks, where the well-educated finny inhabitants can only be successfully tempted from the rear. Sometimes, as Genio Scott has said, the question as to fishing up or down a stream, should be decided by its condition, and the difference between the characteristics of the average English and American trout stream has doubtless had much to do with the different habits of the anglers who fish them. Thaddeus Norris has well pointed out that only in a still pool or where the current is gentle, is one able to fish up stream with any degree of precision, for the force of the current in our rapid brooks and rivers dash the flies so quickly along, that if the angler is below them, they are at his feet almost immediately after reaching the water. Hallock and Bradford and almost every other American author on the subject favor down-stream fishing for trout, and in salmon fishing there is, of course, no room for any difference of opinion on the subject.

While upon this topic I take down an English book which I was glancing over a few days ago, and in which I had marked something that very much amused me, in connection with the matter now under discussion. David Webster, in his "Angler and the Loop Rod" (attributed in literary circles to Dr. James Livingstone, of Wisham), says "The reason why so many anglers prefer to fish down in all conditions of water is simply that they find it easier to do so. And no doubt fishing up stream is more difficult than fishing down." If the pursuit of difficulties be the angler's chief ambition, he should naturally, at all times, fish up stream. But most fishermen find difficulties enough ready to their hand without going out of their way to look for more, though the author of the work referred to, being a good angler himself, repeats the dictum of Plato that "what is good is difficult," and adds to the "difficulty," and, therefore, to the presumed "goodness" of his sport, not only by his method of stream fishing, but also by the weight of the rod with which he does it. He describes it as being a two-handed spliced rod, from 13 feet 6 inches to 13 feet 8 inches in length. As the butt is made of ash, the middle piece of hickory and the top of lancewood, the rod must be quite as heavy as those generally used by American anglers for killing salmon.

The American Sardine Industry.

So noticeable has been the decline, of late, in the herring fisheries of the Bay of Fundy and the western Nova Scotian coast that an investigation has been undertaken to determine whether or not this decline is attributable to the operation of the so-called sardine weirs, or brush traps, especially off the New Brunswick shores. Between 700 and 800 of these traps are fished every season under licenses issued by the Dominion Government, while on some of the West Isles off Passamaquoddy Bay, limited parts of the shore are thickly studded with these fish-weirs. In the waters further north, especially in St. John County, N. B., there has been a serious decrease in the supply of full-grown herring, so much so, in fact, that certain schools which provided important fisheries in former years, have totally disappeared. The growth of the Maine sardine industry has been remarkable, especially in view of the fact that the major part of the raw material comes from Canadian waters. Its value is about $3,000,000 per annum, and as there is no such fish as the real sardine in American waters, those canned in Maine being the young of the common herring, it is not surprising that there should be a large decrease in the supply of the latter.

E. T. D. Chambers.

A certain Scottish laird recently invited an English friend to stay with him for some fishing. One day the Englishman, who was a novice at the sport, hooked a fine salmon, and, in his excitement, slipped and fell into the river. The keeper, seeing that he was no swimmer, hooked on to him with the gaff, and was about to drag him ashore, when the laird called out, "What are ye aboot, Donal'? Get haul o' the rod and look tae the fush. Ma friend can bide a wee, but the fush winna!"

"Do you think that the theatrical profession leads to unhappy marriages?" "I have never been able to decide," answered the manager, "whether a stage career leads to divorce or divorce leads to a stage career."—Washington Star.

Reminiscences of an Octogenarian.

Part III.

BY THE OLD ANGLER.

(*Continued from page 463*)

"Let us to the ancient woods; I say, let us value the woods. They are full of solicitations."—Thoreau.

"Doubt not, sir; but that angling is an art, and an art worth your learning; the question is rather whether you be capable of learning it."—Izaak Walton.

FIFTY years ago anglers in the Provinces were a very small brotherhood. The officers of the regiments stationed at Halifax, St. John and Fredericton were the envied exemplars of this sport, and did much to spread the love of it in Nova Scotia and New Brunswick. In the early forties of the last century the Thirty-fourth Regiment formed the garrison at St. John, with a detachment in Fredericton. The officers of this regiment were enthusiastic sportsmen. Some had their fast horses and were always ready for a race on the sands with George Gilbert, Hugh McMonagle or the first Roland Bunting, the father of the turf in New Brunswick. If the Octogenarian's memory has not failed him, a captain in this regiment was Lord Hill, whose great hobby was his horses. There may be some readers of FOREST AND STREAM in the Provinces who will remember both him and Larry Stevens, who kept a livery stable and ran the daily mail between St. John and Fredericton. Larry was a typical Irishman, with all an Irishman's humor and love of sport; he was, beside, a lover of horses and a good judge of their points. He was one of Nature's gentlemen, notwithstanding his unpretentious avocation, and was on easy terms of acquaintance with the sporting officers of the garrison. After repeated defeats on the sands, where Hill's blooded stock was too fast for Larry's best roadsters, he bet the officer twenty guineas that he would start from Fredericton with a pair of his stagers and take them into St. John ahead of Hill's fancy team with long pedigrees. The bet was accepted, and a great deal of interest was felt in the match. Hill started in a light sleigh, with costly robes, gold-plated harness, and what was then a novelty in St. John, the present web lines, and called "tapes." Larry had a light mail bag in a strong "pung," better known nowadays as a "cutter," with strong, plain, domestic-made harness and a buffalo skin. The road was in excellent condition, and for the first 20 miles the thoroughbreds led, then kept together, the drivers laughing and joking, each making occasional spurts, until Douglass Arms was reached, 50 miles from Fredericton. Here a hot meal awaited them, and each saw to his horses. After a rest of two hours they started on the last stage, which is about 18 miles from St. John. Hill's horses, totally unused to such work, soon fell behind Larry's more seasoned team. This was just what Larry had calculated on, and bidding Hill a sarcastic good-by, he soon left him far in the rear. When within five miles of the city one of his horses fell and broke his neck, which almost broke Larry's heart, more for his good horse than for the loss of his bet. When his lordship overtook Larry he found him with a fresh team, and they drove to town in company. When his friends blamed Larry for not putting the dead horse on the sled and driving in the single horse, which would have won the bet, as he might easily have done with the lead he had, Larry slapped his knee, opened his eyes wide, shook his head sadly and said: "May the divil admire me, why didn't I think of that?" Hill offered to consider the bet off, but Larry insisted on paying, and Hill declared him the truest gentleman he had met in his travels.

Several of the officers cared more for fishing and shooting than for racing, and every day of leave they could obtain was spent on the rivers or lakes or in the woods, which in those days were better stocked with fin, fur and feather than they are now. Moose, caribou and deer then went in large herds; bears were more common, while geese, ducks, woodcock, snipe and partridge were found within easy reach of the city. Sachem Gabe was then in his prime, and no better hunter ever guided sportsmen to their quarry in the forest, or more skillfully propelled his birch canoe on river, lake or stream. The surroundings were strange and the woods had all the charms of novelty. Eating *al fresco,* with an appetite that only hunters know, sleeping under the stars, wrapped in his blanket, on a bed of fragrant fir boughs, with his feet to the fire, was a new experience to men fresh from English cantonments, and they reveled in the change. Many of them soon became expert in the canoe and on the trail. Some could handle a pole or paddle or lug his pack in a fashion that surprised their Indian guides. One officer in particular, was said by Gabe to be "great hunter; good man in woods; same as Indian in canoe."

At this time the Schoodic Lakes and land-locked salmon were all but unknown to the little coterie of anglers in St. John. Roads were rough; travel difficult and the angling nearer home—at Loch Lomond, Mispeck stream, Beaver and Ball's lakes—was good enough, and the trout large enough to satisfy the most greedy fisherman. In those days it was much more difficult to lug home the basket than to fill it with trout running from 1 to 2 pounds. Consequently, there was no inducement to go further afield in search of sport. In 1862 the Fifteenth Regiment was quartered in St. John. Among the officers were Capts. Dashwood, Farquharson and Coventry, ardent sportsmen all, wild to explore that Canada of whose game resources every returned officer had told them marvelous stories. After having explored all the lakes in the neighborhood of St. John, these officers made a trip to the Schoodic Lakes, and their report of the fishing and of the game qualities of the land-locked salmon in Grand Lake Stream and the lakes above set our little coterie wild. In company with the late Sheriff Harding, well known to hundreds of readers of FOREST AND STREAM, the Old Angler made his first visit to these lakes, and had such sport as induced many subsequent visits in after years.

In his charming "Chiploquorgan, or Life by the Camp Fire," published after his return to England in 1872, Captain (now General) Dashwood has given us the best guide books to sporting in the Maritime Provinces and Newfoundland that the Octogenarian has ever seen. He makes the following remarks about the Schoodic salmon: "I may here say a word as to the species of the trout in these lakes, as it has been a matter of much controversy between American naturalists, some of whom affirm that they are pent-up salmon. * * * For my part, I do not for a moment suppose that these fish are salmon. In my opinion the idea is absurd, as there is nothing to prevent these fish going down to sea; and when the river was first blocked by dams, surely the fish then in the river would have followed their natural instincts and returned to salt water."

In opposition to this opinion, Prof. Agassiz, America's great naturalist, had pronounced these Schoodic trout to be degenerated salmon. In a sketch, describing these fish, printed in 1869, some years previous to the publication of General Dashwood's fascinating book, the present writer said, after a long discussion with two American gentlemen then camped on Grand Lake Stream, who were very intelligent men and fine anglers, one of whom suggested that hybridity might offer a solution of the difficulty:

"Scarcely, even if the hybridity of fish, which naturalists deny, were admitted. As both salmon and trout go to salt water, it is hard to suppose their mixed progeny would be averse to it. If these fish were known in the lakes before the dams were erected, that fact would be fatal to the degeneration theory."

"Why so?" asked Mr. R. "I do not see that consequence."

"For this reason. Before the dams were built on the river there was no obstacle to the free passage of the fish up or down, and they would spawn in the main river below Princeton as well as here in this stream. As we know the St. Croix was a fine salmon stream before the dams were built, we should have to admit that the perfect salmon and the degenerated salmon frequented the same stream, and that, under precisely similar conditions they had very dissimilar habits. This, I think, would constitute a distinct species. On the whole, I incline to the opinion that the supposition of a distinct variety presents the least difficulty."

Since this was written, that close observer, fine writer and keen angler, Mr. E. T. D. Chambers, has given us his splendid book on "The Ouananiche and Its Canadian Environment," in which he exhausts the subject and goes far to prove that the ouananiche, or fresh water salmon, is the true parent of the *Salmo salar,* "which has acquired the habit of wandering from the crystal Eden in which it was created, into the salt wilderness of the sea, by its acquisition of a taste for the flesh-pots of the briny deep." The copious quotations from foremost American and English naturalists and observers go far to prove that Mr. Chambers' theory, if not the correct one, is that which best fits all the facts, so far as these are known to the scientific world. The Old Angler has great pleasure in calling the attention of brother anglers to this most instructive and entertaining book, published by Harper & Bros. in 1896. No more competent authority and few such fascinating and instructive writers have added their quota to the literature of fishing; no more delightful reading can the disciples of Father Izaak desire.

Since "Chiploquorgan" was written, General Dashwood has many times crossed the Atlantic and renewed his acquaintance with the forests and rivers of New Brunswick, Nova Scotia and Newfoundland. His last visit was in 1900, when he was somewhat stouter than of yore, but as vigorous and active as ever in his pursuit of big game. Whether he still holds to the opinion stated in "Chiploquorgan" that there is a sea trout in the Provinces distinct from *fontinalis,* the writer cannot say; but he has often wondered that so acute an observer could write as follows: "Sea trout frequent, more or less, all the rivers in North America. In some seasons they are so numerous at the commencement of the run as to be a positive nuisance to the salmon fisher." That Capt. Dashwood should have fallen into this error, is not strange; but that so competent a naturalist, and an angler of such experience as Mr. Charles Hallock should have perpetuated this error, is somewhat surprising. The Old Angler's experience of the rivers of New Brunswick and Nova Scotia extends over a period of 65 years; 22 of these he was an officer of the Fisheries Department of Canada, and his duties took him to all the rivers in both Provinces. He is convinced that there is not, in the rivers of Nova Scotia or New Brunswick, any trout distinct in appearance and habits from *fontinalis;* until he sees and handles such a fish, he is forced to retain his present belief, the grounds of which he here presents to his brother anglers and those naturalists who read FOREST AND STREAM.

As a schoolboy on the banks of the Miramichi—the best river for so-called sea trout in the Provinces—the Old Angler caught these trout through the ice in the tideway from December until March, when they left the upper tideway for the estuary and mouth of the river to meet the first run of smelts. The larger trout in the upper reaches of the river also descended to meet the smelts as they came in to spawn in the smaller streams and large brooks that empty into both sides of both branches of this noble river. In the mouth of June large numbers of these so-called sea trout are found at Indiantown on the southwest branch, just below the confluence of the Renous River. In his boyhood both Indians and white settlers resorted to the mouth of the Renous to fish for these sea trout, which linger there for the last straggling runs of smelt and afford the finest sport for anglers, as they will greedily take almost any fly offered. Every season angling parties from St. John still resort to Indiantown for these sea trout, and find good sport; few of them think any more of the matter. But mark, now, the facts: When the last of the smelts disappear, so also do the sea trout from Indiantown; but their course is upward to the headwaters, not downward to the sea. This fact is proved by their being caught in the gaspereau nets from Indiantown to the head of the Settlements, above Boiestown, some 50 miles distant, and afterward by salmon fishermen, still higher up, and thence to the headwaters of the river. No fewer than four times has the Old Angler crossed from St. John waters to the extreme headwaters of the Southwest, and in his downward course has caught these sea trout weighing from 1 to 2½ pounds so plentiful that, for want of salt to save them, he and his companions have liberated as many as twenty in the course of a few hours' fishing. This was before the settlements at Glassville and Beaufort, which have seriously depleted the headwaters and consequently reduced the numbers resorting to the tideway.

These remarks are strictly applicable to all the rivers on the north shore from Restigouche to Shediac, and from Nouvelle to Gaspé. The so-called sea trout, instead of coming from the sea into the river, go down from the upper waters to the mouths of rivers for the better feed to be found in their estuaries. Every considerable river on the north shore has its sea trout; but there is one fact that should settle the question forever in the minds of all competent observers. The sea trout of the Restigouche, the Nepissiguit and the Miramichi, are not to be distinguished from those of the smaller rivers, except in point of size. In these three rivers alone do they reach the weight of 3 pounds, and these are rare. From 1½ to 2½ pounds is the usual weight of sea trout in these three rivers; but the numbers of the latter weight have sadly fallen off since the writer caught them in his boyhood. The smaller rivers all along the cosat have their sea trout, but none so heavy as those in the larger rivers, though in all other respects identical in appearance and habits, and all spawn in the upper waters of their respective rivers. The Nepissiguit furnishes demonstration of the utter fallacy of the sea trout cult. The mouth, between the Capes, is narrow. In the boyhood of the Old Angler the trout from the river came down in spring in large numbers to meet the smelts coming in to spawn. Many were taken in seines used for the purpose of catchin smelts, which were taken in vast quantities, and there being then no means of getting them to a market, they were used as a fertilizer on farms in the neighborhood. Since the I. C. R. has furnished a means of reaching Provincial and U. S. markets, frozen smelts have formed a large export from all the Northern Counties. Last year the aggregate shipments from New Brunswick amounted to 7,863,000 pounds. Return we to sea trout. After the smelts have disappeared, the trout returns to the upper waters whence they came, and intense is the annoyance of salmon anglers at Rough Waters, Round Rocks, Middle Landing and the falls pools to find his most artistic work interrupted by the greedy grip of a sea trout, sometimes as large as 2½ pounds, but only a nuisance when the cast was made in the hope of raising a salmon that was surely within reach. How often has the writer cursed the splendid trout which, under other circumstances, he would have blessed, that took his fly at mid landing and by his rumpus effectually destroyed all hope of raising that salmon which yesterday nosed his fly on the surface and sank back behind the white stone, whose glint could be seen within easy cast.

Ay de mie! How the old time comes over me! Again am I on the Nepissiguit—paradise of anglers! From the head of tide to Grand Falls is only 20 miles. But in this distance are displayed, on a small scale, all the features of a great river. There are long stretches of deep and quiet water, placid as a pond; rough reaches of roaring rapids with huge boulders standing high above the crested waves; rocky ridges over which the waters, pent up by the narrow gorges through which they roll and roar, seethe and swell, rush and wrestle till they reach a smoother course, when they spread out into broad shallows with pebbly bottoms, over which they laugh and dance at their recovered freedom. At length is reached a miniature Yosemite, into which the whole volume of 60 miles of river pitches over a short perpendicular fall, and then cascades down a gorge inferior only in size to America's great spectacle of the sublime and beautiful! The shore is as various in its aspect as the stream. In some places woods grow to the very edge and overhang the water; in others a smooth and grassy strand delights the angler; here steep and frowning banks almost forbid access to the stream; there a sandy beach offers fine footing, while sometimes a swampy shore makes passing difficult. Several small tributaries add their waters; the most important is Gordon's Brook, which takes its rise not far from the northwest branch of the Miramichi. In spring, when the water is high and cold, to fish from a canoe such places as cannot be reached from shore, is more convenient; but in summer, when the water is warmer, there is scarcely a good cast on the whole stream that cannot be reached by wading knee-deep. And, O dear! There is not a cast on the whole 20 miles of this delightful stream from which the Old Angler has not brought his salmon to gaff! When "Dominie Gilmour" spent his annual two months in camp at Pabineau or Grand Falls, and was joined by his old crony, Bob Tannehill, who regularly made the weary journey by stage from St. John to Bathurst to foregather with his old chum from the Tweed, and enjoy such sport that even the Tweed could furnish no better, who can blame them if, under the genial influence of a *quaigh* of guid Glenlivet after a day's rare sport, they felt with their immortal countryman and brother angler that "worldly men and worldly cares might all gang tapetterio?" Dear old Thad Norris! How, at Rough Waters, on a previous visit, did he gloat over his first salmon! But, there—surely old age is garrulous! I had quite forgotten the sea trout in following him to his proper habitat. *Revenons a nos moutons.*

From Rough Waters to Grand Falls these sea trout are found all summer. After spawning the largest descend to tideway, where they spend the winter, and are not found at the Capes until the following spring. Grand Falls are impassable for both salmon and trout, consequently it follows that if any trout are caught above the falls, they cannot be sea trout. The writer has twice canoed from Grand Falls to Nepissiguit lakes, which are the source of the river. All along its whole course, in suitable water, he has taken trout identical in shape, color, markings and weight with those below the falls, while in the lakes they ran still heavier; along the river they varied from 1 pound to 2½—those in the lakes often reached 3 pounds. Crossing the short portage into Nictor Lake, the source of the Tobique, precisely similar trout were caught, but these were not so large, running from ¾ to 1½ pounds; these never go to salt water, which is some 140 miles distant. Surely these incontestable facts should settle the question as regards all other rivers on the North Shore. From Shediac, in Westmoreland, through Kent, Northumberland and Gloucester to Dalhousie on Restigouche, every river has its sea trout identical in every minute particular with those in the three larger rivers, except in weight, and this varies as the rivers are larger or smaller. In the Charlo and Jacquet the sea trout are nearly as large as those in Restigouche.

The two rivers between Louison and Benjamin are small, as are their sea trout. Nepissiguit and Miramichi are large rivers and their sea trout are the largest in the Province. The intervening rivers, Caraquet, Pokemouche, Tracadie and Tabusintac are considerable rivers, and in them the sea trout run large. Below the Miramichi the rule still holds. Kouchibouguac, Richibucto and Buctouche are all small rivers and their sea trout seldom exceed 1½ pounds. Cocagne and Shediac are still smaller streams, and their sea trout seldom reach a pound in weight, though in all other respects they are indistinguishable from their larger brethren. In all the above rivers the sea trout meet the smelt in spring, spawn in their upper waters and winter principally in the tideways. But now comes the crux, which those who believe that we have a sea trout distinct from *fontinalis* must explain or revise their theory. Along the whole coast, from Richibucto to Dalhousie, salmon nets are set in the very track of these trout, which the theorists say come from the sea to feed on the smelts as they ascend the rivers to spawn. These nets are set from May until the middle of August, and all have "hooks" or pockets of mesh small enough to capture every large trout that enters them. Can the theorists explain why these nets, set in the estuaries of all these rivers, in the very track of the sea trout coming from and returning to the sea, rarely capture them? The few taken are caught in nets set closest to the mouths of rivers. Those set furthest from the rivers seldom or never take a trout, but capture on the average as many salmon as their neighbors. If, as the theorists assert, these trout come from the sea in "comtless myriads"—"immense schools of thousands of barrels"—is it not amazing that so few are caught in salmon nets? Another fact, well known to all who have really investigated the question on the spot, calls for explanation from those who have pinned their faith on this mythical sea trout. For the last ten years of the writer's official life, mackerel traps and purse seines were operated as far up the Bay Chaleur as Caraquet—about its narrowest part. As these traps were set in the direct track of the sea trout, if they came from or returned to the sea, and as purse seines take everything they surround, special instructions were given to local overseers and wardens to visit the localities daily and report to the writer the number of trout taken. So far as his memory serves, not a barrel of trout was ever taken in either trap or seine. Still another question calls for answer from the theorists. If, as they contend, these trout follow the smelt from the sea, and return with them to the sea—where do they spawn? If they answer "in the sea," they must give up their contention that sea trout belong to the salmon family, for all the varieties of this family—if we can trust the naturalists—require fresh water to develop their ova. Nor do *Messieurs les Savants* help them any when they call it a *char,* take it out of the salmon class, invent a brand new class for it, and give it the euphonious name—*Salvelinus;* for even they make it spawn in fresh water. The writer understands that Mr. Hallock came to his conclusion principally from what he saw on the north shore of the St. Lawrence and the Labrador coast after he had personally inquired into the subject on the north shore of New Brunswick. Never having been on the Labrador coast, nor ever having seen a sea trout from this locality, the Old Angler does not presume to express an opinion. There may be for aught he knows, mermaids and centaurs in that mysterious region. But presuming that Mr. H. recognized these sea trout as identical with those he saw in Bay Chaleur, the inevitable conclusion is that their appearance and habits were the same. In that case there can be little doubt that their true habitat is the rivers in whose mouths they were seen, and that, like all others of the family, they spawn in fresh water, and in that water their ova hatch and grow.

The Old Angler makes no apology for the perhaps tiresome length at which he has dwelt on facts which are irrefutable. Had any writer of less note than Mr. Hallock supported this untenable thesis, he would not have wasted time on its refutation, though the error is so widely spread among United States anglers. Mr. Hallock's standing as naturalist, scientist and angler, his long connection as an indefatigable field worker with the Smithsonian Institution, and the great debt all true sportsmen owe him, render anything from his able and prolific pen worthy of grave consideration. I have not seen all he has written on this subject, but truth compels me to say that what I have seen will not bear close examination. Had we an opportunity of discussing the question, I feel persuaded he would not have committed himself to its support. I submit for his consideration the above facts. In my opinion he must either refute them or revise his conclusions. V.

[TO BE CONTINUED.]

CHICAGO AND THE WEST.

The Perfect Fly Rod.

CHICAGO, Ill., Dec. 6.—I have been very much interested in a personal communication sent me by Mr. C. H. Mitchell, of Dover, N. H., who seems to be something of an amateur rod builder, but possessed of more than average amateur skill and wisdom in matters pertaining to fly-rods. With Mr. Mitchell's consent I offer his letter, which is as follows:

"Like yourself, I chased the perfect fly-rod for several years before I caught up with it. When found it was this: Handgrasp, birdseye maple; first joint, bethabara wood; second joint and tip, greenheart; length, eight feet four inches; weight, 5⅞ ounces. It was built by these fair hands after much reviling by rod-makers, who had no conception of their use. I had offered several kinds of money for a rod such as I wanted; had handled rods by several celebrated makers, but every one had the inevitable 'kick,' which I so heartily despise.

"I entreated one maker to make me what I wanted, but he said, 'I have quite a reputation for rod-building, and would not care to injure it by putting out a freak.' That let me down. I said, 'Will you kindly sell me a set of fittings such as I may select?' He said he would, and this was my selection: Metal reel-seat, ¾-inch diameter; first ferrule, 11-32 inch diameter; tip ferrule, 5-32 inch diameter; which with winding check, rings and keepers, all German silver, cost me $3.15, and subjected me to his scorn—as thus: 'I want to see that when you get it done.' I replied: 'If it proves what I think it will, I want you to see it. If it does not, no one will see it.' Many have seen it. I have used it twelve years—almost exclusively—and bait-fishing in Onawa Lake one day in '99, I landed five trout (square-tails), weighing 11¼ pounds. So much for its work. In its action it is like a high-grade whalebone carriage whip, the spring seems exactly where needed; it handles a No. 3 line to my perfect satisfaction. Fifty to 60 feet is all I can put out with accuracy, but within its capacity it is better than the best. It could be lightened a bit by using sumach for grip, and perhaps a ferrule 10-32 inch diameter in place of the 11-32. I would have used a ⅝ reel seat if there had been any on the market.

"I formerly had more opportunity to 'experiment,' which aided the successful pursuit of the 'perfect fly-rod.' For the last eight years I have been in the sporting goods trade, and during that time have never been shown a rod whose performance pleased me. It may seem egotistic, but I think in the building of my little rod I discovered the secret of the universal 'kick,' which is too large a ferrule at the top of the middle joint, in proportion to the first joint ferrule.

"There should in my opinion be at least 5-32 inch difference between the two, to give proper spring and balance, and eliminate the top-heavy 'kick.' I have earnest hope for your success in possession and use of the 'perfect fly-rod.'"

What Mr. Mitchell says in regard to the difference in size of the middle joint ferrules to a fly-rod is very interesting indeed, and may be of value as suggestive to other amateur rod makers. Most rods, as we see them, are built upon a straight taper from butt to tip. I do not believe that any rod can have perfect action which is so constructed. I have earlier mentioned the very comfortable fishing rod made by Asa Stuart, an amateur of Grand Rapids. I notice that his rods are bellied out in the middle of the joints, slightly, indeed almost imperceptibly, yet certainly to some extent. I do not know by what means Mr. Stuart reaches his results, but the result itself is apparent in the easy, smooth delivery of the line, without kick and without excessive wrist or arm movement, which is necessary in the use of too many of our fly-rods. I am perfectly clear in my own mind that a rod can be powerful without asking too much muscular strength in its use; it can be easy of action without being weak; it can be comfortable to use all day and yet quick enough to strike a fish quickly and fight it successfully. I believe that our choke-bore fly-rods will be superseded eventually in the shops of many of our best makers. Certainly there ought to be a variety of rods, or rather of types of rods, offered by any really good class maker. If our leading gunmakers made only one type of gun, bored in only one way or fitted in accordance to only one pattern, they could not stay in business. It is something of a paradox, but none the less true in my opinion, that the American fly-rod makers make the best rods in the world, but still do not make them as good as they can and some day will.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

The "Old Angler."

Editor Forest and Stream:

I am glad that Mr. Venning has been moved to write up his river reminiscences. No writer since Capt. Dashwood has ever put pen to paper who can, or does, so graphically impart the realism of salmon fishing to the reader. I say this without fear of dissent. He had this reputation when he contributed his inimitable series of angling sketches to Stewart's Quarterly in 1867, and thirty-five added years do not seem to have impaired his ability to "jerk a quill."

What a blessing it is to be mentally vigorous at eighty! Venning is not only a thorough master of the art, but he seems to understand the idiosyncracies of the fish by intuition. And how vivid are his recollections of bygone friends and scenes! and with what pathetic tenacity he holds to those who survive. Let us rejoice that he still lives to write! And I would that he was not too obese to continue flailing, like Walter M. Brackett, who is but four years his junior, and still in the ring. Egad! how the old veteran demurs to being laid on the shelf, *pas capable!* But why should he mourn? Let him betake himself to his dory and try sitting, for one of the less active of the thirteen varieties of fishes which he enumerates as denizens of the Mirimichi and its estuary. Let him stick to his rod as of old. F. E. Spinner did at 86; and if perchance the last call comes as his did, die in the boat with his jumper on! It is the fashion of some Indian tribes to *bury* in canoes; just as it was of the old Scandinavian vikings 1,000 years ago. Suppose him bury in canoe, eh? CHARLES HALLOCK.

I was fishing the Aln and standing in the water thigh deep, when I felt some heavy body push from behind through between my legs. I naturally gave a start on looking down to see the head and shoulders of a very large otter half through. The beast gave a great wriggle, almost upsetting me, and then dived up and across the pool. A friend was standing about five yards from me and we both saw him distinctly. [I certainly never heard of such an incident before, and it is lucky Mr. Hardy did not get bitten. I remember once wading in the Barle and putting my foot on the head of a 16-pound salmon, which nearly upset me; it was lying with its nose between two stones. I have once or twice had a good trout, which I had hooked when wading, bolt down-stream between my legs and smash me, but never got so unpleasantly close to an otter.—ED.]—London Fishing Gazette.

..."I tell you," said the Cynical Codger, "the President's message must have been an awful hard task. Just think how hard it must have been to resist the temptation of putting in several of his bear-hunting stories and experiences."—Baltimore Herald.

The Kennel.

Canine Elegies and Epitaphs.

XXIX.—Moustache.

IN 1779 a young dog, who apparently had no master, came, no one knows how, to Caen, France, and met there a regiment of grenadiers starting for Italy. Urged on, apparently by destiny, he followed them. He was to all appearances a regular street cur, dirty and ugly, but he had such a bright expression and seemed so intelligent that they did not hesitate to take him. His new companions forced him to act as sentinel, to obey orders, to keep step, to become accustomed to the sound of firearms, to obey roll call, and all other duties the soldiers were called upon to perform. He received and ate his rations with them, and lived in every respect as his regiment was commanded to do. In going to Italy Moustache crossed Saint Bernard at the cost of unknown hardships, and encamped with the regiment above Alexandria. It was here that he was to accomplish his first great feat of arms. A detachment of Austrians hidden in the Valley of Balbo advanced in the night to surprise the grenadiers, and was heard by this vigilant dog as he was making his rounds. The soldiers were awakened by his barking. In a moment every one was on foot, and the enemy dislodged. To reward Moustache, the colonel had his name inscribed on the regimental roll, and ordered that he should have every day the ration of a soldier. He ordered that there should be put on his neck a collar bearing the name of the regiment, and the barber was ordered to wash and comb him every week.

Some time afterward there was a slight engagement, in which Moustache conducted himself very bravely. He here received his first wound—a bayonet thrust in the shoulder. It must be said here that Moustache was never wounded except in front. About this time he quarreled with the grenadiers, and deserted because they had left him tied in the garrison. Taking refuge with a company of chasseurs, he saw a disguised Austrian spy enter the French camp. Moustache, forgetting the insult he had received, welcomed the stranger by springing at his throat with much fierceness. This action astonished all at first, but they had time for reflection, and then remembered the sagacity of the faithful dog. The stranger was arested, searched and found to be a spy.

Moustache continued the series of his exploits. At the battle of Austerlitz, seeing the color-bearer surrounded by enemies, he flew to his rescue, defended him as well as he could, and when the soldier fell pierced with bullets, enveloped in his colors, Moustache, seizing with his teeth that part of the glorious flag which he could get, fairly flew past the enemy, and brought back to his company the blood-stained remnans. It must be said here that a charge of musketry had taken off one of his legs. This beautiful action merited honor. They took off the collar he wore, and Marshal Lannes ordered that they put on him a red ribbon with a copper medal bearing this inscription on one side: "He lost a leg at the battle of Austerlitz, and saved the colors of his regiment." On the other side it read: "Moustache should be loved and honored as a brave French dog." As it was easy to recognize him by his ribbon and medal, they decided that, in whatever regiment he should present himself, he should receive the portion of a soldier. He took part yet in several battles, and among others that of Essling (1809). He made with the dragoons two campaigns, and the brave dog fought every time he had the opportunity. He always walked in front, on the alert, barking when he heard any noise, and could not find out the cause. In the Sierra Morena Mountains he brought back to camp the horse of a dragoon who had been killed. It is said that at several times he showed this same act of intelligence. He had his last campaign with the artillery, and was killed at the battle of Badajoz, March 11, 1811, at the age of twelve years. They buried him on the spot where he fell with his medal and ribbon. On the stone which served as his monument they wrote:

"Here lies Moustache."

These simple words are more eloquent than the most pompous epitaph.—Detroit Tribune.

The Long Island Kennel Club, a bench show club, was organized in Brooklyn recently, with officers as follows: President, Dwight Moore; Vice-President, F. B. Thomason; Sec.-Treas., Jos. M. Dale. The club issued a call for a meeting to be held on Wednesday of this week, for the purpose of adopting a constitution and by-laws.

MISS EDITH RANSON, daughter of Mr. and Mrs. Chas. J. Ranson, of New York, who is visiting the Misses Cora and Alice Graham at Lake Hopatcong, on Saturday and Sunday shot thirty-five wild ducks sitting in a rowboat floating on the rough water.

Samoa 'Uma.

From the Literary World.

"Samoa 'Uma," that is to say "All Samoa," the whole of it. Scenery, history, people, customs, manners, laws, habits and "local color" in abundance thickly laid on; all is here in a book which, apart from its illustrations, appeals almost if not quite as much to the eye as to any other organ of sense, so pictorial is it in its descriptions and effects.

The author has "been there!"

Mrs. Churchill lets us slightly into the secret of her intimacy with this distant new possession of the United States in the blue depths of the Pacific, and that she has seen with her own eyes and knows with familiarity that of which she writes is evident from the first page to the last.

Here is the Samoa of Stevenson in all its nakedness, its torrid beauty, its savage gentleness, its artistic shapes and tints and fascinating naturalness; the girls in their dances, the men in their war paint and feathers, the cottages in their enveloping foliage, the breakers as they roll upon the shore, the palms and the brightly plumaged birds, the feasts and the formalities, the wrecks on the rocks of vessels from afar, and the hideous wrongs perpetrated by the white "Christians" on their dusky and helpless brothers of the sea.

Twenty-four chapters there are of as close and fond delineation as one could ask for, with just as many vivid pictures from photographs obtained with great difficulty amid the lights and shy conditions of the islands which rise like bunches of green from the expanse of blue.

Life is the keynote of the book. The landscape is there, and the hunts, and the creeping things and flying things, reminiscences of the disastrous tidal wave of 1889, glimpses of political complications, and wrangles that have helped on history, bits of romance, studies of rude arts and embryonic science, but most of all life, the life of the islanders in its primitive artlessness and serene simplicity, before it was vexed by the contaminating, the disturbing, the disheartening influences of what is called "civilization."

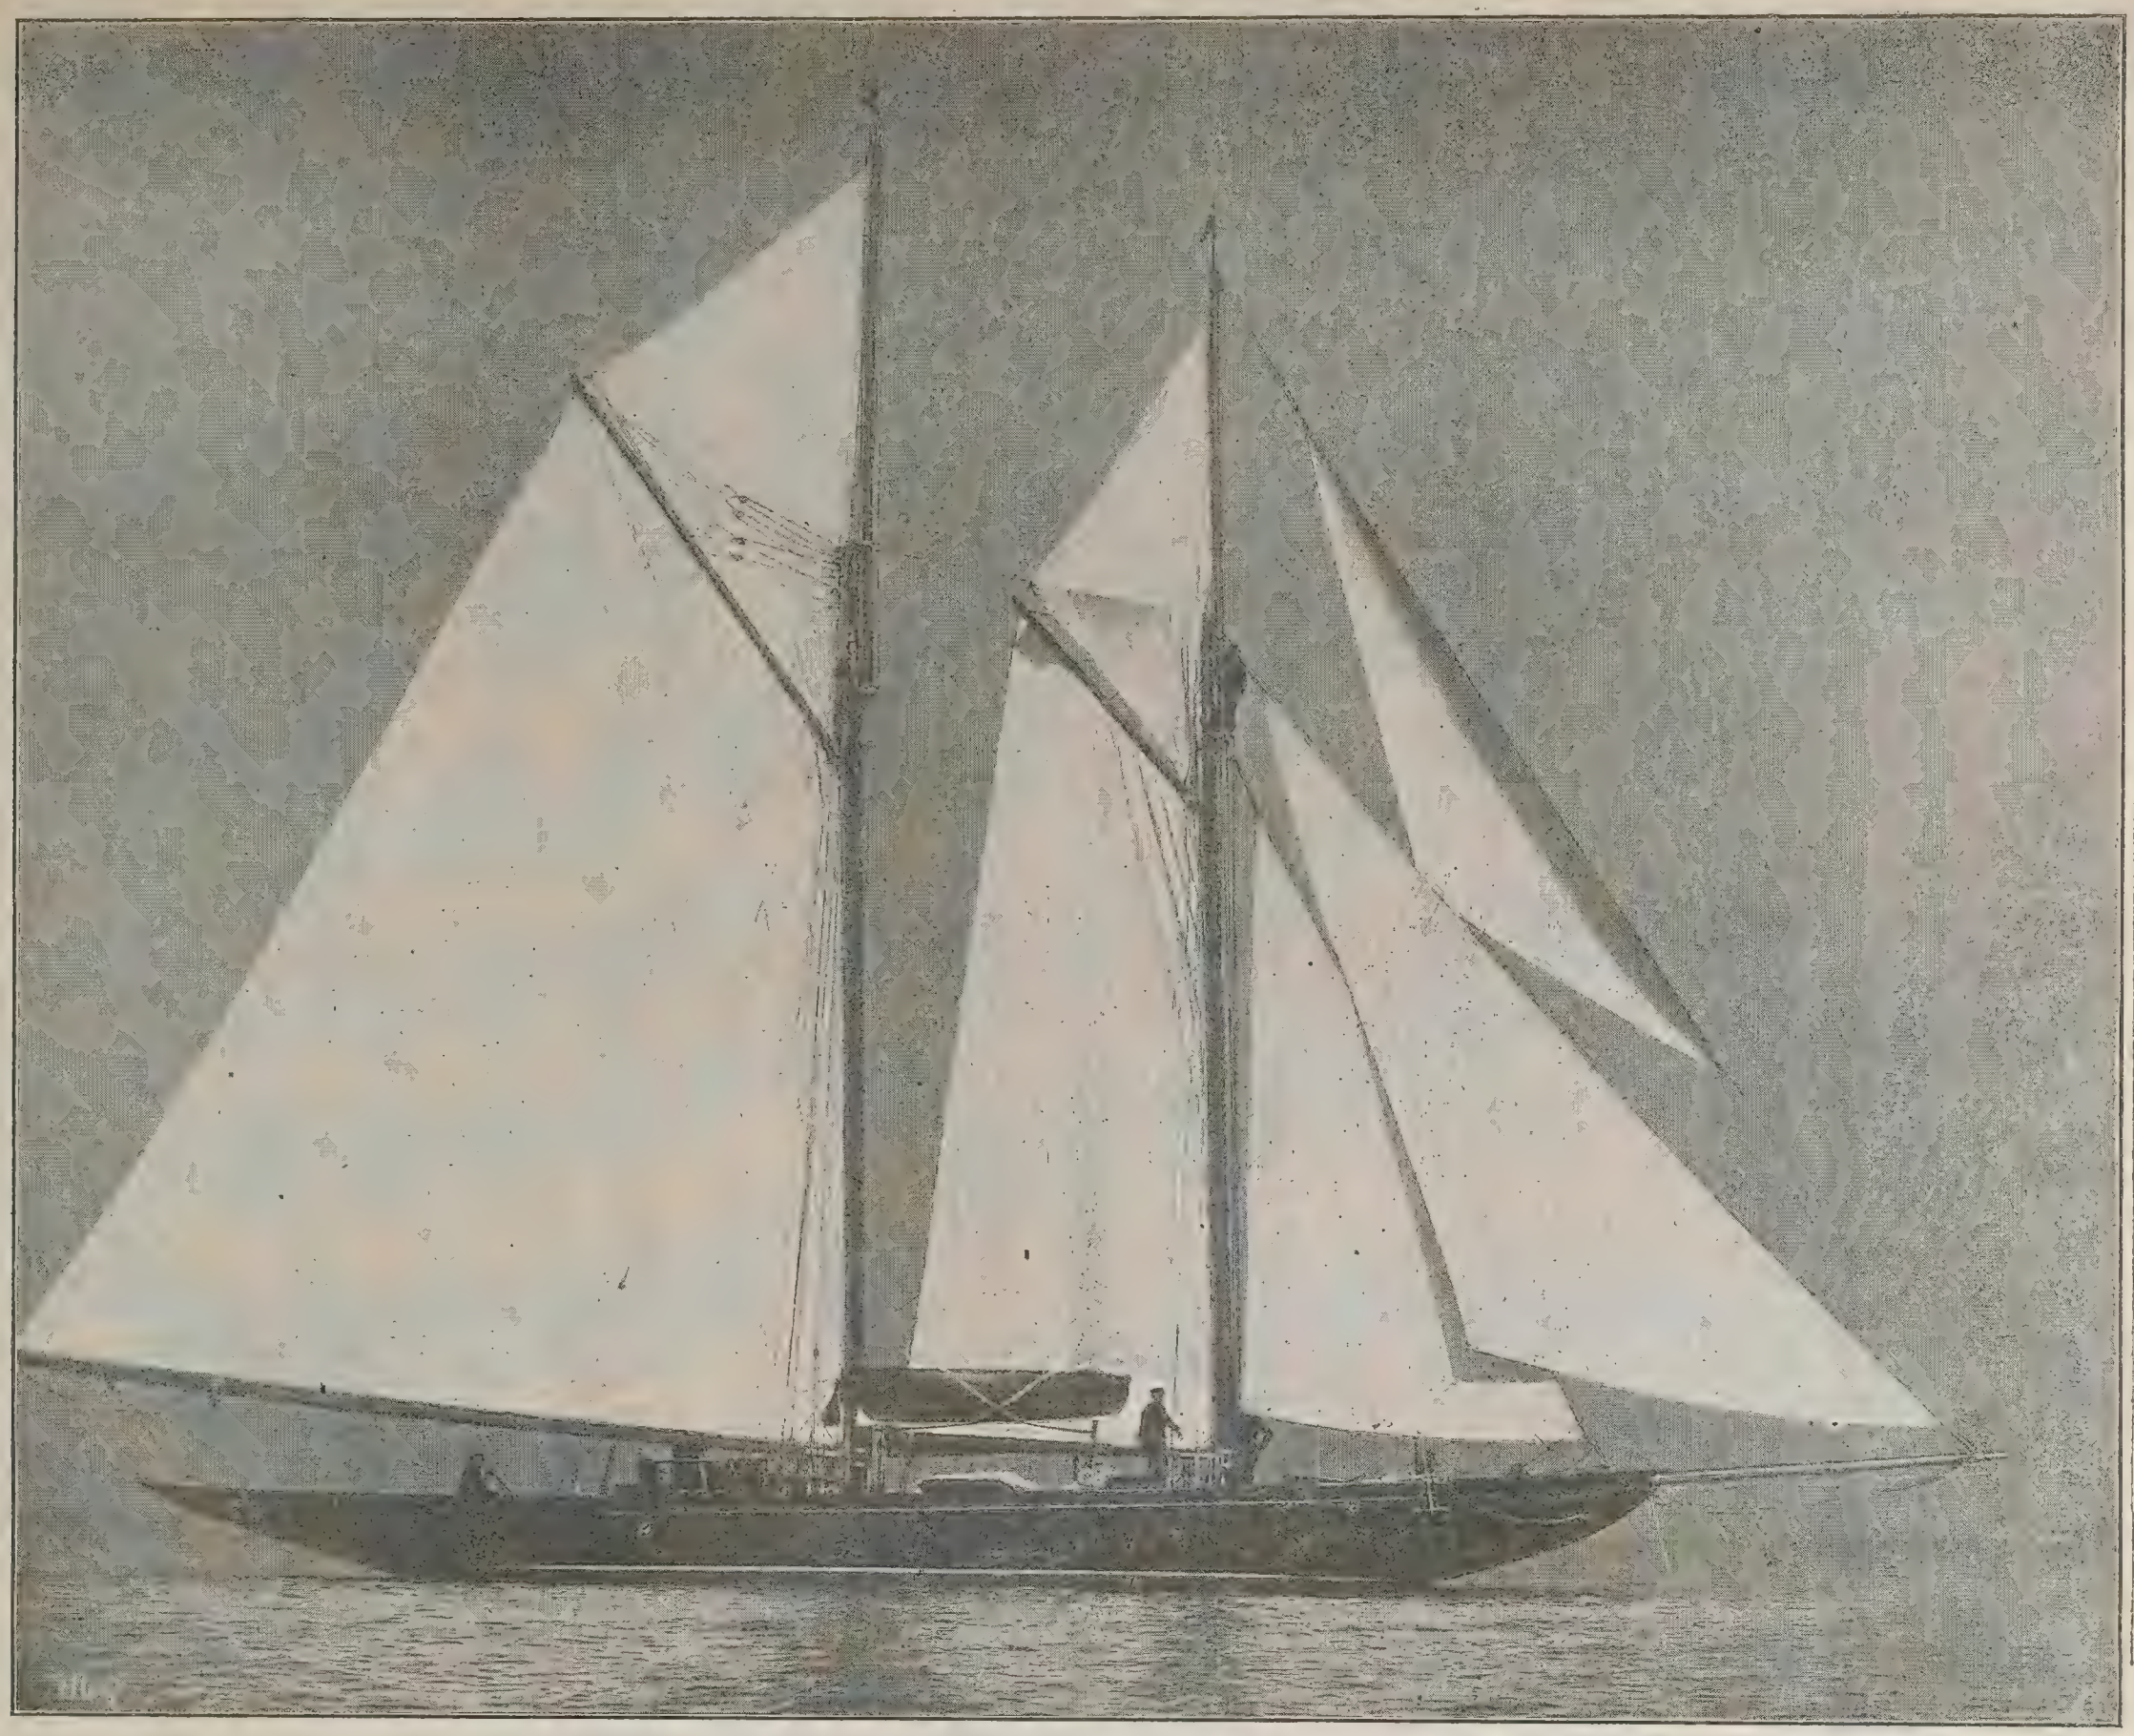
Mrs. Churchill has given us a true book about a remote and hidden corner of the globe, and a fascinating one. Read it. You will find it deeply and strangely interesting.

A Sure Cure for Pneumonia.

Boston.—Take six to ten onions, according to size, and chop them fine; place over a hot fire; and about the same quantity of rye meal, and vinegar enough to form a thick paste. Stir thoroughly, letting it simmer from five to ten minutes. Then put the mass in a cotton bag large enough to cover the lungs, and apply to the chest as hot as the patient can bear it. Before this gets cold apply another, and then continue reheating the poultices. In a few hours the patient will be out of danger. Usually three or four applications will be sufficient, but continue treatment until perspiration starts from the chest.

This simple remedy was formulated many years ago by one of the best physicians New England has ever known, and who never lost a patient by this disease.

Of the many cases I have known where this remedy has been tried it has never failed, even after the best local talent has pronounced the case hopeless. One of the best physicians in this vicinity says he has used this remedy for several years with success in every case. GEORGE L. BROWN.



CYGNET—DESIGNED BY TAMS, LEMOINE & CRANE FOR ARNOLD LAWSON.
Photo by T. E. Marr, Boston.

Yachting.

Cygnet.

During the winter of 1901-02 there was built at the yard of the Geo. Lawley & Son, Corp., South Boston, Mass., the schooner Cygnet, the plans of which appear this week. The builders did remarkably good work on the boat, and she is said to be one of the finest and most expensive yachts of her size ever built in an American shipyard.

Cygnet was designed by Messrs. Tams, Lemoine and Crane for Mr. Arnold Lawson, a son of Mr. Thomas W. Lawson, of Boston. The boat was planned to be a fast cruiser, and has more than filled these requirements, as she has shown good speed and is an excellent sea boat. She is a very handsome craft, and has been greatly admired. The overhangs are well balanced, the sheer graceful and the rig well proportioned. The bottom is painted drab and the topsails black, relieved by a gold stripe. A narrow copper line of white gives a very smart appearance, and the teak rail and deck trim make a good finish to the black topsides.

The deck is flush, and below there is considerable room which has been well utilized. The cabins are well laid out and splendidly furnished. The large companionway, which serves as a shelter in bad weather, leads below to the chart room, which is on the port side. This room is 4ft. 6in. long and is fitted with a sofa, gun rack, book shelves and a chart table with drawers underneath. Aft there is a large double stateroom 7ft. 8in. long. On each side is a berth with sofas in front. At the end of the berths are hanging lockers, and in the center of the after partition is a combination bureau and desk. There is a set marble wash basin under the companionway. Overhead there is a skylight, which gives light and ventilation. Opposite the chart room, on the starboard side, is the toilet equipped with a set marble wash basin, and a patent water closet, back of these is a roomy locker for linen.

Opening from the chart room is the main saloon, which is 11ft. long and runs the full width of the boat. Sofas extend along either side, and behind these are lockers and shelves. At the forward end on each side are buffets.

A door opens into the galley, which is 8ft. long. Here there is a large ice box, sink, range, dresser, dish racks, etc. On the starboard side, leading from the galley, is the captain's room, with a swing berth, bureau, desk and hanging closet.

The forecastle is 13ft. long, and there is ample room for the three sailors and the steward. There is a water closet for the men and locker room for their clothes.

Two boats are carried on the davits—a launch to starboard and a dinghy to port.

The principal dimensions follow:

Length—		
Over all	73ft.	8in.
L. W. L.	46ft.	
Overhang—		
Forward	13ft.	8in.
Aft	14ft.	
Breadth—		
Extreme	15ft.	
L. W. L.	13ft.	10in.
Draft—		
Extreme	10ft.	6in.
To rabbet	5ft.	4in.
Depth	7ft.	9in.
Freeboard—to top of rail—		
Forward	6ft.	
Least	3ft.	10in.
Taffrail	4ft.	5in.
Ballast—		
On keel	25,000 lbs.	
Sail area—		
Mainsail	1,416 sq. ft.	
Foresail	507 sq. ft.	
Fore staysail	271 sq. ft.	
Jib	370 sq. ft.	
Total area lower sails	2,564 sq. ft.	

The boat's construction, which is rather elaborate, is clearly shown on the plan of the midship section.

Steam Turbines.

BY CLINTON H. CRANE, OF TAMS, LEMOINE & CRANE.

In considering the substitution of steam turbines for reciprocating engines in marine propulsion, there are of necessity many points of view from which the subject may be approached; but there are two chief considerations which at once suggest themselves. First, a direct comparison of turbine and engine in weight, size, principles involved and general mechanical qualities. Second, the effect on the various elements of the vessel brought about by the essential differences, and a summing up of the gains and losses which may be anticipated in various cases from the change.

In the first place, there are two classes of turbines in successful use at the present time—jet turbines, which derive their energy from a jet of steam impinging on a series of plates set on a periphery of the wheel or disc on the same principle as water on a Pelten wheel. The whole expansion of the steam from boiler pressure to condenser pressure takes place in the jet itself, and the total energy is transformed to the velocity of the steam flowing from the jet.

The second classes of turbines are those known as the parallel flow turbines. Here the plates are set alternately on the periphery of a revolving comb and a fixed envelope, and the motion is caused by the sinuous flow of the steam from plate to plate. In this case the expansion takes place in the turbine itself.

In either case the turbine principle is entirely different from that of the reciprocating engine. The turbine takes its energy from the velocity of flow of the steam, and the engine from the initial boiler pressure and adiabatic expansion of the steam in its cylinders. Of course the velocity of steam flow in the turbine is caused by this same pressure and expansion, but in one case the transformation into mechanical energy is indirect and in the other direct. The steam velocities are extremely high, in the neighborhood of 4,000ft. per second, and as a turbine to run with the greatest efficiency must absorb this whole velocity, the peripheral speeds are at the best enormous and greater in the jet turbines than those of parallel flow.

The revolutions of a de Laval jet turbine of small size are about 35,000 per minute, and in the larger sizes from 8,000 to 10,000 revolutions a minute.

This tremendous speed has compelled the use of a reducing gearing.

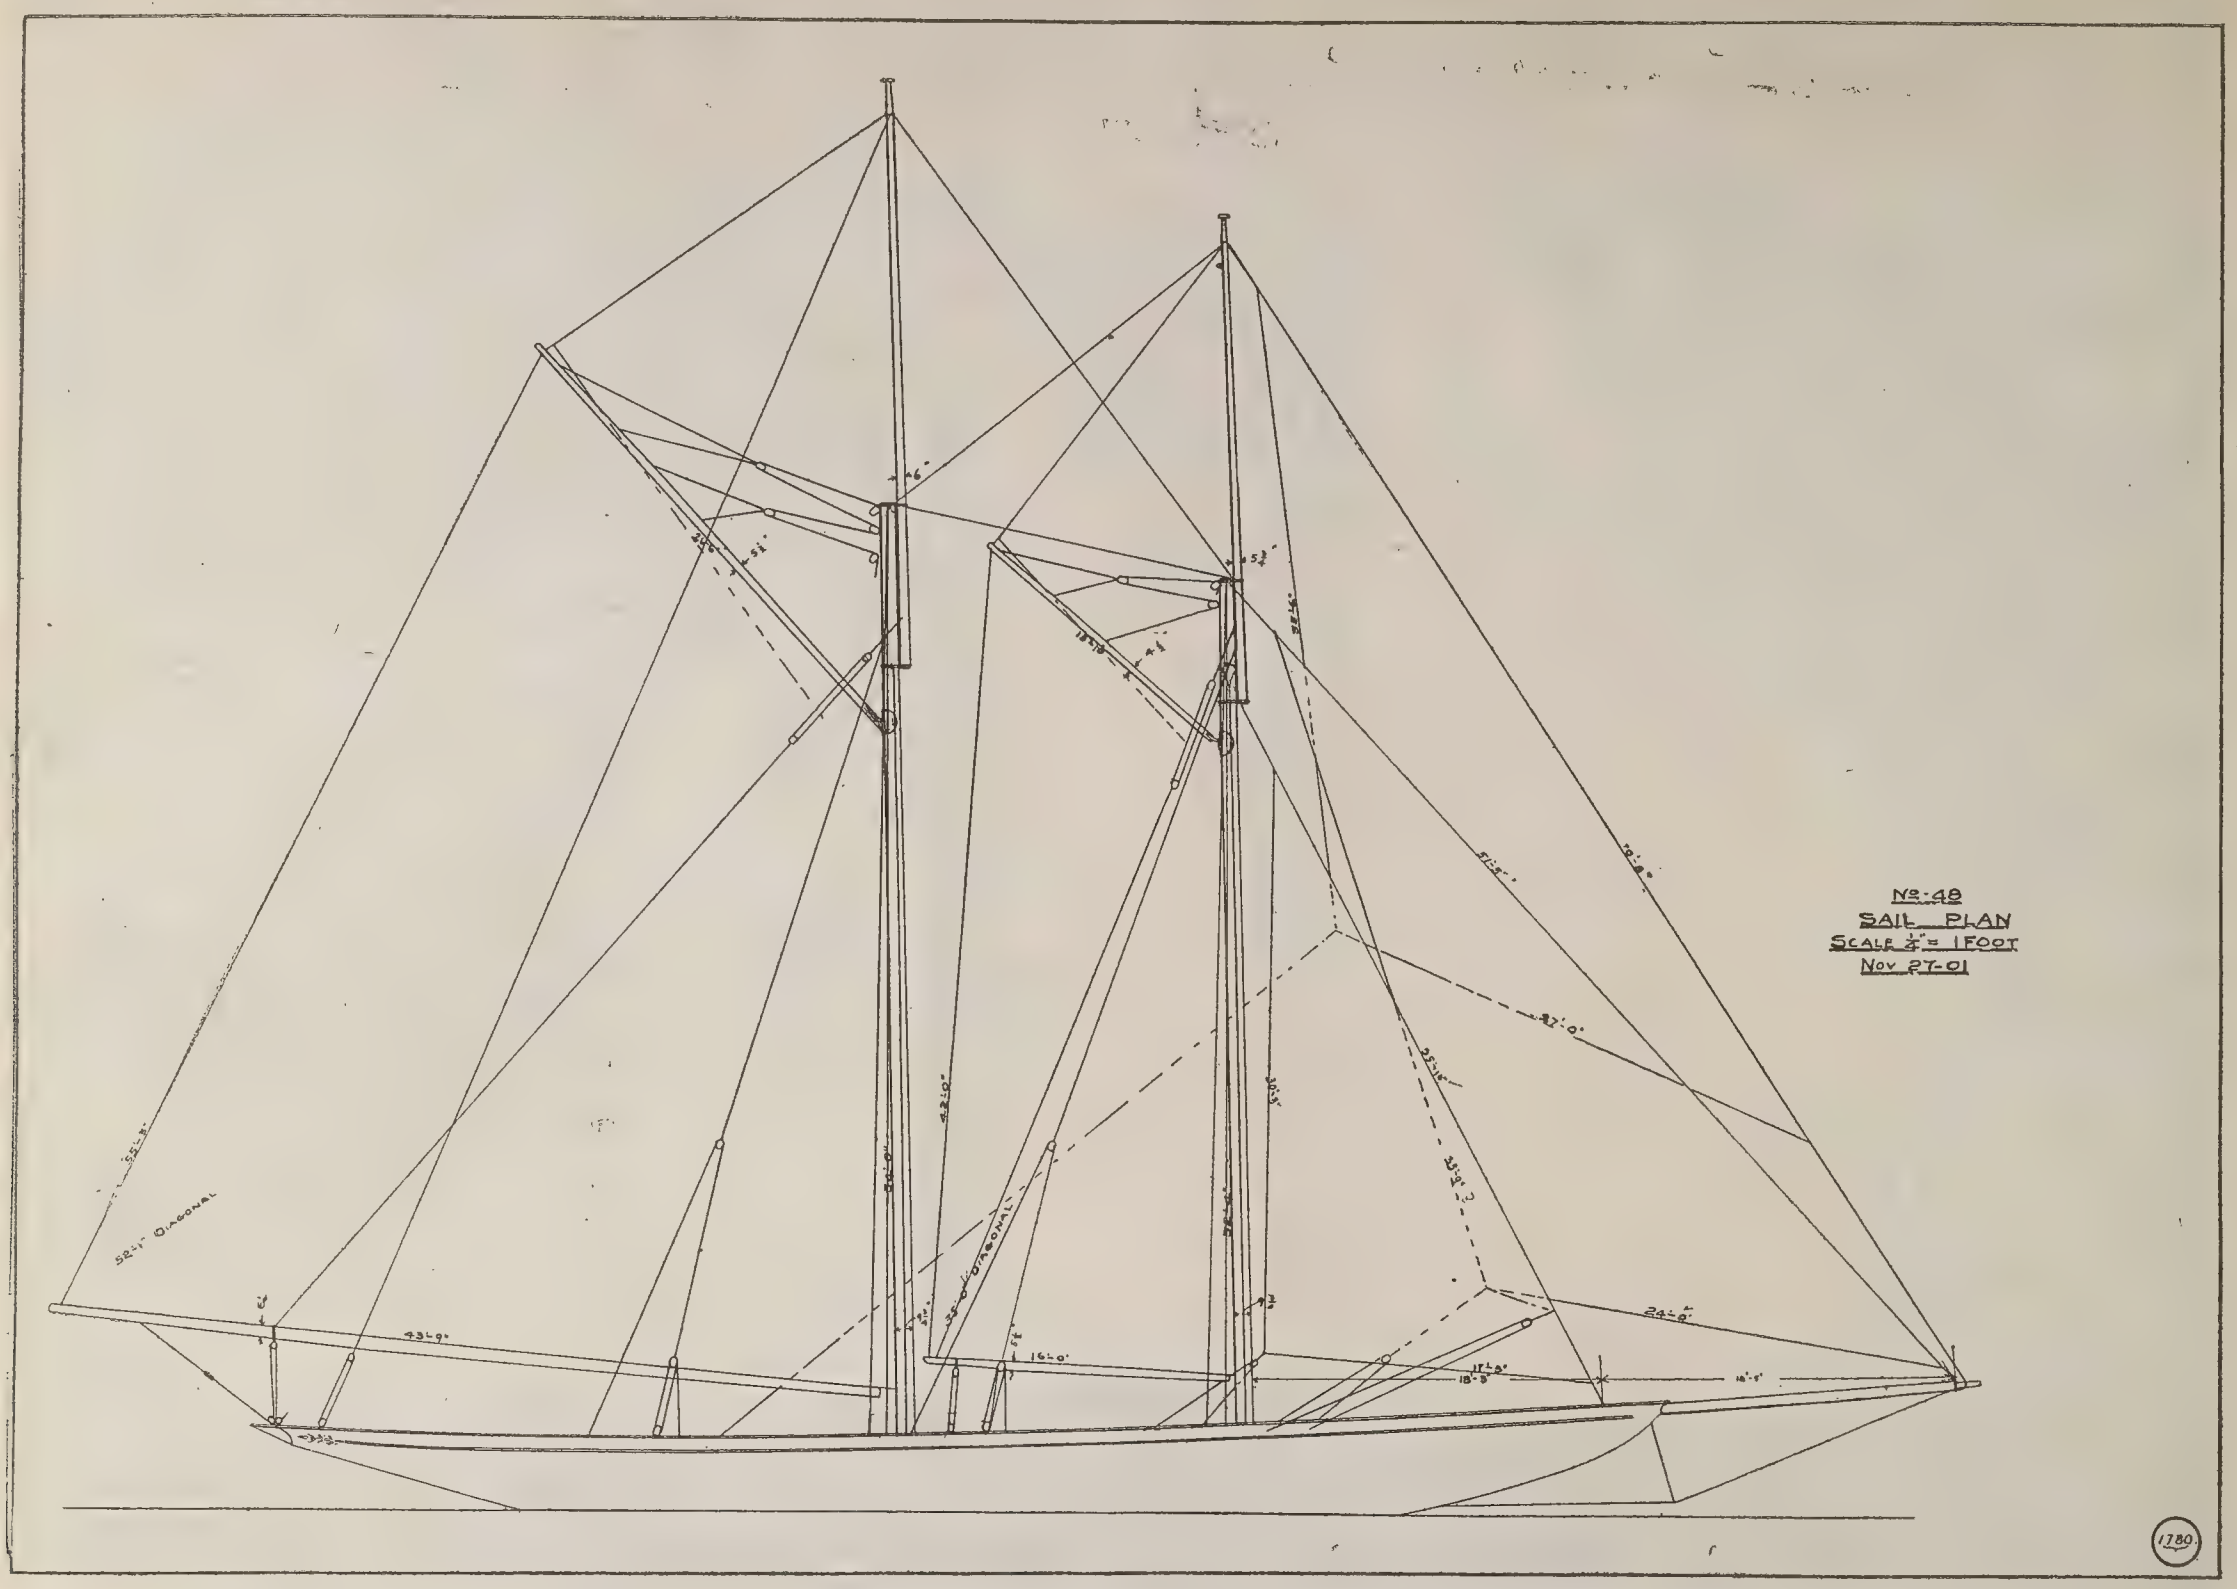
In the Parsons' turbine the smaller sizes have a speed of about 3,000 revolutions per minute, and the larger sizes about 500.

A high-speed reciprocating engine of corresponding sizes would have a speed of 600 revolutions per minute and 100 revolutions per minute respectively, or one-fifth as many as the Parsons turbine, and one-fiftieth as many as the de Laval.

Horse-power, which is the engineer's measure of work done, is a product of two factors—weight and speed, or in case of a revolving shaft, tort (that is, twist) and revolutions. This means that for a constant horse-power the tort will decrease in direct proportion to the increase in the number of revolutions, and as strains are in the main dependent on tort, sizes and weights will decrease as revolutions increase. We should therefore expect to find turbines of a given power much lighter than reciprocating engines, and as a matter of fact they are so.

The high-speed engines of torpedo boats and fast yachts weigh about 10lbs. per indicated horse-power. Steam turbines about 3 to 5lbs. per indicated horse-power. Engines of slower yachts and merchant vessels weigh about 20 to 30lbs. per indicated horse-power.

As regards efficiency, at the full-designed speed the turbine uses rather less steam per indicated horse-power than the best triple expansion engine, but at speeds less than the designed speed, the turbine uses from 10 to 25 per cent. more steam per indicated horse-power than the triple



CYGNET—SAIL PLAN—DESIGNED BY TAMS, LEMOINE & CRANE FOR ARNOLD LAWSON, 1901.

expansion engines at corresponding speeds, for in the case of a reciprocating engine efficiency is very slightly affected by changes of speed.

This loss of efficiency at low speeds is admitted even by Parsons himself, and it is stated that in the design of the newest torpedo boat destroyer to be fitted with turbines, supplementary reciprocating engines are to be installed for driving the boat at low speeds.

There is one point on which there is absolutely no comparison between turbine and engine, and that is the matter of vibration. With a turbine there is no vibration whatever, and, as in place of the fifty or more different bearings on a reciprocating engine, we have only two in the turbine; the cost of repairs and maintenance is as 1 to 25 in favor of the turbine.

Having made this brief comparison, it will be interesting to see how the fundamental differences affect the application of turbines to marine propulsion. To sum up: Our turbine must revolve certainly five times as fast as a reciprocating engine of the same power. It is inefficient except at one speed. It cannot reverse.

In its favor: There is practically no vibration. There is a very marked saving in weight and space.

Let us briefly analyze the advantages:

The saving in weight is from 5 to 7lbs. per indicated horse-power, but this is a saving which applies to the engine alone. The boiler and auxiliary machinery, such as pumps, piping, condenser, etc., in the case of the very high speed boats would weigh about 30lbs. per indicated horse-power. This would be the same whether we used turbine or engine. The coal to be carried would be the same, or nearly the same, in case both boats were always run at their full designed speed. At the slower speeds we should need to carry 10 to 25 per cent. more coal on a boat driven by turbines than one driven by reciprocating engines in order to go the same distance.

In the case of the high-speed boat, the machinery would weigh probably 50 per cent. of the total weight of boat and machinery.

In the case of the slower yachts or passenger boat, the boiler and auxiliaries would probably weigh 90lbs. per indicated horse-power, and the weight of machinery would be only 12 per cent. of the total weight of yacht and machinery.

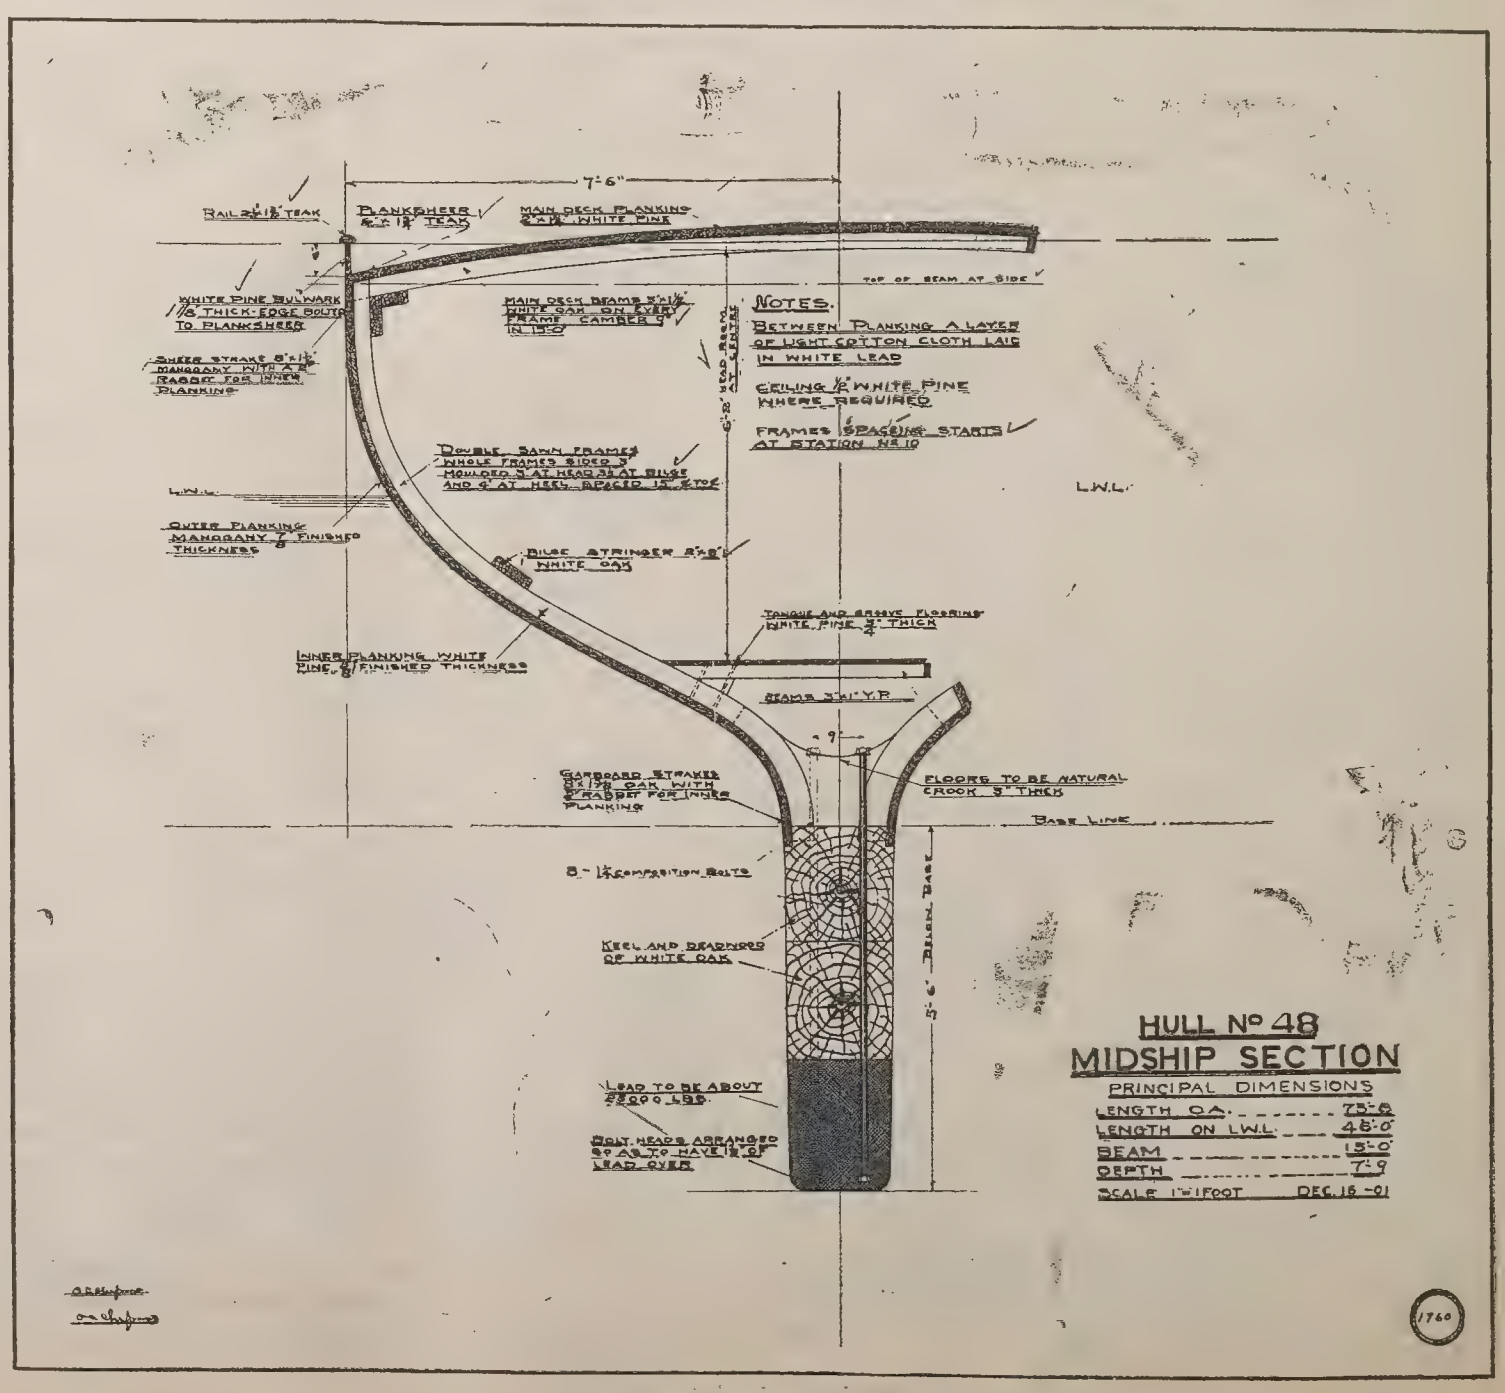
Now, let us sum up these facts: In the case of a high-speed boat, we could save 5 per cent. of our total weight of hull and engines by using turbines. This would mean greater speed. We should eliminate two-thirds of the vibration, as one-third is certainly due to the vibration of the screws. We should cut down our repair bill to the smallest dimensions. At slow speeds we should require a greater amount of coal than with ordinary engines; but this is not a matter of vital importance on a boat of this character. In the case of a cruising yacht the total saving in weight would be about 2 per cent. on the whole boat. This would mean practically no difference in speed. At slow speeds we should have to carry more coal, and as a cruising yacht rarely steams at top speed, this would be an important consideration. We would make a very small saving in room, and we should probably need more space for coal and would lose nearly all we gained from the small size of the turbines.

Repairs and vibration are small in vessels of this character with slow-moving reciprocating engines.

To sum up: Turbines are eminently suitable to high-speed vessels, and are of the greatest advantage in cutting down vibration and cost of repairs. In slower types of vessels they are also of advantage, though to a less degree, except where the vessels run at constant speed. So far as first cost is concerned, the turbine and reciprocating engine are practically on a par.

Turbines are now being so generally built for electrical purposes in this country and abroad that it is only a question of months when some of our best contractors will be willing to take up the matter of marine turbines.

Since compiling the foregoing the writer has had the pleasure of a trial trip on the new turbine-driven boat Revolution. The turbines on this boat are designed by Mr. Charles G. Curtis, and seemed to the writer to be the best turbines for marine propulsion yet placed before the public. The one drawback to the equipment seemed to be the noise either from the propellers or the roaring of steam, which was apparent in the after quarters. This, although less than is usual on boats of the same power driven by the ordinary type of engine, was ap-



CYGNET—MIDSHIP SECTION.
Designed by Tams, Lemoine & Crane for Arnold Lawson, 1901.

parent in contrast to the other lack of noise and vibration in the boat.

Mr. Curtis's turbine, so far as the inventor is willing to take the public into his confidence, is a combination of jet and direct flow, by which the inventor has been able to very materially reduce the speed of revolutions, and, therefore, the difficulty of designing suitable propellers.

These turbines develop 1,250 horse-power each, with a speed of revolutions of only 650. Parson's best result on the same basis is in the neighborhood of 2,000. Although 650 is a high speed of revolution, it is not beyond practical limits.

One great additional advantage of Mr. Curtis's machine is that by an arrangement of additional buckets and jets he is able to reverse his main turbine at three-quarters of full power.

The Revolution can be stopped and started more quickly than in the case of any such engine the writer has ever seen.

To run this plant at 2,500 horse-power, two engineers only are needed, as against four to six on ordinary triple engines of the same power.

The engine room is free from oil and water, and in this respect is a marked improvement to ordinary high speed boats.

So far as steam economy is concerned, it has been very thoroughly tested by Professor Denton, of Stevens Institute, the result of which test will shortly be made public.

The writer knows that the speed result obtained could not be bettered with triple expansion engines, using the same boiler and auxiliaries.

Manhasset Bay Challenge Cup Conditions.

BELOW we give the conditions to govern the races for the Manhasset Bay Challenge Cup, for 30ft. sloops, to be sailed under the auspices of the Manhasset Bay Y. C., of Port Washington, Long Island, next season.

While a matter of arrangement between the Manhasset Bay and the first club challenging for the cup, it is probable that these races will be sailed on the Wednesday, Thursday and Friday preceding Fourth of July, by which arrangement the various boats in this class, which promises to be the most active on the Sound, will be enabled to take in not only the cup races, but also Larchmont race week, which next summer will commence with Fourth of July.

The conditions have been very carefully drawn up, and it is believed cover all possible points on which the successful racing for the cup depends.

The Manhasset Race Committee for 1903 has just been appointed and consists, as last year, of E. M. Maclellan, Chairman; Charles D. Mower and Robert Jacob.

DECLARATION OF TRUST GOVERNING THE MANHASSET BAY CHALLENGE CUP FOR THIRTY-FOOT SLOOPS.

This intrument, dated October, 1902, made by the Manhasset Bay Y. C., a corporation duly organized and existing under and by virtue of the laws of the State of New York, witnesseth as follows:

The Cup.

The Manhasset Bay Y. C., having offered a perpetual challenge cup, to be known as the Manhasset Bay challenge cup, for the promotion of small yacht racing and the development of amateur seamanship, hereby sets forth and declares the terms and conditions which shall govern the tenure of the said cup and the competitions therefor.

ARTICLE I.

Clubs Eligible.

Any organized yacht club in good standing, of any country, shall always have the right to challenge for the cup and to sail a match therefor; provided such challenge shall be made and such races sailed in accordance with the terms and conditions of this instrument.

ARTICLE II.

Yachts Eligible.

Matches for the cup shall be limited to yachts propelled by sails only, whose racing measurement shall qualify them to enter in the 30ft. sailing length sloop class, of the Yacht Racing Association of Long Island Sound, as such classification exists on the date of this instrument, or such equivalent classification as said Association may in future adopt. The construction of said yachts shall be in accordance with the Definition and Table of Scantlings, and any other requirements of the Yacht Racing Association of Long Island Sound for such class as in force on the date of this instrument, or such definition and table of scantlings and other requirements as said Association may in future adopt, provided, however, that any yacht in existence Dec. 1, 1898, that is of substantial construction, conforming practically to said table of scantlings, shall be considered as in accordance therewith.

ARTICLE III.

Rules Governing Matches.

Matches shall be sailed under the rules of the Yacht Racing Association of Long Island Sound, of the year in which the match is sailed, except as hereinafter modified.

ARTICLE IV.

Crews.

The crew of each yacht sailing in a match shall number not to exceed five persons, including the helmsman, at least four of whom shall be amateurs and members of a recognized yacht club. The helmsman shall be an amateur and a member in good standing of the club whose yacht he sails.

ARTICLE V.

Season for Sailing Matches.

The club holding the cup shall defend it between June 15 and Sept. 15 against all challengers, under the conditions as set forth by this instrument.

ARTICLE VI.

Form of Challenge—Time Limit of Filing.

All challenges shall be in writing, signed by the proper official or officials of the challenging club. To insure a contest, one challenge must be delivered by April 1. Subsequently other clubs may challenge and enter the same contest on the terms proposed and accepted in the first challenge received; but no other challenge shall be accepted if received later than May 15.

ARTICLE VII.

Number of Races, Courses, Starts, Winner of Match, Naming Representative, Measuring, Hauling Out, Protests.

A match shall be constituted of not less than three or more than five races.

(a) Courses shall not be less than 15 nautical miles in length, nor more than 22 nautical miles, and shall be laid as nearly as possible as follows: The first race shall be to windward or leeward and return. The second race shall be over a triangle, one side of which shall be to windward. Subsequent races shall alternate as above until the series shall have been finished. A change of wind, occurring after the start has been made, shall not invalidate a race.

(b) All courses shall be laid in waters of suitable depth for the competing yachts, and of sufficient expanse to permit of each leg of each course being not less than three miles in length.

(c) The start shall be a one-gun flying start, with a preparatory

signal, and shall be made between the hours of 1 and 3 o'clock P. M.

(d) The winner of the match shall be determined by the point system, as used by the Yacht Racing Association of Long Island Sound, whereby each yacht entering and finishing a race of a match receives one point for her entry and one additional point for each yacht which she defeats, the winner being that yacht scoring the highest aggregate number of points in all the races of the match.

(e) Each club whose challenge has been accepted, shall name its representative yacht for the series, the day before the first race.

(f) No club shall enter more than one yacht for the same series of match races.

(g) A yacht to be eligible to compete, shall be the bona fide property of a member or members in good standing of the club it represents.

(h) Yachts must be measured previous to a match by the measurer of the challenged club.

(i) No yacht entered for a match shall be hauled out or laid on shore within twenty-four hours preceding the first race or during the period of the races, except in case of accident and for necessary repairs. Any yacht so entered, which shall have been hauled out or laid on shore, must be launched at least twenty-four hours preceding the first race.

(j) Protests must be filed in writing with the committee within twelve hours from time of starting the race protested.

ARTICLE VIII.

Arrangement of Preliminaries and Details for a Match.

The club challenging and challenged club may by mutual agreement fix and decide all the terms and conditions of the match, whether relating to dates, courses, sailing directions, notices or any other matter whatsoever, pertaining to the match or preliminary thereto, any may also by mutual agreement waive for such match such of the provisions of this instrument as would otherwise govern the match or the preliminaries thereof, provided, however, that the consent in writing, signed by the Commodore and Secretary of the Manhasset Bay Y. C., under authority of sail club to such waiver, shall have first been obtained.

ARTICLE IX.

Modification of Agreement.

If deemed desirable, the terms of this agreement may be modified by the Manhasset Bay Y. C. while the cup is in its possession and when not in its possession by agreement between the Manhasset Bay Y. C. and the club having the custody of the cup; provided, however, that no modification shall be made during the pendency of any challenge, unless consented to by all the challengers.

ARTICLE X.

In case the club having the custody of the cup shall be dissolved or cease to exist, the cup shall thereupon revert to the Manhasset Bay Y. C., and shall continue to be subject to the terms and conditions of this instrument.

ARTICLE XI.

This instrument shall be executed in duplicate originals, one of which shall be preserved in the archives of the Manhasset Bay Y. C., and the other shall accompany and be delivered with the cup whenever won and transferred, and any club winning the cup shall, upon receiving the same, duly execute and deliver to the club from which the same is received, an acknowledgment substantially in the following form, namely:

Received this .....day of..... A. D.....
from the..... Yacht Club, the Manhasset Bay Challenge Cup for Thirty-Foot Sloops, awarded to the undersigned club, as the result of a match sailed at .....
on.....under the auspices of the.....
Yacht Club, on the days of....., which cup is delivered to the undersigned club, in pursuance of the terms of a certain instrument executed by the Manhasset Bay Yacht Club, of Nassau County, New York, under date of October 8th, 1902, and will be held by the undersigned club, subject to all the terms and provisions of said instrument.

.....Club.
By.....

In witness whereof the Manhasset Bay Y. C. has caused its corporate name to be signed hereto by its commodore, and its corporate seal to be hereunto affixed and attested by its secretary. All done in duplicate originals, as of October .., 1902.

Manhasset Bay Yacht Club.
(By ....., Commodore.)
Attest:....., Secretary.

YACHT CLUB NOTES.

At a meeting of the Pavonia Y. C., held recently, the following officers were elected to serve during the coming year: Commodore, C. F. Lynes; vice-commodore, Walter Wood; corresponding secretary, Howard Smith; financial secretary, William F. Tobin; treasurer, Louis Middlesdorf; measurer, A. Curtis, and trustees, William D. Salter and Colonel Charles Angens.

Last season the Ardsley Club organized a yachting department to be run in connection with the club. The yachting branch was a success from the start, and those interested have now formed the Ardsley Y. C., and the following officers have been elected: Commodore, Edwin Gould; vice-commodore, W. L. Bull; secretary, Nathaniel A. Campbell; treasurer, F. L. Eldridge; fleet captain, Clifford Buchanan; regatta committee, Philip Schuyler, chairman; Frank J. Gould, F. L. Eldridge and Robert Hewitt. The club now has eighty members.

At the last meeting of the board of directors of the California Yacht Club several sets of plans for the new clubhouse, to be built near one of the railroad moles, were presented for consideration. The design most likely to be adopted was suggested by ex-Commodore Allen M. Clay and was approved by the directors present at the meeting. The clubhouse will be two and a half stories high, in the colonial style, with a lighthouse tower containing a cluster of lights eighty-five feet above sea level. A veranda will run around the dome, from which a fine view will be obtained.

In the clubhouse there will be fifty lockers for yacht owners and 250 for members who do not own yachts. There will be space for storing eighty small boats and for a pumping-room, in which will be installed a motor to supply power for hauling yachts up on the ways.

A wide staircase will lead to the second floor, on which will be the reception hall and assembly-room, which will have a stage 37 by 18 ft. at one end. There will also be a parlor, dressing-room, rooms for the directors and for billiards and cards. Dressing-rooms will be adjacent to the stage. A large reading-room with a great open fireplace will lead off the assembly-room. The wide veranda will be open on one side and covered with glass on the other. The half-story on the top will contain a stewards' room and a sail loft.—San Francisco Call.

The Board of Governors of the Philadelphia Yacht Club, at Essington, have had plans prepared for extensive improvements to be made to the clubhouse. The drawings provide for alterations and additions, including two new bowling alleys, an electric lighting system, additions to the dining-room, swimming pool, and the servants' quarters.

Mr. Charles D. Mower has been nominated to fill the position of measurer of the New York Y. C., left vacant by the resignation of Mr. John Hyslop, who has held the office for many years past. Mr. Mower is also the measurer of the Yacht Racing Association of Long Island Sound, and of the Manhasset Bay Y. C.

YACHTING NEWS NOTES.

Some little impatience seems to exist among some of our readers, who are anxious to learn what has become of the Cruising Competition, and we are only now able to gratify this natural curiosity. It has taken time to read over the various accounts of cruises submitted, and to sort out those worthy of a place in the competition from others which were not so good. Of the number submitted, eight have been adjudged worthy to compete, but a decision as to the successful competitors must be delayed for some little time since the judge, Mr. Zerega, of the New York Yacht Club, is now in Europe, and the stories submitted must be sent to him for examination and placing. Meantime, we must ask the competitors and others to exercise patience.

Mr. Howard Gould's steam yacht Niagara sailed from New York on Dec. 10 bound for the Mediterranean. She reached Bermuda on Dec. 13.

OSSINING, N. Y., Dec. 12.—To the Members of the American Canoe Association: It is my sad duty to notify you of the death of your Secretary-Treasurer, Louis Simpson, of Yonkers, N. Y. He died there yesterday after a short illness of appendicitis.

His death is a great loss to his family, friends and to the A. C. A., where those who knew him had formed the utmost respect and affection for his sincere and lovable qualities.

During his membership in the A. C. A. his manner of action and life at our various meetings, in doors and in camp, has been a proper model and fine example for our members to follow:

I will extend our heartfelt sympathies to his family.

NATHANIEL S. HYATT.
Commodore of A. C. A.

Mr. Stanley W. Seaman has made the following sales: Auxiliary yawl Possum, sold by Mr. David Gregg, Jr., Jamaica Plains, Mass., to Mr. Adolph Erdman, New York City. Half rater Indian to Mr. Regis Post; Indian will be shipped at once to Bermuda, where her owner will use her during the winter.

Colonel Harry McCalmont, a well known British yachtsman, died suddenly at his residence in London on Dec. 8.

The Whitestone Hollow Spar and Boat Company has recently been incorporated. The corporation is capitalized for $200,000. The company's plant is now being built at Whitestone, L. I., and they will build hollow spars, yachts, launches, tenders, canoes, etc. The five directors who will serve the first year are: John G. Fraser, New York City; George B. Bidwell, New York City; John M. Dolan, Far Hills, N. J.; George Bullock, Cincinnati, O.; George S. Clay, Plainfield, N. J.

At the Marblehead Yacht Yard there is building a 41-foot waterline auxiliary yawl for Mr. J. P. Elton, who formerly owned Umbrina, a 35-foot waterline cutter that was designed and built at the same yard. The auxiliary will be the most elaborate and costly boat ever built by this firm. She will be fitted with fifteen horse power Standard engine. There will be two quarter state rooms aft with lavatories, toilet rooms, etc., connected with the port state room, a very large main cabin, combined galley and engine room separate from forecastle. All the joiner work aft will be of very choice mahogany which has been especially selected for this yacht. The floor frames will be of tobin bronze bulb angles. The deck and diagonal straps, chain plates, and in fact about all the wrought metal work in connection with the hull will be of tobin bronze. The plank and deck fastening will be of special drop forged tobin bronze nails, and for the keel bolts a new process metal is used which will have a tensile strength of 94,000 lbs. to the square inch, and is probably the strongest lot of bronze rod ever turned out in this country. The deck joiner work, covering board, rails, etc., will be of teak. Planking will be of hard pine, single skin, as the boat is designed for severe usage, and the single thickness of planking seems more advisable than double skin work. She will be very snugly canvassed and yawl rigged.

Other work contracted for includes some small launches for yacht dinghies, sailing tender for Mr. Gordon Dexter's Wasp, 25ft. speed launch for Mr. E. T. Bigelow, of Medford, and several other boats.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 17-18.—Spirit Lake, Iowa.—Gilbert and Burmister, amateur target and live bird tournament.

Dec. 25.—Dover, N. J.—Holiday live-bird shoot of the Dover Gun Club. Bull shoot the special event.

Dec. 25.—Interstate Park, L. I.—John S. Wright's target tournament, sweepstakes, etc.

Hell Gate Gun Club's shoot, fourth Tuesday of each month (July and December excepted), at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Hell Gate Annex shoot, second Friday of each month (January and July excepted), at Dexter Park, Brooklyn.

Brooklyn Gun Club's shoot, Saturdays, at Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

South Side Gun Club's shoot, Saturdays, South Broad street, Newark, N. J., near Lehigh Valley coal depot.

Outwater's grounds, Carlstadt, N. J., Saturdays, live-bird handicaps.

1903.

Jan. 1.—Poughkeepsie, N. Y.—Inter-county shoot and tournament of the Poughkeepsie Gun Club. Max Condit, Capt.

Jan. 1.—Paterson, N. J.—Open live-bird shoot of the Jackson Park Gun Club.

Jan. 1.—Rutherford, N. J.—New Year's Day target shoot of the Boiling Springs Fishing and Gun Club. C. B. Axford, Sec'y.

Jan. 1.—Interstate Park, L. I.—New Year's Day target tournament.

Feb. 9-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club. Percy S. Benedict, Sec'y.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 9-11.—Cincinnati, O.—Seventeenth annual tournament of the Ohio Trapshooters' League. Chas. F. Dreihs, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

Mr. John S. Wright, 318 Broadway, has issued the programme for his shoots, to be held on Christmas and New Years, at Interstate Park, Queens, L. I. The programme is alike for each shoot. There are eight events, of which three are at 15, one at 20, and a 100-target handicap, divided into four events of 25 targets each, $2 entrance. Handicaps, 14 to 23yds. All moneys divided Rose system, except the optional 100-target event. Targets, 2 cents. Any one who desires, may shoot for targets only. Shooting commences at 10:30. Trains leave Flatbush avenue at 7:50, 9:19 and 10:58 A. M.; 12:18, 1:48, 2:45 and 4:23 P. M. Leave Thirty-fourth street at 7:50, 9:20 and 11 A. M.; 12:20, 2, 2:50 and 4:30 P. M. Trains leave the park at 7:05, 7:43, and 10:52 A. M.; 12:16, 1:54, 3:26, 4:52, 5:52, and 6:52 P. M.

That the Interstate Association has lost none of its energy and effort is evidenced by the broad programme which it contemplates following in target tournaments for 1903. Checked in the great live-bird competition, the Grand American Handicap at live birds, it turns to the cultivation of the broad field of target tournaments. It will give two Grand American Handicaps at targets, the fourth one in April at Blue River Shooting Park, Kansas City, the fifth one probably in May at Interstate Park, L. I. To each $1,000 will be added. These will be Interstate Association tournaments exclusively. Numerous others will be given for the benefit of clubs in different sections of the country. A number of applications have been received, and the following have been favorably considered: Boston (Mass.) Shooting Association, Akron (O.) Gun Club; Viroqua Wis.) Gun Club, Rainmakers' Gun Club, Ottawa, Ill.; West Branch Rod and Gun Club, Williamsport, Pa.; Meriwether Gun Club, Warm Springs, Ga.; Chautauqua County Gun Club, Dunkirk, N. Y. Mr. Elmer E. Shaner was re-elected to the office of manager, which he has filled with conspicuous ability and success for many years.

In behalf of the Hell Gate Gun Club, of New York, Col. John H. Voss, the president, and Mr. E. Doenick, the secretary, whose address is 1355 Amsterdam avenue, have addressed a circular letter to the club members as follows: "On account of our shoot falling two days before Christmas, and this being very inconvenient for business men, the executive committee considered it best to hold a shoot the week before, and it is hereby called for Tuesday, Dec. 16, at 12 M."

The members of the Hell Gate Gun Club of New York, will celebrate their tenth anniversary and beefsteak dinner at 521 and 523 West Fifty-seventh street, New York, Dec. 18, at 8:30 P. M. This is exclusively a club function. The club has a numerous and active membership, marked by admirable good fellowship, so that there is no doubt but what the tenth anniversary will be celebrated by the club's full membership.

Mr. R. O. Heikes, with his son Horace, left New York on Saturday of last week for his home in Dayton, O., after a two weeks' visit in New York and Bridgeport, Conn. "The Daddy of Them All" was looking in perfect gladiatorial form, and in 1903 there is no doubt but what he will be shoulder to shoulder with the leaders in trapshooting competition.

The match shot last Saturday at Paterson, N. J., on the grounds of the Jackson Park Gun Club, between Count C. A. Lenone and Mr. A. Bunn, 25 birds each, was won by the latter on a straight score, his opponent losing five, of which two were lost dead out.

In May, 1903, the Nebraska State Sportsmen's Association will hold its twenty-seventh annual tournament under the auspices of the Lincoln Gun Club, of which Mr. T. E. Mockett is secretary.

Mr. Chas. F. Dreihs, the secretary, writes us as follows: "The Ohio Trapshooters League will hold its seventeenth annual target tournament at Cincinnati, June 9, 10 and 11, 1903."

BERNARD WATERS.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Dec. 13.—There was a wintry storm in action, yet it did not deter the regular shooters of the Crescent Athletic Club from engaging in their weekly shoot. For the December cup there was a tie between Messrs. H. B. Vanderveer and D. C. Bennett on 45. The scores:

December cup, 50 targets, handicap: H. B. Vanderveer (3) 45, D. C. Bennett (4) 45, G. G. Stephenson, Jr. (2) 43, F. B. Stephenson (1) 42, L. C. Hopkins (6) 41, L. M. Palmer, Jr. (2) 39, F. T. Bedford, Jr. (3) 37, Dr. Pool (3) 37.

Trophy, 25 targets, handicap: F. B. Stephenson (1) 24, H. B. Vanderveer (3) 22, D. C. Bennett (4) 22, G. G. Stephenson, Jr. (2) 21, L. M. Palmer, Jr. (2) 20, Grant Notman (4) 19, L. C. Hopkins (6) 19, Dr. Pool (3) 16, F. T. Bedford, Jr. (3) 14.

Trophy, 15 targets, handicap: F. B. Stephenson (0) 12, L. C. Hopkins (3) 12, J. M. Palmer, Jr. (1) 11, G. G. Stephenson, Jr. (1) 9, H. B. Vanderveer (1) 8, E. B. Knowlton (2) 8, C. H. Chapman (4) 7, Dr. Pool (2) 6.

Shoot-off, same conditions: F. B. Stephenson (0) 15, L. C. Hopkins (3) 14.

Brooklyn Gun Club.

Brooklyn, L. I., Dec. 13.—Notwithstanding the wintry weather, seven events were shot off at the Brooklyn Gun Club's shoot to-day, of which J. S. Wright is manager. The highest scores were made by Mr. H. S. Welles. No. 3 was at 10 singles and 5 pairs. No. 5 was at 5 pairs:

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	15	25	20	20	10	Targets:	15	25	20	20	10
J B Ainslie	7	..	..	..	..	Capt J N Borland	..	20	9	16	8
H S Welles	15	21	18	19	10	Dr O'Callahan	..	12	6	..	..
S Poder	12	..	..	..	7	I Marshall	..	..	16	17	10
J S Wright	6	14	13	12	4	W J Borland	..	..	14	16	..
A Kissel	3	..	..	..	..						

Cincinnati Gun Club.

CINCINNATI, O., Dec. 6.—The twenty-fifth contest for the Cincinnati Gun Club's cash prizes, resulted as follows: Medico (17) 44, Parker (17) 43, Ahlers (19) 42, Gambell (19) 42, J. B. (17) 40, Coleman (19) 39, Dreihs (17) 39, R. Trimble (22) 39, Capt. (18) 39, Roll (17 38, Barker (17) 38, Block (18) 37, Falk (16) 36, Littleford (17) 36, Osterfeld (18) 34, Herman (18) 34, E. Trimble (18) 33, Corry (17) 33, du Bray (22) 32, Van Ness (19) 32, Ackley (16) 29, Boeh (15) 27, Roanoke (22) 26.

Changes by to-day's scores are: Medico advances from eleventh to eighth place; Gambell advances to third place; Randall drops to fourth place; Block drops to tenth place; Van Ness drops to ninth place. Ahlers and Coleman improved their scores by 1.

Match, team race, 50 targets per man, 20yds.:
R. Trimble 47, Gambell 43; total 90.
Ahlers 43, Medico 38,; total 81.
No. 2, same: R. Trimble 46, Gambell 42; total 88.
Ahlers 43, Medico 38; total 81.

S. S. White Gun Club.

GORGAS STATION, Pa.—There was a good attendance, notwithstanding the bad weather, twelve shooters participating. Dr. Cotting was high in the club shoot at 25 targets. For making the highest possible scores in the last six months, T. E. Hinkson was awarded the silver loving cup, donated to the club by W. F. Parry, Jr. The scores:

Club event, 25 targets, unknown angles: Dr. Cotting 19, H. Wilkins 18, Contrell 17, Harper 17, Denham 16, Witherden 15, Kendall 15, Robinson 14, Hinkson 12, Heite 12, Parry 8, Hise 6.

The sweepstakes were at 10 targets, unknown angles:

First event: Hinkson 7, Witherden 7, George 5, Dr. Cotting 5, Parry 5.

Second event: Hinkson 8, George 8, Cotting 7, Denham 5, Parry 3, Witherden 3.

Third event: Hinkson 7, George 7, Curry 6, F. Hise 4, H. Hise 3.

Nonpariel Gun Club.

CHICAGO, Ill., Dec. 13.—At Watson's Park, Burnside Crossing, to-day the Nonpariel Gun Club held a regular shoot, at targets, the scores of which follow:

JOHN WATSON.

Interstate Association's Annual Meeting.

THE annual meeting of the stockholders of the Interstate Association was held at Oakland, N. J., on the morning of Dec. 11 last, but was adjourned later to the offices of the Laflin & Rand Powder Company, 99 Cedar street, New York, where the meeting was again called to order at 2 P. M., with President J. A. H. Dressel in the chair. Every company that is a stockholder in the Association was represented at the meeting, among those present being Mr. J. A. H. Dressel, of the U. M. C. Co.; Capt. A. W. Money and Mr. Edward Banks, of the American E. C. & Schultze Gunpowder Co., Ltd.; Mr. Irby Bennett, of the Winchester Repeating Arms Co.; the Hazard Powder Co. and E. I. du Pont de Nemours & Co. were represented respectively by Mr. John L. Lequin and Mr. E. S. Lentilhon, while Messrs. Eugene du Pont and R. S. Waddell, both of the Dupont Co., were also in attendance, as were Mr. A. W. Higgins, of the Laflin & Rand Powder Co.; Mr. W. F. Parker, of Parker Bros.; Mr. J. H. Marlin, of the Marlin Fire Arms Co., and Mr. T. H. Keller, of the Peters Cartridge Co. Messrs. Tatham & Bros., Leroy Shot & Lead Works, Remington Arms Co., Hunter Arms Co., and Markle Lead Works were all represented by proxy.

After the general routine business, the report of the Association's manager, Mr. Elmer E. Shaner, was read, the report being subjoined.

In accordance with Mr. Shaner's suggestion it was decided to change Section 5, Rule 21, of Target Rules so that it now reads that "the targets shall be thrown from unknown traps."

Mr. Lentilhon, who has for several years represented Messrs. Dupont & Co. at all meetings of the Association, announced that his place would in future be filled by Mr. Eugene du Pont. That Mr. Lentilhon's late colleagues appreciated his services is shown by the fact that by unanimous vote honorary membership in the Association was tendered to him, an honor hitherto not bestowed upon any individual. Before adjourning, the stockholders of the Association elected a board of five directors, who in turn elected the officers for 1903. The five directors were: Messrs. Dressel, Bennett, Banks, Higgins and du Pont.

The following officers were then elected: President, J. A. H. Dressel; Vice-President, Irby Bennett; Treasurer, A. W. Higgins, and Secretary, Edward Banks, the latter accepting the office only on the condition that his term of office last until Dec. 29 next, when a proposed change in the by-laws would permit of the appointment of another secretary who need not necessarily be a member of the board of directors, as is now made compulsory by the by-laws of the Association. Mr. Banks has held the dual position of secretary-treasurer of the Association for four years, having been elected to that office in December, 1898. It is perhaps unnecessary to state that Mr. Elmer E. Shaner was unanimously selected to again fill the position of manager, this being his twelfth term of office.

The following committees were then appointed:

Executive Committee: Mr. Edward Banks, Chairman; Messrs. Eugene du Pont and Irby Bennett.

Tournament Committee: Mr. Irby Bennett, Chairman; Messrs. Tatham, Banks, Parker, Lequin, Marlin, Higgins and du Pont.

Club Organization Committee: Mr. T. H. Keller, Chairman; Messrs. Delano, Markle and McMurchy.

After the stockholders and the board of directors had held their respective meetings, the Tournament Commitete went into session, Mr. Bennett in the chair. All the members, with the exception of Mr. Charles Tatham, were present. President J. A. H. Dressel and Manager Shaner were also present. It was decided to hold two Grand American Handicaps at targets during 1903, to be known respectively as the Fourth and Fifth Grand American Handicaps at targets. It is proposed, providing satisfactory arrangements can be made, to hold the Fourth Grand American Handicap at targets at Blue River Shooting Park, Kansas City, Mo., some time during the month of April. The Fifth Grand American Handicap at targets will be held at Interstate Park, Queens, L. I., N. Y., probably during the month of May. The Association will add $1,000 to the purses at each of the above tournaments.

Manager Shaner presented a long list of applications from gun clubs and State organizations for tournaments during 1903, to be given under the auspices of the Interstate Association. From the number presented seven were chosen, as follows: Chautauqua County Gun Club, of Dunkirk, N. Y.; Meriwether Gun Club, of Warm Springs, Ga.; West Branch Rod and Gun Club, of Williamsport, Pa.; Rainmakers' Gun Club, of Ottawa, Ill.; Viroqua Rod and Gun Club, of Viroqua, Wis.; Akron Gun Club, of Akron, O.; and Boston Shooting Association, of Boston, Mass. Two other tournaments will also be given by the Association at points not yet decided upon.

Mr. Shaner's Report.

Pittsburg, Pa., Dec. 10, 1902.

To the President, Officers and Members of the Interstate Association:

Gentlemen—It gives me much pleasure, in submitting the report of the work of the manager's office for the season of 1902, to be able to state that our sky is still unclouded and that the storm raised of late by the emotionalists has but served to establish the organization of the Interstate Association more firmly in the affections of rational men who understand its aims and scope. Like the monarch of the forest, the shaking of its roots has only caused them to take a stronger hold on intelligent public opinion.

At the risk of appearing monotonous, I am again impelled to repeat that another successful season has again been the most successful. Trapshooting continues to grow in favor in every section of the country, and its friends cheerfully recognize the Interstate Association as its progenitor and give honor where it is due. This was strikingly shown by the fact that during the season of 1902 the majority of tournaments were governed by the revised trapshooting rules of the organization, and while there were fewer large tournaments than in former years, there were many more small ones of two and three days' duration, thus extending interest over larger sections of the country.

Grand American Handicap Tournament at Live Birds.

As usual, this was the opening event of the year, and it was significant in showing the wisdom of the change from the East to the boundless West, whither the star of empire has been tending for centuries. It was held at Blue River Shooting Park, Kansas City, Mo., March 31 to April 5, and the entry list was phenomenal—more than justifying prediction as to advisability of change of base. The entries numbered 493, with 456 actual starters, surpassing all former records by more than 200 entries. Only those actually engaged can fully appreciate the enormous task of carrying the gigantic enterprise to a successful terminus. It was up to date, and subject matter for comment by all our sporting journals, and it has ever since furnished a conversational topic to the fraternity. It might be well, however, to ponder the objections raised by experts on the sporting journals to the immensity of such tournaments. Many will agree with them that notwithstanding its success, the scale was too extensive to obtain the best results possible. On this head of course, there is room for honest contention. Tournaments of such magnitude undoubtedly tax the resources of even the Interstate Association to the utmost, and success is only attained by herculean exertion, The suggestion that a higher entrance fee, more birds to shoot at, and more severe handicaps, would have greater public significance than opening of the list to all manner and condition of shooters, is worth careful consideration. There is no pessimism in the suggestion, or hint that the Association has so far overtaxed its powers; the result negatives that supposition. Labor omnia vincit.

Inanimate Target Tournaments.

The third annual Grand American Handicap target tournament at Interstate Park, L. I., May 6 to 9, was a pleasant affair, detached from all accessories, and was a drawing magnet for target shooters. The fact that the targets were inanimate did not detract from the interest, and the tournament was a triumph from opening to close. There was a larger number of entries than for its predecessor in 1901, and many of these were of the staying class, shooting throughout the entire programme each day. As the programme of 1901 had been a success, that of 1902 was framed on the same general plan, with equally gratifying results. The shooting was, on the whole, good, and the handicapping gave as much satisfaction as could be expected. The distance handicap was regarded by experts as the best, giving to all classes of contestants terms on which they could compete most satisfactorily and fairly. From beginning to end, the tournament ran smoothly, there being no hitch of consequence.

The tournament given for the Charleston-Palmetto Gun Club at Charleston, S. C., May 14, 15 and 16, was enjoyed by all, whether participants or spectators. On the first day forty-eight contestants entered and twenty-eight shot through the programme. The interest was fully maintained the second day, there being the

same number of entries. The attendance the third day was also good, and it was the general verdict that the Interstate Association's methods are all that can be desired in these events.

Some of the foremost professional and amateur shots in the Union competed in the tournament given under the auspices of the Memphis (Tenn.) Gun Club, on July 10, 11 and 12. Contestants came to shoot, and the competition was keen and unflagging. There were more than sixty contestants. Visitors were well taken care of by the Memphis Club, and not the least of the attractions was an old-time Southern barbecue dinner, which sustained energy each day, and the man who didn't enjoy it had villiainously poor digestion.

Although attendance at the Raleigh (N. C.) Gun Club's tournament, June 25 and 26, was not as large as anticipated by the local club, the loss was that of absentees, for the sport was good and those present felt that it was good to be there. The club is three years old, and its strenuous life shows that it will continue to grow. Its grounds are splendidly equipped and less than ten minutes' ride from the Capitol by the car line. Here the members practice each Thursday afternoon, which insures proficiency. At the conclusion of the regular programme the second day, the Raleigh Gun Club gave a $50 purse, open to all except themselves, without entrance fee. The handicap was by distance. This liberality won the hearts of all visitors, and made them reluctant to say, "Good-by."

The tournament held at Titusville, Pa., July 16, 17 and 18, under the auspices of the Titusville Gun Club, though no more successful than anticipated, was up to the mark. This was expected, for though the club is less than two years old, its members have steadily exhibited the qualities that make success certain. The personnel of the club is first class. It contains the cream of the city, business and professional men, noted for esprit and hospitality cheering to the hearts of visitors. The shooting grounds are a mile west of the city limit, and reached by a ten-minutes' ride on the electric cars. Nature was prodigal in furnishing a beautiful site on the margin of historic Oil Creek. A neat, commodious and convenient club house was built for the accommodation of visitors, and nothing to be desired was omitted. Though a strong western breeze was discommoding on the opening day of the tournament, the weather was on the whole satisfactory. The brisk wind made shooting difficult at times, as the targets were erratic. The man who was disappointed in this tournament was a misanthrope whom it would be folly to attempt to placate.

The tournament at Marietta, O., on Aug. 6 and 7, under the auspices of the Columbian Gun Club, one of the oldest in the Buckeye State, was expected to fill its usual girth, and it is scarcely necessary to say more than that it did. But three manufacturers' agents took part in a field of between thirty and forty contestants. The club house and shooting grounds are at the Fair Grounds, on the Muskingum River, well shaded and within ten minutes' ride by trolley line from the heart of the city. Contestants represented all parts of the country, and they were well pleased with the entertainment afforded by the club. The first day was fine, nothwithstanding a couple of showers, which delayed the finish. The second day was like that "perfect day in June" about which poets rave, and all in all, the affair could scarcely have been improved on.

Brunswick, Me., redolent of a century of Bowdoin College, Longfellow and Mrs. Harriet Beecher Stowe, Uncle Tom's Cabin, etc., was not too transcendental to get up a splendid tournament under Interstate Association management on Aug. 13 and 14. The club is but little more than a year old, but it has already about 100 members, and it is indefatigable in its proceedings, and had every requisite for comfort on its grounds at Merrymeeting Park. The attendance of contestants was lessened by the fact that the closing tournament between Maine and Massachusetts was held on the 11th and 12th at Auburn, Me., and this city being but nineteen miles distant, necessarily divided the enthusiasm.

The tournament at Haverhill, Mass., Aug. 27 and 28, was, like all similar events the Interstate Association provides, up to the high standard of excellence the public has grown to expect. The entries for some unaccountable reason were not up to the expectations of the Haverhill Gun Club. The club has a membership of sixty, and has on its roll many successful business and professional men. Its arrangements are strictly up to date. The shooting grounds and club house are at Hoyt's Grove, some two miles from the center of the city and accessible by two lines of electric cars. Thirty-four contestants came to the scratch each day, about half of the number expected. The shooting was good, and much credit for the success of the tournament is due to the committee which had the immediate charge of same.

The success of the tournament at Nappanee, Ind., Sept. 3 and 4, under the auspices of the Nappanee Gun Club, was marred by the jealousy of other gun clubs, who persisted in holding tournaments on the same days and in the same State. This regrettable opposition caused injury to the Nappanee tournament, not only in the matter of general attendance, but in entries also. The club, however, is made of the right stuff, and did not allow its interest to flag in consequence, and the programme, as advertised, was fully carried out. The grit of the club is commendable, and it will eventually reap success in due time. It is a young organization, and exhibits zeal worthy of a better fate.

The closing tournament of the year was held at Lewistown, Ill., Sept. 29 and 30, under the auspices of that club. Others would do well to emulate that of Lewistown in the matter of working up attendance, and preparing preliminary details which are of more importance than some people seem to think. If you have a good thing in this country there is nothing more necessary to success than letting it be known. No fear of the frown of public disapproval. People want to know what you have got, and they don't want, and will not take, much trouble to find it out for themselves. "If your foot is pretty, show it."

The Future.

The outlook, so far as inanimate target shooting is concerned, is roseate—never better. The sport has increased in popularity in all parts of the country, its meritorious features being developed by the Interstate Association's work in its tournaments, and the members can congratulate themselves that their good "works do follow them, even" into the byways where much spirit is often nascent and needs only a little stimulation to cause it to bloom. All this is very encouraging and pleasing to contemplate.

Grand American Handicap at Live Birds.

At a special meeting of the stockholders of the Association, called for the purpose of considering the advisability or otherwise of holding this great event during 1903, it was the unanimous sentiment of the meeting that it would be advisable not to give a Grand American Handicap at live birds in 1903. My views on the subject were fully set forth at that meeting, and it is unnecessary to repeat them at the present time.

Fourth Annual Grand American Handicap Target Tournament.

This tournament has grown steadily since it was established, and promises to be in the near future as firm a fixture as the Grand American Handicap at live birds. It would seem to be wisdom to adhere to a similar programme of events as in former years, as the distance handicap appears to equalize contestants better than any other before the public at present. At least it gives satisfaction to a large majority of competitors, which is and always has been our aim.

Inanimate Target Tournaments for 1903.

The Union is all before us to choose where we will. We have applications from all sections. For a large part of the season, at least, we should work in the middle West. The West goes into such matters with so great zest that it not only deserves encouragement, but promises for a long time to be the most profitable. If people there were born gun in hand they could not be more enthusiastic, and the uppermost feeling they always excite is that it is good to be with them. It is not altogether business with them, as sentiment always buttresses business so largely as to relieve operations considerably of materialistic flavor. The West has not been appreciated as it should be. Tournaments should not follow so closely as during the season of 1902, and the entire circuit should be mapped out early in 1903, in order to achieve best possible results.

Trapshooting Rules.

I respectfully suggest the following change in the inanimate target rules, as revised in 1902: Change Section 5 of Rule 21 (Sergeant system) to read as follows: "The targets shall be from unknown traps." This suggested change accords with the system, as understood and enunciated by its inventor, Mr. W. G. Sergeant, of Joplin, Mo. During the season just closed, the rule of "known traps" caused many disputes, and caused delays in shooting on numerous occasions. While one squad of five men shot at 15 targets, I have known the shooting to be delayed as often as twelve times while contestants paused to ask "What trap do I get?" In addition to this objection, a dishonest contestant can take advantage in many ways under the rule of "known traps," and it should be, and I know is, the aim of the Interstate Association to discourage and when possible prevent anything savoring of unfairness.

Conclusion.

Allow me, in taking my adieu of 1902, to thank the Interstate Association for its kindness to me in person, making the intercourse more pleasant as each year goes to join the past, and ever cementing the tie more strongly, and in this connection I would join the sportsmen's journals, both for their support of the Association and for myself as well. Last, but not by any means least, I want to render full recognition and thanks to our subscribers for the unflagging interest they have taken in our work. Very respectfully submitted,

ELMER E. SHANER, Manager.

Progress in Gunmaking.

THOSE who endeavor to trace the present-day developments of the shotgun are generally at a loss to name any improvement now in course of adoption which can be compared with those that mark the difference between the modern ejector and the older hammer gun, or even muzzleloader. Most persons seem satisfied to regard the single trigger as the only present day development of any great importance, and doubtless they are right, in so far that one or other of the practical systems in vogue seems well adapted for the purpose in view, while the shooters using them appear to appreciate the added convenience. Granting the virtual impossibility of a stay in the process of development of firearms, one is bound to look in other directions than the system of trigger action to discover such changes as may be taking place in the construction or style of modern shotguns.

A good deal depends upon which type of firearm is to form the basis for consideration. If one takes a best gun by one of the leaders in the trade really having the name for turning out a superior article, the task of instituting a comparison is quite different from what it would be if the same process were applied to medium quality guns, such as are sold in considerable quantities all over the country. To simplify matters, it will be best to review both classes of firearm from the standpoint of their development as compared with a period running some years back. In the first place, it cannot but be noticed that the improvements in modern machinery have influenced in a great measure even such a marked example of hand work as the best gun. The machining of the actions in the earlier stages of their construction, and the formation of the various surfaces and recesses, have been greatly influenced by the more exact methods which are now available in the production of every class of manufactured goods. The saving of cost and the increase in efficiency very naturally make it possible for the concientious gunmaker to put an enhanced quality of work into those parts which most need it. A hole is none the less a satisfactory piece of workmanship because it has been drilled true to position and dimensions by modern methods. Conversely, a hole that has been shaped out by the old-fashioned fiddle drill, or by an out-of-date lathe may have cost much more money, and demanded a greater amount of skill in the workmanship, without being any better done; as a matter of actual fact, it is probably inferior in several respects. Again, in the formation of the various flat surfaces of a gun the working of a milling cutter, while imparting a high degree of finish and accuracy, must be cheaper and, at the same time, more effective for the end in view. Therefore, as time has gone on, and one manufacturer after another has possessed himself of an improved grade of appliances, the quality of the work done has shown a proportionate tendency to develop in the right direction.

In entering into the details of construction of a best gun one is not disappointed when looking for improvements upon methods that were in vogue a decade or so ago. The most marked change is, of course, in the enhanced substantiality of design and constructing of the various working limbs of a gun. A working part that was years ago adjusted by laborious hand process is now adjusted the same way, but the difference that exists is that, while the adjustment in years gone by required to take into account want of trueness in the positions of the engaging surfaces relatively with one another, such differences are now greatly minimized. As the capacity to repeat the exact form of a given limb has been increased, so its design has been, bit by bit, more closely harmonized with the work put upon the various bearing surfaces. The effect of such a development as the alteration of a center or pivot by the sixty-fourth of an inch cannot be expressed in a very definite way, but in practice it must tend to reduce the number of casualties liable to occur in the wear and tear of constant use. In this way the ejector of to-day is a much more satisfactory article than the ejector of ten years ago, and as time goes on, the weaknesses occasionally met with will gradually be eliminated.

Turning from the mechanical parts to the general construction of the weapon, one cannot help being struck by the remarkable combination of strength and lightness that is typical of the modern best gun. When one hears of 12-bore barrels weighing 2 pounds 14 ounces, it is difficult offhand to realize the mechanical ingenuity that must be exercised to obtain the necessary margin of strength with such a small amount of metal available. The fact remains that this is done, and many a pair of barrels weighing this amount are of greater all-round strength than others 4 ounces, 6 ounces, or 8 ounces heavier. It is not certain that modern machinery has done very much of late years to perfect the manufacture of shotgun barrels. Certainly the development of steel in place of Damascus has created certain radical changes in the methods by which the rough bored tubes are produced, though even now one cannot help being struck by the apparent longevity of the appliances employed in the production of the very best grade of work.

Among the marked changes in the practice of shooting is, of course, the increase of driving as against shooting over dogs, and it is this development which has influenced very largely the construction of the most modern gun. Lightness and handiness of balance have to be combined with a solidity that will not give way before the constant concussion of heavy days of shooting repeated throughout the season, while at the same time the stock must be so shaped as to satisfy the shooter that he is not handicapped by a badly fitting weapon. Under these conditions it is possible to lay down with a fair amount of certainty that the latter day development of the sporting shotgun has all worked in the direction of affording a light, perfectly balanced weapon, capable of standing an amount of wear and tear that few shooters were able to give to their guns in years gone by. When, however, we turn to the cheaper class of shotgun it will be found that the transition is far more marked. The refinements of construction that have previously been limited to those paying the highest prices have gradually been brought within the reach of the man with a modest purse. It is now possible to buy a hammerless ejector single trigger gun for a matter of £25, and it must not be forgotten that such a thing would have been thought well nigh impossible some years ago, taking into account the solidity of workmanship that can be guaranteed at the price.

Unfortunately, the development of the medium quality gun is very unevenly distributed. Some firms have advanced very much further than others, and the sportsman can hardly be expected to differentiate upon casual examination between what is really sound and well worth the price offered, and that which is likely to be a trouble and a disappointment. It is easy enough to get the best for the best price, but the pitfalls that are encountered in trying to get value when buying a medium quality of gun are very considerable. At the present time we believe that the mechanism of the less expensive grades of gun is in many cases far ahead of the boring of the barrels. The recent efforts to secure standardization of the cartridge chamber have shown how many gunmakers there are who have not paid adequate attention to this detail of their work. It is probably one of the unfortunate traditions of gunmaking that the action filer chambers the barrel and forms the cone therein, while the barrel borer does the rest of the inside and the whole of the outside of the tubes. An actioner cannot possibly acquire the perfection of training that enables one accustomed to looking down barrels to appreciate absolute trueness in the chamber and cone. Furthermore, his appliances are hardly of the kind that seem best adapted for the work. When it is realized that the ordinary brace is the favorite instrument for doing much of the work on the chamber, it will not be surprising that so many guns show evidences of bad formation of the chambers. One cannot help believing that the most urgent requirement in the modern shotgun, whether of the best or a medium quality, is a more satisfactory formation of the chamber and the boring of the barrels truer to the nominal standards than is at present the practice, and it is in this direction that we would now look for an immediate advance toward improved all-round efficiency.—Field (London.)

IN NEW JERSEY.

Jackson Park Gun Club.

Paterson, N. J., Dec. 13.—Jackson Park Gun Club's open shoot brought out several visiting shooters, who braved the storm to get here, but could not get brave enough to go out before the traps. The Lenone-Bunn match was started about 1:30 in a snow and hail storm, almost blinding and a very strong wind from the northeast came with it, bringing the birds to the left of the club house.

Count Lenone fared quite badly. His gun went off twice while bringing it up, on his first and nineteenth birds. He did not try for his twenty-fifth bird. Bunn shot in quick time, and used good judgment, getting them all.

Two 5-bird sweeps were shot after the match.

The birds were of an ordinary lot. Sim Glover and J. W. Hoffman and several other gentlemen were here, but did not shoot. Capt. Lenone declared shoot off for the day.

DUTCHER.

Hudson Gun Club.

Jersey City, N. J., Dec. 14.—Following are the scores made at the last regular semi-monthly shoot of the Hudson Gun Club. The day was bitterly cold, with snow on the ground and a strong wind blowing. Straight scores were hard to make. The real features of the day were the number of shooters present from the Fulton Gun Club, of Brooklyn, and the close race for programme honors between Glover and Schorty. Scores:

PUBLISHERS' DEPARTMENT.

Why Many Ladies Go to Pinebluff, N. C.

Ladies like to be considered pretty with a soft delicate skin and a healthy complexion, and it has proved beyond a doubt that the bathing in pure water will improve the skin to a greater extent than the use of any balm or mixture yet gotten up. Rain water is good, and many ladies bottle the rain water and keep it for that purpose. The water at Pinebluff is nothing but rain water filtered through the huge mounds of sand that were left piled up hundreds of feet high when the ocean receded from that section thousands of years since. The water is so soft and pure than by washing in it it imparts to the skin health and life, and by constantly bathing in it and keeping the face and hands wet the skin takes on a softness and tint that nothing else can impart. Elderly people who from age have lost that freshness can, by a few months' use of the water, regain much of the youthful appearance. There has become a demand for the water by those who cannot afford to go South, and it is shipped North from Pinebluff. Many Northern people have settled at Pinebluff permanently, until it is really a New England city with city government. Many persons are growing fruits, vegetables and raising poultry. Pinebluff is the home of Mr. John T. Patrick, of the Seaboard Air Line Railway, the great railroad that makes such quick time between Boston, New York, Philadelphia, Baltimore, Washington and Richmond to Pinebluff, Southern Pines, Pinehurst, Savannah, Tampa and Jacksonville, Fla.

The Peters Cartridge Co., of Cincinnati, O., has issued a superb calendar for 1903, which presents a particularly striking scene, representing dawn in the wild fastnesses of gameland. In the background are mountains, with the sun breaking forth over their tops. In the foreground is a large bull moose drinking at the lakeside, while on the right a deer stands, startled by a flock of mallards taking flight. Also in the foreground there are a fine cock grouse, and a bevy of Bob White. The scene is entitled "Dawn of a New Era," suggestive of the introduction of Peters cartridges. Write for it to the company at Cincinnati, O., or the Eastern Agency, 80 Chambers street, New York, accompanying the application with ten cents for postage.

A Perfect Shoe for Hunting.

What a sea of trouble I have sailed across to find it. Handmade, machine-made, and some like Topsey, "just growed." One that is light and water-tight, not so it will stand water like a rubber boot, for that shoe will sweat your foot; but one you can cross a little water or mud dry shod. That will not slip; and above and beyond all that won't year you out by its weight. That will stand briers and—well, an all-round good shoe. Got it at Alfred J. Cammeyer's, Sixth avenue, New York city. Marked inside 6916—1069. PINK EDGE.

Spratts Patent (America), Limited, Newark, N. J., will be pleased to send their book of 96 pages to those who apply for it. It is entitled "Dog Culture," and is replete with information concerning canine diseases, and gives a full list of their products. To those who have friends whom they wish pleasingly to remember during the holiday season, their list of dog collars and furnishings and foods offers a large variety to select from.

The Marlin Fire Arms Co., of New Haven, Conn., have for 1903 prepared a desk calendar of special excellence. It is neat, artistic and useful. It is printed in twelve colors. It will be sent to applicants who will inclose two cents to the Marlin Fire Arms Co. for postage.

In our business columns this week Messrs. D. M. Lefever, Sons & Co., Syracuse, N. Y., advertise their new Lefever field, trap and pigeon guns, with their new single trigger specialty. All particulars are minutely set forth in their 1903 catalogue, which they will furnish to all who apply for it.

Colt's Patent Fire Arms Co., Hartford, Conn., have recently issued a catalogue, voluminous in text and artistically illustrated with half-tones of their products. The automatic Colt pistol, sporting and military models, are given special attention, both in the text and the illustrations.

WM. READ & SONS, 107 Washington St., **Boston, Mass.**

ESTABLISHED 1826. THE OLD GUN HOUSE.

Sportsmen's Gun Cabinets

The only hand-made and hand polished gun cabinets made in the United States. They are strictly fine goods and not cheap furniture factory trash.

Each year we have made them we have over-sold our output, particularly at the holiday season. A sportsmen's cabinet makes the most desirable gift that any lover of outdoor sports could wish for.

They are made in two sizes, a medium size 6ft. high, 31 in. wide and 12 in. deep, with spaces for five guns and rifles, and numerous drawers and compartments, and a larger size 46 in. wide and 19 in. deep, with much larger drawers and compartments, and spaces for twelve guns and rifles.

Each cabinet is fitted with a folding table, a very desirable feature, as it folds out of sight when not in use, but is raised and locked automatically when used as a loading table or writing desk.

Every part is hand-made and hand-finished and no expense has been spared to make them first-class in every respect. The woodwork is of the highest order and either the best quarter sawed dark Flemish oak or a specially rich mahogany finish can be furnished.

Prices $35.00 net for small size and $50.00 net for large size.

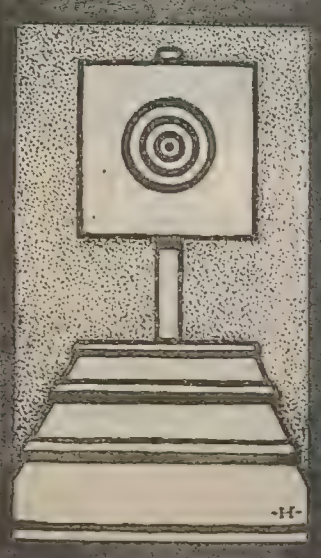
The UNION METALLIC CARTRIDGE CO.

313 Broadway, New York. BRIDGEPORT, CONN.

WINCHESTER CARTRIDGES SHOOT WHERE YOU HOLD



WINCHESTER

GREASELESS BULLET SMOKELESS POWDER CARTRIDGES.

THE severest kind of a test of the accuracy, cleanliness and general desirability of Winchester .22 Caliber Smokeless Powder cartridges loaded with Winchester Greaseless Bullets was made recently in San Antonio, Texas, by Adolph Toepperwein. Mr. Toepperwein, who held the World's Record for shooting flying targets with a rifle, having made a score of 979 hits out of 1,000 shots, undertook to better this record. He succeeded, making the remarkable score of 986 hits out of 1,000 shots, the targets being 2 1-2 inch clay discs thrown into the air by an assistant. Mr. Topperwein attributes his success in improving his previous record to the fact that the new Winchester Greaseless Bullet cartridges are so much cleaner than the lubricated bullet cartridges, which he used before. He says: "I am constantly using .22 caliber cartridges of Winchester make loaded with smokeless powder and the new Winchester Greaseless Bullet, and it is my belief that it is the best small caliber ammunition on the market. Its accuracy cannot be beat and I find the penetration equal to black powder loads and, if anything, greater, due probably to the hardness of the bullet. The ammunition works magnificently in any repeating rifle, and there is nothing to stick and gum [illegible] for the record last week, I shot in all 1,100 shots. During all this shooting, I did not clean the two rifles [illegible] necessary to cool them, although I shot quite rapidly. The barrels at the end of the 1,100 shots were as clean [illegible] only 10 or 15 times. I am glad that you are pleased with my shooting, but it was only the result of using [illegible] assure you."

FOREST AND STREAM PUBLISHING CO.

CANOE CRUISING AND CAMPING.

By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.

This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.

Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

ASHBEL'S GOAT. *Yo.*
DAWSON YESTERDAY AND TO-DAY. *J. B. Burnham.*

THE MOUNT VERNON DEER PARK.

WHEN by reason of the pressure of public and private business, Washington was in 1785 compelled to give up hunting, he broke up his kennel and gave away his hounds, including those which had been sent to him by Lafayette. But that he might not be without some reminder of the wild life of the forests, he established on the slope of the Mount Vernon estate, below the mansion-house, and extending along the river, a deer park of a hundred acres, which he stocked first with the native Virginia deer, afterward adding some English fallow deer from the park of Governor Ogle, of Maryland. In course of time, with the decay of the park palings, the deer escaped and had the run of the estate. George Washington Parke Custis, Washington's adopted son, tells us, in a chapter of his "Recollections," which is reprinted in one of the recent numbers of the *Woodcraft Magazine,* that Washington was extremely tenacious of his deer, and would permit none of them to be killed; but when it became evident that the hotel in a neighboring town was being supplied with haunches of venison taken by poachers on the Mount Vernon preserves, he consented to the killing of "an old buck." Custis was the master of the hunt, and chose for his weapon "an old British musket of the fashion and time of George II., a heavy, black, ill-favored looking piece, but capable of carrying two balls, each of an ounce weight, and famed for hitting hard behind as well as before." The buck having been wounded, and brought to bay in the Potomac, the carcass was carried in triumph to the mansion-house and there inspected with approval by Washington. The next day the venison was served at a banquet in the family dining-room of Mount Vernon.

This was in 1799, and it is the last record we have of the deer, but sixty years later, in 1859, Benson J. Lossing recorded that the antlers of "the Washington stag" were still preserved, and graced the great hall of Arlington House, the home of Custis, and of Robert E. Lee. Soon after this last date came the occupation of Arlington by the Federal troops, and the removal of the Custis and Washington relics. Perhaps some one at the National Capital, whose eye shall read this, may tell us what became of the historic antlers and whether they are still in existence.

When the Mount Vernon Ladies' Association of the Union assumed possession and control of the estate, the expressed purpose was to preserve the home of Washington as it had been in his day, and among other features of the grounds which it was thought desirable to restore was the long abandoned deer park. The funds for the purpose were provided in 1887 by the sons of the late Mrs. Robert Campbell, Vice-Regent for Missouri. The park is inclosed on the mansion side with a substantial iron fence; and contains at the present time eighteen deer. These constitute an animated feature of Mount Vernon, which is very pleasing; and sitting beneath the majestic trees of the lawn, one may see to-day just such happy groupings and graceful poses and pretty pictures of deer life as those which interested and delighted the proprietor of Mount Vernon more than a century ago.

BOB WHITE IN CHINA.

CERTAIN of the American residents of Shanghai are convinced that the American quail would prove an adaptable addition to the feathered game resources of China, provided a parent stock of birds could successfully be transported across the Pacific. One enterprise in this direction has already been undertaken, but has resulted in disaster, because of mismanagement at the American end of the line. Some 25,000 quail were shipped from San Francisco, consigned to residents of Shanghai, but because of improper and insufficient cooping all but a beggarly sixty-five birds perished on the voyage, and the survivors were so miserably weak and emaciated that they speedily fell victims to winged and ground vermin. The failure in this case was due entirely to causes which might easily have been avoided by the exercise of gumption on the part of the shippers; it argues nothing against the feasibility of the introduction of American quail into China; and as we have received in the pheasant so valuable a bird from the Orient, it is much to be desired, for sentimental reasons if for no others, that the United States might reciprocate and do its share in the world's game stocking by sending to China a consignment of vigorous birds which might be the first seed of a permanently established quail supply.

SHOOTING LICENSES.

THE shooting license has been so widely adopted in this country that the system may now reasonably be regarded as one which will be generally and permanently in operation throughout the United States. Among the several reasons for which the license system is advocated, one is that it provides a revenue which may be devoted to a fund for protection; another, that it may be so operated as to put a restraint upon lawless shooters and to bring them to account; and a third, that if the license fee be high enough it will reduce the number of shooters. Of these three reasons the first is the most cogent; but the last, if it be based on fact, is not a good reason; for any system intended to regulate shooting is meritorious only in so far as its makes shooting possible for a greater number, not for a less. It is true that with the passing of the years, shooting in the United States is growing to be more and more a luxury, that is to say, something which exacts more and more the expenditure of money for its gratification. But this very fact should demand from those who are concerned with the control of conditions governing the sport an earnest striving not to hasten the time when shooting can be only the luxury of the rich, but to defer the evil day as long as possible by discovering ways and means for assuring a continued game supply and a continued enjoyment of it by the shooter of moderate means. As we have said before, the man of wealth may be trusted to look out for himself; his are game preserves owned or leased, and stocked with home-bred game. Those who most require opportunities of hunting, those whose interests it is the duty of the State to conserve, are they who must in some degree at least count the cost. These constitute the largest class of shooters. That system of game protection, then, is most desirable which has for its object to promote the interests of this large class. The rule of the greatest good to the greatest number holds here. A license system which most closely respects this rule comes most closely to the accepted principle of good government. A moderate license fee, which applies equally to all and is a burden to none, is more equitable than one which puts all the burden on any one class, as non-residents.

A MARINE LABORATORY FOR FLORIDA.

THERE are before Congress two measures relating to the establishment of a marine biological station for the Gulf of Mexico. One is House Bill 11476, introduced by Mr. Sparkman, of Florida, and the other is House Bill 14353, introduced by Mr. Jones, of Washington. Mr. Sparkman's bill is printed in another column with the favorable report made upon it by the Committee on Marine and Fisheries. The Jones bill is an omnibus bill providing for the establishment of a number of fish hatcheries and for three biological stations. The proposed hatcheries are for South Carolina, Kansas, Florida (on the St. Johns River), Pennsylvania, Washington (in Yakima County), Michigan (on Lake Erie), Nebraska, Maryland, Utah, Wisconsin (Washington County), Arkansas (Fulton County), Minnesota (Goodhue County), Rhode Island, Kentucky, and Indiana. The projected marine biological stations are for the Florida Gulf Coast, for the investigation of problems connected with the marine fishery interests of that region; for Oregon or Washington, for the investigation of questions affecting the aquatic life and fishery interests of the Pacific; and the third, for the Great Lakes at a point in some one of the bordering States.

The location of each of the stations, and their establishment and equipment are left to the United States Commissioner of Fish and Fisheries. The provisions here outlined are those contained in the bill as it came from the Committee on Marine and Fisheries, with a recommendation that it be adopted. In advocacy of the biological stations, the committee says:

> The importance of biological stations on the Gulf Coast, in the Great Lakes region, and on the Pacific Coast cannot be overestimated. The marine life, its protection, and the climatic conditions are so varied and different in the different sections of our country that a thorough and complete knowledge thereof is of the utmost importance in the development of this industry. The problems needing investigation are the breeding times, places, conditions, habits, food, and feeding grounds of the most important food fishes in these different regions, together with their enemies during the earlier and later stages of their growth. The observations necessary in determining these matters cannot be carried on systematically by any one State, and should be conducted by the Government itself. This can be done only through the biological station, and its location should be determined only after careful investigation.

The Gulf of Mexico, with a coast line of 7,000 miles, contains fishery resources which are of immense importance, and are capable of being made of vastly greater value by successful development. Study of the marine life by specialists is a prerequisite to intelligent administration of the Gulf food fish supply; and to afford opportunity for such needed investigations the proposed marine laboratory is essential. It is of first importance to know the life histories of the marine species, and the conditions affecting their development. The work which the Woods Hole Station has done for the North Atlantic coast fisheries should be paralleled for the Gulf by such an institution as the enactment of either one of these bills would provide.

Massachusetts sentiment is all in support of the law which forbids the sale of woodcock and grouse, and is in favor of a renewal of the law for another term, or for making it permanent, as it should be. The trend of opinion is shown not only in the attitude of the protective associations, but in the notes of personal observation and experience. It is gratifying to be assured that the Boston game dealers are not averse to an extension of the law, and the outlook is for a favorable consideration of it by the coming legislature.

For Christmas Week.

Photographing the "Wild Turkey."

BY CHARLES L. JORDAN.

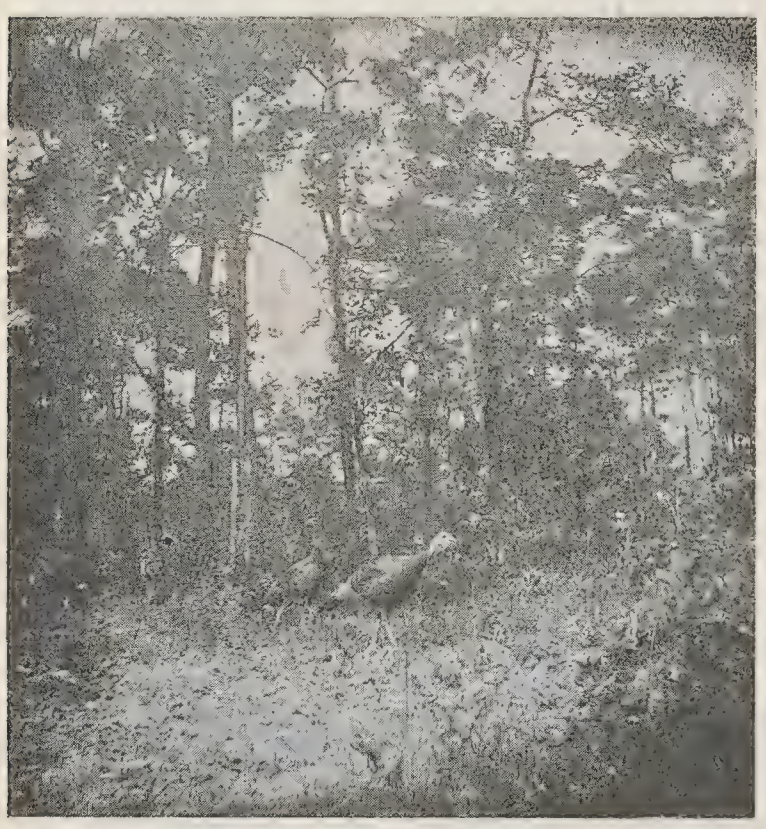
The average reader, contemplating illustrations in the magazine he is glancing over, little considers the cost to the author or producer in time, study, craft, discomfort and worry to obtain and produce; but let him try it!

When the naturalist-amateur photographer enters the wilderness, far from man's busy habitat, to secure, by aid of camera, that which under other conditions were impossible—faithful portraits of living wild fauna, of whatever name or character, be it mammal, fowl, reptile or fish—he undertakes one of the most arduous and often exasperating tasks.

Many of the half-tone photographic reproductions, purporting to be representations of sundry varieties of animal life, or death, and thus exploited, are snapshotted in parks, zoos, private preserves, or other prison affairs, and foisted upon the credulous reader as taken from the wild, free life in the native wood. Others from stuffed examples posing in museums—or possibly from live, tamed specimens tied in the brush or confined in cages, greatly to the detriment of the hard-worked naturalist who labors for facts, the honest way.

Such work as described involves about as much skill as exposing a plate on an unsuspecting calf in a barnyard, or a negro eating a watermelon, requiring no more thought or tact; but, is obtaining valuable and instructive portraits of wild animals in their unhampered freedom so easy? Try it!

Try wild turkeys in their native haunts; try whooping cranes, herons, bald eagles, goshawks, wild deer,



TWO HENS ON A HOT MAY DAY.

panther, wolf or the bay-lynx (wildcat) with his keen eyes and infallible nose, while marauding for hares. Try the razor-back wild hog of southern swamps and cane-brakes, whose keen scent will detect you a half mile; likewise try the dreamy alligator as he dozes on a slimy log or stalks a little nigger for his noonday meal. Try the fish fauna sporting in their native pickle, the water, with eyes and actions quick as the lightning's flash.

All these tax the genius of the most skilled and learned of men and methods. No bungler need attempt; but it's of turkeys, wild, untrammeled examples of that race I have now to speak. Three years since I was severely criticised on some free-hand illustrations in a certain magazine as to alleged defects, the subjects being wild turkeys, and the text raided with attempt to wreck.

Keeping temper, however, giving little attention to the unwarranted attack, I determined one day to even up with the self-posed cynic by producing something that should be above the pale of suspicion and beyond the reach of smart Alecs and meddling parasites, and what he could not accomplish in a thousand years.

I bought a camera.

Then my soliloquy ran—"I'll get in my graft by taking wild turkeys on glass plates, if it takes the rest of time; and, hence, ordered a plain box, universal focus—12-to-the-minute cyclone affair—with the solace of being equipped to tackle all kinds of photographic matter; but, ere long, discovered I knew more of other things than cameras; as a consequence, the usual trouble and blunders of the novice—I know better, now.

It was in 1878 when my first attempt was made, being permitted to enter the Homochitto Hills, in the State of Missouri, one of the grandest wild turkey regions in the South, in quest of the coveted portraits of that tribe, and to hunt and fish on the noble and bounding Homochitto River.

It was at the home of an elderly Swedish gentleman and planter that I had been advised to stop and linger, nor have I since regretted it. His name is Jensen, than whom a nobler spirit does not exist—one of God's best efforts. He greeted me a cordial welcome, and carte-blanc to all in sight. One of the best appointed and most comfortable rooms in the old mansion was pointed out to me as my den. It was one of the old Jefferson Davis plantations, an ideal, antebellum, Southern home, with its peculiar and quaint surroundings so vividly characteristic of the familiar erstwhile. Great oaks, hickory, pecan, beech, holly, magnolia, breathing and palpitating with swarms of bird life.

The Baltimore oriole with their hanging nest and the bluejay that pillaged them of their young—then the brown thrush, mocking-bird, jack-daw, shrike and the rest, doing nothing but making nests and promoting din; while the flowering-mimasa, sweet olive, crab-apple and cape-jasmine filled the air for miles around with delicious, intoxicating odors. All this supple-

OLD GOBBLERS AND ONE-YEAR-OLD.

mented by droves of ubiquitous little "niggers," who lead up slowly to strangers in stupid wonder and naïve curiosity; likewise doing nothing, by the aid of each other, but laugh, grin, yell corn songs, suck their fingers, roll in the dust or swing on the gates.

Here was Audubon's favorite haunt to study ornithology and hunt game, of which the country abounded. Here he obtained the live gobbler he reared and petted and loved so well and mentions so pathetically in his great work on American birds; and wept when the hunter (on the Ohio River), through mistake, killed the great bird and brought to Audubon the dead body.

Here, amid these wonderful hills and narrow valleys, I spent months stalking, crawling, calling—endeavoring to induce the festive, timid, tricky lynx-eyed gobbler to approach and pose. Did I succeed? Take a view of "Cripple Dick," the "Evening Meal," etc., and there's your answer.

The sobriquet of Cripple Dick was furnished me by the negroes on the place, due to a limp in his walk, as I had several times noticed while calling him, as he strutted, gobbled and coquetted with me beyond the reach of the camera, for a satisfactory exposure.

See that left leg? Seems shorter than its mate? So it is—an inch, and that's why he was so infernally wild. Let a stick crack, a bird flit across his vision, a squirrel drop a nut, he's gone! And why fate so decreed that I must cross lances with this crippled-up, oft-shotted, nervous, wary old reprobate in place of an easier and more plastic subject was a mystery to me. Of all the unreasonably, uncompromisingly wild things this individual excelled. He was wary and cautious

ONE OF THE WILDEST OF THEM ALL.

beyond measure, but he had a right(?) Once I had him baited with grain, to tempt him to appear near and pose, and was almost successful when some negroes passed in sight on their way to work, frightening him away. Then it was two weeks, I had him coming to call, gobbling and strutting, the camera resting on a fallen log, masked with bush and green leaves, and I was doubly sure, but fate steps in again just as he was turning a corner of timber in the open field—in full strut—when, bang! came the report of a big shotgun or a nigger's zulu—and that settled it forever with him, as I thought—and I am balked again; but in two weeks more I discovered him once more; this time on a range of hills of birch, magnolia and pin-oak timber and switch-cane, gobbling as vigorously as ever, and there hunted him still, two weeks more, daily, from day break until 10 A. M. Surely his was a charmed life.

Sometimes I had him within thirty paces strutting and gobbling, when he would suddenly, without provocation, drop his dress and nonchalantly and serenely walk away; then, with grim disgust and abiding fortitude, I did the same—homeward.

But my time came one Friday morning when there was nothing to molest, and the photo of Cripple Dick was the result. Wait a moment and get the story!

Ere it was daylight I got in an old hollow stump but an antique shell, with low switch-cane around it. He began to gobble at the first rosy tint of day, and when he had flown down from roost, I proceeded to invite his presence by appropriate calls to my impromptu studio, receiving in turn vigorous and favorable response, but putting in no appearance as yet. Now a long and provoking silence ensued. Hearing nothing of him in two hours, I apprehended a fright, but being in the turkey business and studying all of life, was no novice to their tricks, hence waited his pleasure.

Should I cough or sneeze, the opera would be over and the music done. Patience. He has had a leg broken by shot; his beard clipped by a rifle ball; hence not eligible as yet. I waited until the sun had crept in on me and was baking me to a crust. The birds had quit their din of song, the cow-bells had ceased to jingle, and all nature seemed in silent repose. I had taken my hands from the camera, while it rested in a niche in the old stump, entirely masked, save the lens, with moss and leaves, except a small opening on one side, to peer through. My position there was taken at half-past 4 A. M. It was now 10, and I wore

UNSUSPICIOUS.

out and hungry. When at the very acme of despair as the novelist would say, gil-oggle! obble! obble! rang out within twenty feet of me. Gee! It took my breath, so sudden and unexpected, nor had I the least idea the direction he was, but slowly and noiselessly slipped my hands to the camera—one to hold it firmly, the other to engage the button.

Peering with extreme caution through the little opening at the left side of the box, I could see nothing of him, but could hear the soft rustle of the cane leaves on his feathers as he moved stealthily by. Then I knew he was within 4 or 5 feet of me. Now I saw the end of his beak and the tip of his long beard, as it vibrated nervously from his breathing. That was all I ever saw of him, but knowing he was in range or scope of the lens, pressed the button.

That was all he saw or heard, but in the half second was passing over the tops of the pine trees 100 yards away, in glorious flight, yet, surely his memory and image were left indelibly on the plate. Being satisfied the impression was all right, as he was in the bright sun at the time, and believing the negative a good one, I gave up the hunt for him altogether.

From his position in the picture he must have been very near me while passing, as he was not beyond 8 feet when the exposure was made. He was a grand old bird with a gorgeous plumage and long, fine beard. Three days afterward Dr. Casey killed him, and I saw him dead—with regret—and photographed him prone. This was, briefly, the history, posing, taking and death of "Cripple Dick," and, although spending all that season on the Homochitto trying to photograph these wary fowl, that was the only male I secured; however, several females (hens) were taken, but at too great range to get sufficient detail of plumage.

Not satisfied as yet, I determined to go elsewhere, spending the next season in like quest, in the State of Alabama in vicinity of the swamps and pine hills contiguous to the Tom Bigbee River, in the effort to succeed. There my hopes were fully realized; the result of which placed me in possession of a liberal collection of the finest in the world, which are now in enlarged bromides 14x17 inches.

A few of these, as examples, I am allowing to be published for illustrating this text.

That the reader might know how faithfully I worked and what I endured to get these photographs, will say: I began in November, 1899, as soon as the young broods were nearly grown, and quit in May. Not a day, save one, when a thunder and rain storm

kept me in doors, that I was not in the woods walking 5 to 15 miles every day in dogged search, worrying with these indescribably wild and sensitive creatures.

Nothing save that innate love in the born naturalist and sportsman prompted and held up my arms to stand the test.

Near one hundred plates spoiled, snapping under all conditions of light or position—for the least shade or a haze over the sun—you get no picture. You hope, trust to luck. You develop and get—disappointment. That's what you get endeavoring to get a wild turkey to stand up and look pleasant. After all, my success

WHEN THE SHUTTER SNAPPED.

COME TO ATTENTION.

is quite satisfactory. I have examples of the grandest old gobblers on this continent, varying in number from a single individual to bands of three to ten—all that could be crowded on to a 4x5 plate.

How I did this is almost a marvel, even to myself; having nothing to level, range or sight by except the eye, and corners of the camera as guides, as finders are out of the question, yet surely they are secured on the plates in every instance as faithfully as if operating in a studio, as evidenced by the accompanying illustrations; but you will bear in mind, brother, it took me three months the first season and six months each of the next two seasons to accomplish it, and that, too, in unremitted daily work, in rain, storm, sleet, snow or hot, baking sun.

My second year's efforts lay in the hammocks adjacent to the swamps of the Bigbee River mentioned, once historic hunting and battle grounds of the Creek, Seminole and Choctaw Indians; the finest and richest

THE EVENING MEAL.

hunting lands the sun shines upon. Even now many a noble *gallipavo* forages in freedom amid its primeval luxuriance and splendid woodlands, fattening upon its plethora of beech nuts, acorns, gum seed and other food.

In those, my own native haunts, I felt assured, the best specimens of the turkey tribe would be found, being familiar with every habitat, hence the quest, which began in November, lasting into the following May.

After much research a band of magnificent old males was located, their daily trend and haunts figured out, the work of getting near enough to secure good plumage detail contemplated a place that appeared one of frequent resort was discovered, when they assembled to scratch up the dry leaves in search of food. Here I resolved to watch, stalk and call, but as yet had seen none of them, but their number and age was clearly indicated by tracks crossing old forest roads, in which manner a half dozen or more were estimated. One day, while lying in wait, I saw them approaching, feeding slowly along as if time was of no consequence to them.

Now, they must come very near, lest the images be too small to obtain the sufficient definition—say 10 to 15 feet. Meantime, the camera rested upon an old log masked with leaves and débris. At length, however, they came right along unsuspecting the fiend lurking behind that charred and blackened log, or the mask of brush heaped upon it, so intent were they gathering their evening repast. Such a sight would thrill the most callous.

The mob consisted of nine old bearded and spurred patriarchs, with wrinkled necks, black satin breasts and gorgeous, bronze plumage, reflecting an hundred evanescent colors in the bright sunlight. It was worth a thousand miles of carfare to have seen the sublime spectacle, and what a pity that only the black and white half-tones can be reproduced, leaving those matchless metallic reflections to waste in the desert air! When in twenty paces of my hiding they began to veer to one side, but a low note from my caller caused them to turn and drift within 19 or 20 feet, when the exposure was made. On the photo, "Evening Meal," only four of the old birds are secured on the 4x5 plate—and snapshot work at that, for the least attempt at time, being unavailable on these sensitive and nervous creatures. The first click of the shutter all are gone.

The metallic click of the camera or cocking of a gun has a significance alarming to all wild animals, but with the turkey, unless the cause is seen, fear is soon over and they will return and renew the feast as if nothing happened, sound alone seldom disturbing them, but a sight of the human enemy is all sufficient to clear the premises of their company for that day at least—no argument will stop them.

In "At Sunrise" we have a splendid portrait, not only of the picturesque attitude of the subjects, but also of the yellow pine forest landscape as well. This was snapped as the sun had lifted above a nearby hill and shone in splendor over the surrounding woodlands and the feeding birds, consisting of one old gobbler and two yearlings that sport no beards as yet.

The shade being on the wrong side of the latter to get plumage definitions, the button was pressed just as the old bird raised his fine head to scan for danger, and when the shutter clicked a loud put! put!! put!!! brought the others to attention—when all three—"caput et auribus erectus in swampo," made a sublime spectacle, and had another plate been available what a grand picture could have been secured, but their suspicions aroused, there was no time for speculation, and "exeunt omnes" was the finale.

[The photograph of the crippled gobbler unfortunately proved to be unadapted to reproduction.]

AT SUNRISE.

Maine Guides.

While somewhat slow in the matter, yet "better late than never." Allow me to congratulate you on your editorial entitled, "Maine Guides," in Forest and Stream, issue of Dec. 6. It describes present existing conditions among the Maine guides (as I found them) to a dot. There is a growing tendency among guides to strictly observe the law, and to encourage sportsmen to do so.

On no one point does your argument state facts more truly than in respect to crowds of Western visitors flocking to the woods of Maine, who deplete the "game and fish resources" without giving in exchange an "equivalent" other than the wages of a single guide to a crowd, which, of course, is not an "equivalent." I heard, the past fall, a great deal of complaint on this score. And the guides claim that these Western crowds kill more game than other sportsmen, for they are expert hunters.

There was considerable discussion among the guides whom I happened to meet, in favor of increasing their charge for hire from $3 to $5 per day; and of requiring not less than one guide to three sportsmen—in fact, of forming a guides' union. Good wages should be paid to guides the same as to other people, but only in proportion to the value of services rendered. Should their union materialize it would far better stand on the rock of game protection, than on the flimsy foundation of a minimum or maximum wage scale. Guides are very much the same as other people, some are worth in hire $5 per day, some $3 per day, and others come high at 30 cents. No, guides, leave out a fixed rate for your hire and stand on your own individuality! Do not allow the unworthy to "hold up the worthy!" A rule of not less than one guide to three sportsmen, however, should receive support and encouragement from all sportsmen worthy of the name.

A minimum wage of $5 per day for Maine guide hire, would drive thousands of annual visitors out of the Maine woods into the woods of New Brunswick. The difference between the Maine and New Brunswick price for guide hire, would more than pay the shooting license of New Brunswick, and take one to fields which he skips now as a matter of economy.

Skipping from one subject to another, I wish to indorse Mr. Jos. Shurter's argument when he says that "bullets fired from high-power rifles are sure to be stopped by natural obstructions before they have exceeded the range of black powder rifles." This, of course, applies to shooting deer in thick woods. To the doubting ones I would say, just try it and be converted. I have experimented, out of curiosity, where I knew it was perfectly safe to do so, and am surprised to find how quickly a bullet will "fetch up" against some "natural obstruction," when fired in thick woods.

William H. Avis.

"When the Long Shadows Fall."

At dusky eve, when the long shadows fall,
And the last sunlight lingers on the wall,
My book laid down, I light my pipe, and dream
Of long past hours in forest and by stream.

Once more I saunter up the woodland way,
To seek the sweetest, brightest flowers of May,
And gather clusters of its fragrant sheaves,
Hiding their buds beneath the withered leaves.

Again I loiter by the mountain brook,
Tempting the wary trout from shady nook,
Or cast the fly on lake or river fair,
To rouse some giant from his stony lair.

In summer's heat I seek the forest's shade,
And on some mossy stone supinely laid,
With limbs at rest, and mind at perfect ease,
Watch the stray sunbeams flickering through the trees.

I see the grouse burst forth with thundering wings,
I hear the woodcock's whistle as he springs
From alder covert near some marshy rill,
Or scattered birches on the sunny hill.

I hear the nutshells pattering as they fall—
Some squirrel feeding in his leafy hall—
And joining in his feast with right good will,
The beech and chestnuts soon my pockets fill.

From dewy spring to autumn's golden haze,
Float back the visions of departed days,
Forming bright pictures to the mental eye,
Of stream and forest in the hours gone by.

So may it be, when life's last shadows fall,
And quietly I wait the final call,
May pleasant memories cheer the parting day,
And light the path along the untrodden way.

Von W.

Dec. 12.

The Wolf at the Door.

BY FRANCIS MOONAN.

The three friends had eaten their Christmas dinner after the time-honored custom and returned to the bar-room.

Jake Kümmelwasser, the inn-keeper, looked decidedly more pursy than he had a year ago, but evidently was still well content with himself and the world.

Wirt Zaender, the silent philosopher and hugger of hot stoves, had more the appearance of a clothes peg, or lay figure, whilst his complexion had deepened its resemblance to a dried tobocca leaf.

Only Tim Mulcahy, the sportsman—the braver of wind and rain and frost and snow—appeared wholly unchanged. Like a well set frame was his square muscular body, and his cheek had the tone of a rosy russet apple Despite his fifty years he might easily have passed for forty.

Everything about the bar-room wore its accustomed air of order and neatness and homely comfort. The canary had ceased to sing, but the kettle on the stove had taken up his lay after its own soothing fashion. Outside the winter wind blew searchingly about the eaves, or occasionally indulged in a fit of bluster which caused the windows to rattle.

"Vell, gentlemens," said Jake, "vat you tink?"

This remark was intended less as a question than as a comment on the situation of things in general.

"I think," said Tim, "that we're three lucky min. How many poor craytures has to dine on sinkers and coffee, or maybe go hungry this blessed evenin'."

"Ya, ya," sighed Jake, "der volf at many a door alretty is!"

"The wolf at the dure—the wolf at the dure!" took up Tim. "Ay, ay, I remimber—I remimber."

For a while he leaned against the bar reflectively and then rousing himself, exclaimed:

"Come, boys, sit down and I'll tell yez a story."

When the three friends had taken their seats around the stove Tim spoke as follows:

"There isn't many things I haven't turned me hand to since I came to this counthry. I've carried the hod, I've driven a hearse, I've struck for a blacksmith, I've held a candle for a plumber, I've laid ties on a railroad, I've cooked on a canal boat, I've hoed corn, I've washed dishes in a restaurant, I've blasted rocks in a quarry, I've cut ice, I've shoveled coal, I've run a razzle dazzle and I've bossed wild bastes in a menagerie.

"There's one other thing I did that ought to have made me a millionaire, but it didn't, and that is I dug for goold. Yez mind Casey—him that caught the wild cat. Well, years ago Casey and me was out in Colorado workin' in the mines. Afther me experiences there if I iver find meself in Roosia I'll keep out of Sibayria—that's all.

"Well, one evenin' Casey and me was down at the 'Rattlers' Din,' which was the name of a saloon run by a man by the name of Brimstone, or Ould Bill Blazes, as we called him. He had the place all fixed up with rattlesnakes that he claimed to have killed. We used to say he kept thim on tap for his impty bottles. Well, sir, on the evenin' I spake of everything was unus'ally quiet. Instead of a rattlin' of dice and a cussin' and a-swearin' there was Ould Bill Blazes dozin' in an arum chair and me sittin' at a table readin' a paper and Casey amusin' himself with the dice at the bar. I don't know why it was, or at laste forget. At all ivints it was only the calm before the storm.

"I was beginnin' to get a little drowsy meself listenin' to the snorin' of Ould Bill whin the dure opened and in walks a man by the name of Sour Mash Sam—a big, raw-boned man, with long hair and a skin on him like an alligator. He was supposed to have been a horse thief or something of that kind and was gin'rally looked on as a dangerous man. I bid him the time of the evenin' and he just nodded and walks up to Casey.

"'Good evenin', stranger,' says he, 'have a throw for drinks.'

"Casey hesitated a minute and then said, 'I don't mind.'

"'You throw first,' says Sour Mash Sam.

"So Casey began to throw and threw 37.

"'Reckon I'll bate that,' says Sour Mash, takin' the dice.

"'Ha!' he cried afther makin' the first throw, 'four and five is eleven and three is seventeen.'

"'Hould on!' cried Casey, 'that's not the way to count.'

"Whin I heard Casey say this I cocked me ears, for I smelt trouble at once. Now Casey in thim days was a quiet unasshumin' young man—just the sort of one you'd think you'd be safe in bluffin', but there's where you'd make the mistake.

"'That's not the way to count—eh?' says Sour Mash, glarin' at Casey. 'Wal, that's the way *I* count.'

"'Well, thin, me man,' says Casey, 'you'd betther go back to school.'

"At this Sour Mash let fly a volley of oaths and wanted to know if 'a green galoot' like Casey preshumed to tell *him* to go back to school.

"'You're a green galoot, ain't you?' says he.

"'Well,' says Casey, 'I may be green but I ain't *black.*'

"There was a silence of a minute or two, while you could see Sour Mash's mouth workin'. Thin with a roar like a bull he made a dive for his gun, but Casey was too quick for him and had him round the body, pinnin' his arums to his sides. I seen it was me turn to lind a hand now, so I got up and wrinched the weapon away from Sour Mash. Casey thin squared off and let fly with his right and sint the bully sprawlin' on the flure.

"'If you won't go back to school I'll tache you a lesson anyway,' says he.

"'That'll do, Casey,' says I, 'and now come home.'

"At the dure I turned about and says to Sour Mash, who was gettin' up from the flure rubbin' the back of his head and lookin' cowed as a sick calf: 'You can have your gun back, me man, whin you learn to be good!'

"Casey and me trudged home to our shanty in silence. Once there, howiver, I took Casey by the hand and shook it.

"'Casey,' says I, 'you're a man. But you've upset our hopes of becomin' millionaires. We've got to clear away from this at once. I hate turnin' me back on an inimy,' says I, 'but whin an inimy is a common murderer there's no help for it. If we stay here our lives isn't worth twinty-four hours' purchase.'

"Casey agreed with me sadly, so we set about gettin' ready to start. We got our few spare duds and a couple of blankets together and tied thim up in bundles; thin stuffed some bacon and hard tack, with a few cookin' utinsils, into the bundles and flung thim over our shoulders. We took a last look around the shanty, wished it ajew and thin struck for the thrail.

"It was late in the fall and the moon was shinin' like an electhric lamp. So along we pegged at a good rate, not sorry to be cuttin' loose from our way of life, though wishin' we were loaded with goold instead of ould duds. Afther we'd covered five or six miles, we began to feel a bit tired, for the thrail was rough, and we decided to go into camp for the night. There was a belt of pines to our right, and we inthered this and selected a spot. In a little while we had a fire lit, cooked some bacon and made our supper; thin wrappin' ourselves in our blankets were soon fast asleep.

"I awoke towards mornin' with the soughin' of the pines. The moon was gone down and it was dark as pitch and much coulder. A change in the weather, thinks I; the Lord grant it don't come on to snow!

"I roused Casey and we had a bite of breakfast and as soon as it was light enough to see we shouldered our packs and started on our way once more.

"Now the station, as I'd often heard, was about thirty miles distant from the mines, so with fair weather and no mishaps we didn't doubt that we'd be able to make it before nightfall. But the looks of the weather filled me with unaisiness. It was leaden and glowerin' with a low wind moanin' across the mountains. I said nothing, howiver, only kept urgin' Casey to quicken his pace. Along towards noon I could hould me thoughts no longer, so I says:

"'Casey, I'd give the biggest nugget I iver seen mined to feel just one drop of rain.'

"'How much would you give,' says the poor innocent, 'to see a flake of snow, for there's one?'

"I started like a man at the sight of a ghost.

"'Casey,' says I, 'God help us if the thrail should get covered up!'

"With that, in a sort of panic, I started on a run and called on Casey to follow me. But runnin' over a rough thrail is no aisy matther and we were soon winded. But the minute we got our breath off we started again and kept this up for a couple of hours. Manewhile the snow was fallin' fast, coverin' up the thrail, so that we could hardly see it. I prayed to God that we might fall in with some one who knew the counthry, but niver a soul did we lay eyes on. Pantin' and perspirin' we struggled along, keepin' the thrail to the best of our judgment, whin suddenly we had to pull up for fear of fallin' into a chasm.

"'Casey,' says I, 'we're off the thrail. Back on your thracks for your life, man!'

"For a while we were able to see our thracks, but the snow continuin' to come down like a blanket they grew fainter and fainter and fin'lly disappeared altogether. Me heart sank within me like lead and I felt like throwin' meself down on me face in the snow. Oh, but it's a terrible feelin' to be lost in the wilderness. Whin I was a boy at school I remimber readin' a poem about a sailor that was cast away all by himself.

> "'Alone, alone, all, all alone—
> Alone on a wide, wide say!'

"That's how you feel, and for the moment I forgot I had Casey with me.

"'What's the matther, Tim?' says he, seein' me standin' there as if I'd been turned into a stone.

"'Casey,' says I, thryin' to conthrol meself, 'we're lost—that's what's the matther, me poor frind!'

"'We're lost!' he cried in a wild, frightened voice; 'oh, my God, Tim! and I'm the cause of it. Forgive me, won't you?' And he grabbed hould of me hand.

"'Casey,' says I, 'I have nothing to forgive and you don't act like the conqueror of Sour Mash Sam. We're lost, 'tis thrue, but we may find ourselves again. Sthranger things have happened. Now, the first thing to be done is to get our bearin's, if we can, so if you plaze I'll make a few observations.'

"I knew something of woodcraft and began to examine the thrunks of the trees and the growth about thim, but couldn't make much of it. Thin I climbed to the top of a tall pine and viewed the counthry all 'round, but couldn't see the laste sign of a habitation, or anything to guide me. So I climbed down and tould Casey that so far luck seemed against us, but it might turn.

"On a bould vinture, thin, we struck out a line through the openest part of the mountains. We kept on this till it was near nightfall, whin once more we had our path cut off by a chasm.

"It was still snowin', but lighter. We got into the woods and prepared to spind the night with heavy hearts. We lit a fire in the lea of a big rock and cooked our bacon, but though we hadn't ate anything since mornin', nayther of us was hungry, bein' too anxious, faith. But we were like to be hungry enough before long, with nothing but wind, maybe, to fill up on.

"Whin we'd done atin', we cut some spruce boughs, shook the snow off thim and spread thim about the fire to sleep on. Thin we sat down and lit our pipes.

"By this time the snow had stopped fallin' but it blew up piercin' could, so that we had to wrap our blankets about us. There we sat like a pair of red min by the flickerin' camp fire, and just about as churful and talkative. The dead laves rustled around us in the chilly blasts and the pines whispered and sighed like so many sperrits above our heads.

"'I'm thinkin', Casey,' says I, 'that this sort of a life would make an Injun of me before long.'

"Casey didn't answer, but heaved a sigh, poor man. By and bye, seein' that it was no use attimptin' conversation, I says:

"'I guess I'll go to bed and lave you to look afther the fire till midnight; thin I'll keep the second watch till mornin'.'

"I was afraid if I let Casey go to sleep first that I couldn't trust him to stay awake in the early hours, which was the time the fire would be most needed.

"'Where's that chambermaid with the warmin' pan?' says I. 'Well, here goes. Good night, Casey—and mind you don't nod and let the fire go out.'

"'No fear,' says Casey, as he put on more wood.

"With a log under me head and me feet to the blaze I wrapped me blanket close about me and closed me eyes. But though I was tired I was so anxious I couldn't sleep. What was to become of us with only another day's rations—half rations at that—and no firearms, or lastewise only a little six-shooter? I lay ponderin' this question with eyes half closed till long into the night. I could see Casey sittin' by the fire a picture of melancholy, with head thrun' forrard on his breast and hands hangin' by his sides, but rousin' himself now and thin to keep the fire alive. The wind wint down and everything became still as death. All of a sudden out of the blackness of the forest there rose a horrid panjemonium as if all the divils had been let loose and thin something flopped down near the fire and was away in a minute, silent as a spook.

"Casey jumped up with a shout and thin fell a thrimblin' like a lafe. I tell yez I was scared meself, but only for the minute or till I opened me eyes; then I knew it was only a big horned owl objectin' to our fire.

"I began laughin' at Casey, and hearin' me he took courage and cries:

"'My God, Tim, what was that?'

"I explained the situation to him and thin lay down again, and do yez know that afther this my thoughts bein' disthracted I fell sound asleep.

"I woke with the could and seen the fire gone out and Casey doubled up, snorin' like a bagpipes. I was goin' to rouse him up and coort-martial him, but no, says I, the poor crayture needs all the sleep he can get; I'll take him to task in the mornin'.

"I built up the fire again and set it agoin', and thin as I sat ponderin' an idea came to me. Now in me young days I sarved a year before the mast and knew something of the stars, and my idea was that if I could locate the north star I'd be able to lay a coorse for the mornin'. I looked up at the sky and seen that the clouds were all cleared away and the stars shinin' bright. So I crept out of the forest and made me observations and found that we'd been thravelin' due north instead of south, which shows how one gets twisted up in the wilderness. Well, I laid out our coorse for the mornin,' feelin' that it was God directed me and returned to camp. I found Casey still snorin' away and I let him snore till it was just daylight; thin I shook him and he woke with a start.

"'Casey,' says I, 'I must complimint you on bein' such a wide-awake watch.'

"'Sure, Tim,' says he, 'I didn't intind it, but the sleep stole on me.'

"I believed him and forgave him. 'But,' says I, 'we're on a perilous voyage, me man, and we've got to steady our helm and keep a sharp look out.'

"We ate a little hard-tack, savin' the bacon for dinner, weighed anchor and lay to our coorse. We met with nothing but head winds and cross says and had to tack twinty times before noon and thin we didn't seem much advanced. In the afthernoon we made a little betther way and thought that maybe we might fetch up in some port, but the night found us still tossin' on the high says.

"Well, to drop me nautical lingo we wint into camp in the head of a rocky defile. The weather continued clear but could as death. We made a fire, fixed things as comfortable as we could and thin the question was whether we should fry all our bacon.

"'Fry it all!" says I; 'no use makin' two bites of a cherry.'

"That night I kept the first watch. All was quiet till about midnight, whin what should I hear but the barkin' of wolves in the distance! It made me blood run could. I didn't wake Casey till on towards mornin' and I said nothing about the wolves.

"'Ain't you goin' to lie down?' says he.

"'No,' says I, 'I'm not sleepy.'

"'Nor hungry, maybe,' says he, by way of a joke.

"'Nor hungry,' says I.

"'Thin,' says he, 'there's something wrong. Tim, you ain't goin' to give up?'

"The words stung me and I jumped to me feet.

"'Whin Tim Mulcahy gives up,' says I, shakin' me first, 'St. Pether or the divil will have him by the hand!'

"'That's good,' says Casey. 'Faith, you rouse me courage, Tim. But see, there's the dawn.'

"'Sure enough,' says I. 'Lord! how strange it looks!'

"Whin we haven't slept we look at the world with different eyes. Ay, ay, so we do.

"I will pass over two days that followed this, whin we wandered about God knows where, starvin' and miserable. How we survived I don't know, but I suppose the youth that was in us kept us alive. I don't want to dwell on thim days and nights, so I will pass thim over and come to the third day.

"It was evenin' and we were thryin' as a last chance to make our way to a spur of the mountains that commanded an extinsive view. I'd often heard that there were hunters' camps scatthered about and I knew that our only hope now was to discover one of thim. But I feared we'd niver get there in time to see smoke, if by chance there was any to be seen. It was beginnin' to grow dusk, and we were crossin' a sort of clearin' more like two specthres than live min. Casey was ahead of me, for he was the waker of the two, and I wanted to encourage him by makin' him think he was walkin' me down. For a minute I stopped to take breath and look back. Something caught me eye that sint a could shiver down me spine. It was a mere shadow as I may say flittin' across the clearin' into the black belt of the pines. A'most before I could realize it, it was gone. I hoped it was nothing but the vapors in me head risin' from me impty stomach, and yet I feared—oh, how I feared! But, however, I said nothing and wint on afther Casey. I didn't want to look back again, but prisently something seemed to magnetize me from behind and I turned round. As I looked me heart gave a bound and thin seemed to stop. A hundred feet away right on our thracks was a big gray wolf! Seein' me stop he stopped too and cocked his ears, thin disappeared like a shadow as before.

"The perspiration broke out all over me and I had a feelin' of sickness as if I was goin' to vomit, savin' your prisence.

"'What's the matther, Tim?' says Casey, turnin' round, for he missed me footsteps behind him. 'Ain't you feelin' well?'

"'Oh, a little passin' wakeness,' says I. 'I'll be all right in a minute.'

"Casey limped back to me.

"'Come lane on me,' says the poor soul. 'I'll help you along.'

"By the powers, gintlemin, if this speech of Casey's didn't make me as brave as a lion and I felt as if I'd encounther a whole pack of wolves to save that poor unselfish frind.

"'On Casey!' says I. 'If there's any lanin' to be done it won't be done by Timothy Mulcahy! All the same,' says I, takin' his hand, 'thank you kindly, Dan, for your offer.'

"We hadn't gone more than a hundred yards whin we got to the ind of the clearin' and thin what should we spy but a little log cabin. It was like the sight of a plank to a drownin' man.

"'Casey,' says I, 'the luck begins to turn.'

"We inthered the cabin and found it spread with pine needles and mountain grass, comfortable as a parlor. In one corner was a place for a fire. The dure was sthrong and swung on two hinges. I looked about to see if by chance there was any remains of ould hide or ould bones or anything to make a supper on, but nary a thing could I see. Well, says I to meself, if we've got to give out to night at laste the wolves won't ate us.

"No sooner had I said this than I started with an idea that flashed through me mind. I was going to tell it to Casey, but the poor man was so done up that he'd gone right to sleep standin' as he was, with his head up against the side of the cabin. I took him in me arums and laid him on the flure, thin wrapped his blanket about him and covered up his feet with the withered grass and left him to sleep—maybe for the last time.

"As I said the dure was sthrong with an iron bolt and a wooden bar and if once closed a dozen wolves couldn't break it down. But I didn't close it, but left it ajar, or about a foot open and thin took a sate behind it with me eyes to a chink.

"Night was fallin' fast, but there was a full moon, and afther it was dark it was brighter than it was before.* The hours slipped by and there I sat with me eyes to the chink in a state of horrible suspinse. For the time bein', howiver, the hunger had stopped gnawin' me vitals. Casey slept without a move or a sound, so that you'd think he was dead. Once I took alarum at his bein' so quiet and crept over and put me hand on his chest. It was heavin', though with me ear a'most down to his mouth I could scarcely hear him brathe. But he was alive and that satisfied me, so I crept back to me place by the dure.

"Everything remained quiet till about the middle of the night, as I judge—the moonlight stramin' down on the white snow and the pines all standin' up black against the sky. Once or twice I heard an owl whinnyin' like a horse (Ugh! 'tis the sthrange church-yard birrd!) but that was all. But about the hour mintioned I gave a sudden start and me flesh all crept on me bones, for there was that shadow on the snow again! I grabbed me jackknife that I had open by my side and waited, with me eyes glued to the chink.

"For a whole hour the shadow—for it scarce seemed more—came and wint, but always nearer and nearer. At last it came within a few yards of the dure and sniffed, but on a suddin darted back and wint prowlin' round in the rear. I heard it sniffin' through the logs—oh! how me heart bate!—and thin retratin' once more. For half an hour maybe—sure it seemed half a cintury—I seen nor heard no more of it, whin without warnin' there was the shadow before the door again. This time it came right up under me nose and listened. I held me breath. The next minute the wolf had his head in through the openin' and sniffed. Quick as a flash I jammed the dure to and had him by the neck. He made a hijous outcry, but I quickly silenced him with me knife.

"I was thrimblin' like an aspen lafe whin I turned round to see if Casey was awake. But he was sleepin' as pacefully as if nothing had happened.

"'So much the betther,' says I; 'I'll give him a surprise.'

"I set to work at once and skinned the wolf. This done, I lit a fire and thin, gintlemin—well, yez may be squamish and I don't want to spoil your digestion on this evenin' above all, so I won't inther into details.

"The next day, afther a fine sleep, we made the spur of the mountains, and luck bein' on the turn, as yez know, we didn't cast our eyes about in vain. Less than a mile away we seen a thin column of smoke risin' through the trees in the mornin' air. We made for that and found a couple of hunters who took us in and thrated us like hunters—I need say no more. In twinty-four hours we were ourselves again and thin we were sint to our destination with a guide. And, in troth, whin it was all over I thought it was only a dhrame, but bad cess to me if it ain't the truth, the whole truth and nothing but the truth."

"Let us for the notary publics send!" said Jake, the scoffer.

Wirt Zaender was so much awed that he didn't even smile.

* It is to be feared that this exquisite Irish bull was lost on Tim's audience.

Rainy Chase of the Robber Crab.

Christmas only a week off, at the end of a wet fortnight still raining cats and dogs, and Talolo felt himself up against a proposition.

It wasn't so much the weather, though even Samoans do not find unalloyed enjoyment in their rainy season from November to March when it rains all the time, and frequently more so. The rain beats on their bare backs like so much small shot thrown in unremitting handfuls, and they say it stings. It messes up their hair as well and drapes their scanty garments about them as so much wet rag. The rainy season is the hot season as well, a combination of tropical misery to which no mere words can begin to do justice.

But it wasn't climate that was wearying Talolo's soul, or the nearest Samoan equivalent to, or substitute for, that organ. When one is born to a dispensation of Providence that supplies an annual rainfall of fifteen feet coming all in a bunch and runs the thermometer close to a hundred at the same time, there comes a certain sense of resignation which, after all, is the best any one can do about any weather. It was Christmas that was worrying the lad, Christmas and his "mea alofa," his loving things as the islanders say, the love proving uniformly a mercenary sort of emotion in which a little gift is to elicit a much larger one. Talolo was by no means fretting about what he was going to give me. That was easy in his simple savage state and I already knew what it was to be. He had taken the pains to tell Tonga so that the knowledge might come to me indirectly and govern me in settling upon my "mea alofa" to him. He had already ransacked the simple treasures of Salatemu, his mother at that particular time of the current series, had laid purloining hands on two baskets woven of gaudily dyed fibre, together with a large sleeping mat. He had asked Tonga if she did not think that in return for his doing so much for me I must make a really princely return, perhaps even the "shoot gun." Poor boy, he was always hoping against hope for that regular companion of our excursions into the deeper jungle. He knew that the Consulate was a place at which laws were made for Samoa and it was beyond his power to comprehend why that did not give the same right to break laws, in particular that which forbade the sale or gift of arms and ammunition to Samoans. So far as I was concerned Christmas involved for him neither cost nor worry.

But there were others. Those others were of his own race and quite up to all his little games and devious wiles. A small gift to me might win a rich return because I was a Papalangi, one of those innocent foreigners who were ever such easy marks for Samoan craft. But with his own he knew that the presents that should come to him would depend entirely on the scope and magnitude of his love to the giver as measured by the gifts he himself gave. The proposition that confronted him was money to enable him to go to the traders around the Matautu corner and down in Apia; and money was hard to get. Early in our acquaintance we had settled on the gift that I was unfailingly to render as the offering on the sacred altar of friendship, a tin of salmon or corned beef and four hardtack to be eaten on or off the premises. But money—well, when Talolo got money from me it was in return for real service rendered. A sixpence was not difficult to get, that meant only the fetching in of another bunch of bananas to hang mellowing on the veranda. But in the holiday emergency what was a sixpence? No less than a dollar would carry through his Christmas present making on the scale that befitted the son of the chief of Vaiala and particularly one so close to the administration as Talolo boasted himself to be. But the lad had early learned the lesson that it is not always so easy to get a dollar; so far as I was concerned he knew it was not to be had for the mere asking.

All these facts came out when Talolo paid me a call in a pouring rain when Christmas was right upon him and that dollar still far out of reach.

Now, in Samoa when it rains it rains. It surely was out there that they concocted the proverb about its never raining, but it pours. From so many directions did the rain come at once that there was not a dry spot on the veranda, and we were driven into the stuffy interior of the house with every door and window shut and caulked tight. The walls and windows were tearful with the drops of condensing humidity. One could actually see the blue mould grow on the leather of shoes and belts and the mildew spotting the linen of our duck garments.

Out of the storm into the merely soggy dampness of the interior enter Talolo, shining with the rain, clothed in clammy rags, bonneted with a close-fitting cap made of banana leaf twisted up to keep his hair dry, vainly struggling in the fierce blast of the hot north wind to make banana leaf serve the purpose of an umbrella. Over all was an air of the most ponderable gloom, a misery that oozed from every pore. He was quite too wet to be allowed to bring his melancholy inside the house and he was promptly sent down to the cook house to put on a dry lavalava belonging to Tanoa and to get his rations. These details satisfactorily settled, Talolo was admitted to the house, clothed and dry but still gloomy. That looked bad, for a melancholy that could last though a mere trifle of between two or three pounds of solid nourishment had been consumed, argued a serious state of affairs for Talolo. The reason soon came to light as above set forth, Talolo must have a dollar, he was so completely in need of it that he would actually work for it.

"Tama'ita'i e!" said the sorrowful Talolo when his tale of woe seemed to suggest to me no ray of hope gleaming with "le tala e tasi" or one dollar; "Tama'ita'i e! Ta te tutulimanu!"

"Tutulimanu!" ejaculated Tonga with fine scorn. "Pursue animals, indeed! I think so, you fool boy. What animals, think you, the Tama'ita'i will pursue in the Vaipalolo, the season of the rains on the coasts and the rains on the mountain backbone, the rains on Samoa 'uma all-over always? Come now you great pursuer of animals, where are the lupe pigeons in the Vaipalolo? Are they here along the coast feeding on the berries or are they on the Tuasivi lean and hungry in the rain? Or when the blows from the north until great ships go to smash at their anchors in Apia think you that the Tama'ita'i has the powerful arm to fish for great fish with the rod that is in three pieces and has bird feathers on the hook and the noisy spool for its line?"

This burst of eloquence checked Tanoa, who, at the first mention of hunting had started to get out the shot gun even though it had been carefully swathed in greasy rags to protect it from the dampness until some other day after the rains had gone away. Tanoa was as faithful as could be, but his intelligence was not such as to startle.

But Talolo bore the scolding with an aggrieved air. His rank was not quite high enough for him to venture on answering Tonga back, yet it was not sufficiently removed below her position to preclude him from at least looking the things he might not speak.

"True it is, Tama'ita'i, that the lupe are far away in the great swamp on top of the mountains and they are no longer good to eat. And when the rain is heavy on the waters you cannot fish after the way you fish, but only as the Samoan women fish, by wading in the water with their nets. But on the back of the island there is a cave that they say is filled with birds that live in the darkness and only fly out for food. You might take fire sticks and shoot them and thereby I might get the dollar for my Christmas gifts."

"Still you are a fool boy," exclaimed Tonga. "How shall the Tama'ita'i cross over the mountains to Falealili in the rains when scarcely will a Samoan venture on the Ala Sopo road? And besides, those birds that you know nothing of are little swallows not fit to eat, and you need not shoot them, you can kill them by the hundred with a switch."

"It is all true," said Tanoa, "in the Vaipalolo there is no animal to pursue nor fish to take, the only thing is the robber crab."

Talolo was quick to see his opportunity. "Tama'ita'i, will you give me the dollar if I take you to hunt the Uu, the crab that steals our cocoanuts?"

No less prompt was Tonga in deprecating the suggestion with an angry glance at Tanoa for making it. "You must not go to hunt the Uu," she said. "If it should fall on your head it would kill you dead extremely. If it should hit you with its claw it would break your leg. Such hunting is only for strong Samoan men, it is not for a lady. Besides, you will get very wet in the rain."

And Tanoa tried to square himself with Tonga for the unfortunate suggestion. "It is not well to pursue the Uu," he said, "for it can only be done at night and then the aitu are in the bush and it is not well to have the aitu hurt you, for then you die and perhaps wander a weary road."

Waving aside this domestic opposition, to which I was well accustomed, I asked Talolo if for the dollar he so much wanted he would undertake to bring me face to face with the robber crab, ghost or no ghost. He accepted gleefully, only asking for delay sufficient to enable him to learn from old Lauta when the moon would be right for the capture of the giant crab. It might prove an interesting branch of astronomy for somebody to study out the connection of the moon with the affairs of Samoa. My experience has been that everything I wished to do in the forest or along the streams had to be regulated by some sort of lunar calendar, of which only the very old men, such as Lauta in particular, were fully informed and had to be consulted for some such fee as a box of matches or enough kerosene to fill their lamp.

While Talolo is off in the rain consulting the elders as to what the moon says about the hunting of robber crabs, one may try to form some estimate of whether Talolo was really a sports-boy or only a meat hunter. It must be confessed that when he went after game he deemed it absolutely essential that at the appropriate time he should be found with the goods on him. I can count up dozens of times when Talolo has led me to the killing of things for which I could make no sort of use, but which proved acceptaable to the housekeeping of Chief Patu and Salatemu and Talolo himself as a junior of that household. But that is, after all, a very narrow view to take of Talolo's hunting. It soon broke upon me that Talolo's sportsmanship was brought best into play before ever we started out on our many expeditions. Talolo was after better game than fur, fin or feather, and I was it. His skill in stalking me, the way he baited the ground to which I was to be led, his absolute ingenuity in devising the always changing lures—all these stamp Talolo as a clever sportsman. His unfailing cheerfulness when I broke away from his best laid schemes, his readiness in devising new attractions—all these things showed that he played the game for the pure sport of it. If I was his game at least I was appreciative of his skill. This is a season when one can say this sort of thing with all peace and good-will. Those who have become acquainted with other of my adventures with my happy little Samoan companion may have seen through his little game; this is said only by way of serving notice that I, too, was not unaware of the tricksome devices with which he made his own tiny profit while giving me such rich pleasure afield or afloat.

After no long absence Talolo returned with a supply of information. Being as he thought on an official errand he had to be equipped with a raincoat and an umbrella,

and was accordingly proof against the weather, and on such a day there was no difficulty in finding all the old men sitting together and plotting rebellion or playing "svipu" or cassino, the one occupation being little more dangerous to the peace of the realm than the other. All the ancients had told him that a Papalangi woman had always very absurd ideas, but that if she insisted on hunting the robber crab the proper time was "fanaeilele," being the fourth night after the full of the moon. Samoa under the rain clouds had not caught a glimpse of the moon for nearly a month, but the almanac established the astronomical date of the full moon, and to Talolo's great glee it was found that that very night was "fanaeilele," and, therefore, it was now or never for crab hunting.

It was by no means the first that I had heard of the Robber Crab or the Purse Crab, as the beast is sometimes called. At the foot of many a cocoanut tree along the beach I had seen a hole about as large as a woodchuck burrow and presenting much the same appearance. These I had been told were the burrows of the robber crab, and that on general principles it would be just as well to leave them alone, for while the inmate was supposed to sleep by day and to confine his efforts to the night hours, still he might wake up if one should slip into such a burrow at any time. Just to test the facts in the case I jabbed a stout stick into one of these burrows and woke up the occupant. He was evidently annoyed at being aroused from his nap, for the stick was seized so roughly as to wrench the other end from my grasp and when, after a few minutes of mauling it, the stick was thrust out of the burrow the end of it was chewed to splinters. It was quite clear that this crab was no child's play.

Invisible by day the crab roams about at night and finds its food on the cocoanuts. If the supply of windfall nuts is deficient (and in the neighborhood of Samoan houses every fallen nut is promptly picked up to be cut for copra or used in cooking), then the crab climbs the trees and wrenches the nuts from their stalks and collects them from the ground afterward. One of the tourists, those who in a stay of six hours on the beach while the steamer rolls at anchor equip themselves to speak as one having authority on Samoan affairs, has gravely recorded an interesting addition to this observed fact. The gifted author goes on to say that if the fall from the top of the tree does not crack the nut open the sagacious animal seizes the nut in its claws, reascends "to a higher branch of the cocoanut tree" and drops the nut again, and rarely without success. The value of this statement in natural history will become promptly apparent to any person who will stop to recall that the cocoanut tree has no branches whatever, and that fruit and leaves all grow at the same level.

When the appointed time came that evening Talolo, as the master of the hunt, announced that he was ready to lead the forces on to do battle with the fierce robber crabs. The place where we were to hunt was in the unoccupied land of Taumeasina, just across the little river Fuesa on the eastern edge of Vaiala and between that stream and the Vailoa which separates it from Matafangatele. When Tonga heard this she promptly decided to forego the hunt for several very important reasons grounded upon the weather and the state of her health. These were merely pretexts, for I happened to know that Taumeasina was the chosen romping ground by nights for a swarm of aitu ghosts or demons of Tonga's own family, and that she would rather die than cross that half mile strip in the dark. Tanoa never was any sort of use after nightfall in his terror of the demons, and was going through the motions of a deadly attack of sickness in order to make it plain that he must be left behind. But there were other boys who were ready to face the elements and the aitu for a prospective supply of beef and salmon.

As to the weather conditions it need only be said that it rained. That rain had begun only two weeks before and was good for yet another week, therefore, it is not to be supposed that it would let up for so trifling a thing as a hunt by night. In Samoa one loses the habit of postponing things until it has stopped raining. The only thing to do is to put on a slicker and go out in the wet.

Thus we set out in the driving rain, myself in waterproofs and the Samoans in an extra coating of oil on their skins to serve the same end and wearing their oldest clothes. As we went through Vaiala along the road and saw the gleam of light upon the falling rain where here and there a ray escaped through a chink of the closely drawn mat screens, the boys raised the hunting shout, but those who were dry and under cover were too wise to part the screens and give us response.

But as soon as we had crossed the shaking foot bridge over the Fuesa and entered the debatable land where we were to look for our game, Talolo forsook his forward position as leader of the expedition and found it less terrifying to stick close to my side. Not that he said so; nothing of the sort; only it took no great powers of reasoning to see through his flimsy pretense of wishing to point out the rifle pit where Laulu with Tonga by his side fought the Germans to a finish in the fifth war before the last. Just as though one could see a pit in a pouring rain and inky blackness. The other boys were quiet too, but it was less on account of the aitu—luckily Taumeasina is peopled with Matafangatele aitu who have very little to say to Vaiala folk. The silence was rather that their quick ears might catch through the steady beat of the rain on the cocoanut leaves overhead some other sound familiar to their trained ears which should reveal the aerial presence of the game we sought. So far as I was concerned there was nothing to hear but the unremitting drumming of the rain on the sonorous leaves overhead and the roar of the overburdened barrier reef a mile off shore. But in no long time I felt, for in that tumult of gale and darkness it was impossible to hear or see, I felt that the boys had gathered about a certain tree. Talolo led me to its trunk, and in some way I found myself with my ear against its trunk listening. I could hear another sound than the voice of the storm, it sounded like some heavy body scratching its way over obstacles. All at once I recalled what Tonga had said about the crab falling on me and "killing me dead extremely," and I lost no time in moving out of what I regarded a danger zone. A few feet away the boys found another tree that promised game. Between these two trees the boys divided themselves and Talolo and I took our station midway between them ready to join whichever group should offer the better promise for sport. For all that he was a little savage and brought up to that sort of thing, the graceful little hand that crept into mine was cold with more than rain, and brought to mind the fact that Talolo was only a boy after all, and was earning his Christmas dollar rather hard.

After a certain period of inaction during which the blackness of the night prevented me from seeing what was done, the surroundings were suddenly illuminated by the glare of torches, which we had brought with us in plentiful supply. For such a rainy spot Samoa has the corresponding advantage that the dry leaflets of the cocoanut furnish a torch that will burn in all weathers. Then in the bright light I saw that the boys had climbed each tree about half way to the top, and there had tied a bunch of grass about the trunk. This, I learned afterward, is a risky thing to do, for the crab is likely to become aware of the man climbing the tree and to start to climb down to meet him. In that case there is nothing for the man to do but to scramble down to the ground and light his torch, for the enraged crab will attack anything that is in the way of its refuge underground.

As soon as we had light on the scene the boys began to shout and throw sticks and stones into the crown of leaves on each tree. The light, the noise and the direct assault were too much for first one crab and then the other, while in the outer ring of darkness we could hear the rustle of other crabs that were scurrying out of our dangerous neighborhood. In the tree on which the brighter light was cast I saw the leaves move apart and then, while the Samoans set up the cry Uu to name the beast, I saw a huge misshapen creature start to climb down the tree. Just how we were going to catch it I did not know, for when Talolo gave me a stout club as the others carried he assumed that the knowledge of what to do with a club came by instinct. With every foot that the crab climbed down the tree he looked less and less attractive for a close encounter and I became quite sincerely regretful that my particular club was no more than a yard long, that seemed momently to be an absurd sort of weapon against the giant crustacean. But the crab while making steady progress down the tree was equally cautious. He never let go his hold with one claw until he had made sure that the other three which were capable of such use had secure holding. At times he managed to secure a grip with one or the other of the huge front nipping claws with greater powers of pinching than any lobster ever dreamed of. Thus foot by foot the crab climbed down, not slowly, but deliberately. At length he reached the twisted clump of grass about the trunk. Then he let go all holds and came down by the run while Talolo led the shout of the kill. With a shudder I appreciated just what Tonga had meant, for the beast struck ground with a smash that would surely have laid out any merely human person that chanced in the way. One of the boys rushed forward to the crab and then we saw that it had been killed by the fall, the soft parts of the body being crushed to a jelly. Scant attention was paid to this victim and all the party drew closer to the other tree, down which an even larger crab was crawling. As soon as it reached the grass band this crab, also, dropped off and came to the ground. Whether this one fell on a harder part of its shell or whether the fall was broken by some low bush I did not notice, but this beast was thoroughly alive when it reached the ground. In an instant we were a ring of shouting humanity about the great crustacean and I could see that the trap having failed there was nothing for it but a sheer fight in which clubs were matched against claws that certainly could break a leg if once their blow were delivered. As well might one attack a battle ship with a crowbar, except for the one weak point of the animal. While it is heavily armored in front, the abdominal rings of the robber crab are soft and provided with only a leathery hide. It was through falling on this that killed our first Uu. This other and very lively one knew its weak spot as well as any, and in a flash he backed up against the roots of the cocoanut and secured the protection he did not own. With a torch in one hand and a club in the other the boys rained blows upon the fierce fighter. After several minutes of this kind of rough fighting a lucky blow on the soft parts dispatched the crab, and we trudged homeward with the catch and with our torches alight, as is the right of successful hunters.

Talolo took one of the Uu, and there was nothing to choose between them, saying that that one was the due of the chief and people of Vaiala. The other he carried to the Consulate and turned over to Tanoa, now miraculously restored from his illness and welcoming me with all the proper speeches. Tonga was ready with dry raiment, a thing which I had not thought of, for as soon as the robbers began to climb down their trees I lost all consciousness of the fact that it was raining.

Tonga and Tanoa explained that this was the usual way of catching these crabs. As soon as they reach the grass upon the tree trunk they think they have reached the ground and let go.

Tonga took the crab home with her, for she said that it was not of high enough rank for my use, an old pretext with her when she wanted something. Still before I yielded to her request I had Tanoa take the axe and chop off one of the two-foot long front claws which looked meaty. I had it cooked in the morning. The claw turned out to be mostly shell and what meat there was was oily and rank in flavor. The Samoans eat the meat and from the soft parts extract an oil which is used for sprains and other bodily aches.

Incidentally it should be said in conclusion that Talolo got his Christmas dollar and was able, no doubt, to make his presents as profitably as he had hoped to do.

Llewella Pierce Churchill.

The Doctor Ought to Know.

The physiology class was up, and the teacher asked, "Where are the bowels located?" A number of hands went up. "George, you may answer." George promptly put his fingers on his pulse and answered, "Here it is." "Oh, no," said the teacher. I asked, where are the bowels?" George insisted, "Here it is," and he added, "When you are sick don't the doctor put his fingers on your wrist and say, 'How's your bowels?' He ought to know."

The Passing of the Sledge-Dog.

The gradual disappearance of the sledge-dog, and so of dog-sledging, in the northern quarter of this continent, is worthy of more than transient notice. For, fifty years ago, the dog-sledge supplied in winter months the chief means of transport and travel throughout this vast region. North of a line parallel with, and but little above, the upper reaches of the Missouri, and extending northeasterly from its eastern border of the Dakotas to the Atlantic, the sledge-dog was from mid-November to mid-April the common beast of burden.

Compared with existing conditions, the demand for transport in this area was, of course, meager. The region was thinly peopled, the occupants being Indians and half-breeds, the servants of the great fur companies and the "free," or independent, fur traders. This population was, however, largely nomadic. The natives frequently changed their places of abode, were constantly engaged in the chase, and so required a considerable amount of transportation. The fur traders, though conducting their heavy traffic during the summer months by boat and horse carts, had to maintain communication between posts and outposts during the winter. Add to this journeying the hauling of packs and the volume of travel and transport throughout this region bulked very large.

The burden of it fell upon the dog. Horses then were in fair supply. But the heavier animal sank in the snowdrifts and slipped on or broke through the thin ice of the streams and lakes, and was speedily worn out. Beside, in its lack of supplies of grain, it was difficult to provide him with food. Hay could not be carried in bulk, and the time allowed for stops did not permit of extended searchings under the snow for dry grasses. So the dog passed under the yoke. If he was not as strong, he could still haul more than his own weight, could on the hard snow-crust travel faster and further than the horse, and could easily be supplied with food. He required no picketing, did not stampede at night, nor have to be searched for in the morning. Further, he was at once a companion and protector of his master.

But it was hard on the dog. With the instinct of his wolfish forebears still strong within him, he clung to his freedom with a fierce tenacity. In hauling a sledge he did something from which his whole nature revolted. It is true that among natives the toil and burden of the "travaille" had been his since the aborigines began their long march northward from the central continent. But the two long poles tied to his sides, like the shafts of a cart, and dragging upon the ground, across which was laid the impedimenta of the Indian camp, made only occasional breaches in his liberty. The journeys were not likely to be long, and were, moreover, eminently social. Though every day bore a load, he marched with the women and children, a barking, chattering throng.

On the other hand, the sledge was, in winter, in almost daily use. The journeys were, many of them, long, the pull heavy and continuous, the march apt to be solitary. There was little of the rivalry in progress to be found in a pack of "travailles.' The sledge-dog faced the illimitable horizon across a wide waste of snow, day in and day out, alone, and with, to him, no end in view. Save when the snow was deep, and the driver tramped ahead to beat down a path with his snowshoes, the dog led the way. He must keep straight on in the teeth of a storm, against which every other animal turned tail, or feel the sting of his master's lash. And at night, after bolting at a few mouthfuls his meager supper, he must curl up about his driver's blankets and act as buffer against the blasts.

Against all this the dog made vocal protest. But savage life knows little pity for animals, and submission was induced by the lash and the club. What a pathetic array of bruised and battered heads—heads with ears torn, with eyes out, and skin disfigured—the memory of long journeys conjures up! But from a little north of the Missouri to the Arctic line every dog big enough bent to the collar.

In the great region covered by dog transport, the Eskimo, or "Huskie" dog, was for many years the prime favorite; though the Indians used, as they still use, every dog, either in sledge or as pack animals. As known in the interior, the huskie was a medium-sized dog, weighing perhaps ninety pounds, but possessed of far more endurance than the ordinary ruck of mongrels. A bushy-tailed, fox-headed, long-haired animal, with erect, sharp-pointed ears springing from thick tufts of fur, there could be no mistake as to his kind. His chief defect was his short legs. In the coast region, where the snow crusts hard, this was not a serious one, but in the softer snows of the interior it greatly impeded progress.

What was needed was a long-legged dog of good weight; and in time this animal began to appear. He was the result of cross-breeding between the huskie and the deerhound, stood considerably higher than the former, and in weight ranged from ninety pounds to one hundred and twenty pounds. As, apparently, he owed his existence to the experiments of the fur traders along the middle reaches of the Mackenzie River, the breed was known north of the boundary line as the "Yukon." It was by long odds the best produced by the necessities of sledge transport. With all the endurance of the huskie, it combined speed and pertinacity of the deerhound. With a single train of four of these dogs an officer of the Hudson's Bay Company traveled continuously from Fort Simpson, on the Mackenzie, to Winnipeg, a distance, by the route taken, of twenty-four hundred miles. Another officer made the same journey with a single train by a route twenty-one hundred miles long in forty-six traveling days. Naturally these dogs were highly valued, the possession of a superior dog-train being a matter of no little rivalry among the fur traders. Prices ranged from $25 to $30 per dog, and rose as high as $50, and a good train of four dogs readily brought $100.

The supply was, however, necessarily limited. Away from the coast regions neither the huskie nor the Yukon breed came into general use, being owned for the most part by the "free-traders" and the traders of

the fur companies. The bulk of sledge transport was always supplied by the mongrel, and mixed breeds, with no distinctive type predominant. Mostly they were of the ordinary Indian kind, very wolfish in appearance, with sharp muzzles, pricked ears, and straight wiry hair. They ran the gamut of color, though a kind of blue-gray with black spots was very common, and accompanied a rather bad temper. In all dogs weight was, of course, essential, an animal under seventy pounds being too light for freight traffic.

Owing to the exigencies of its service, passenger transport by dogs reached its highest development through the Hudson's Bay Company, that great chartered corporation which for so long a period governed as well as commercially exploited the northern quarter of this continent. Successful supervision of its scattered forts and trading posts necessitated communication during the winter months. With frozen rivers and lakes, and the general lack of roads and trails, the dog-train was the only method of travel. Then, too, its hunters often required rapid transport, and once every winter the "packet" started from Fort Garry on its long journey northward, carrying the mail to the isolated posts, to stop finally at a lonely station within the Arctic circle.

At its best the passenger train was composed of four dogs, the word "train" applying in the north only to the dogs. They were attached to the usual toboggan-shaped sledge, covered with skins or heavy canvas, and so stiffened by bows and a back as to resemble a heelless shoe; the bottom projecting behind the seat sufficiently to give space for baggage, or afford the driver standing room when weary from running. Many of these sledges, or carioles, were highly decorated with paint and pigments, and the interior was always made comfortable with robes and blankets.

A DOG TEAM RESTING.
From "Hunting in Many Lands."

The method of harnessing dogs differed somewhat with locality, the Eskimo running their dogs abreast, and other natives attaching them by separate lines into a band or pack. But throughout the great interior dogs were driven tandem, and harnessed between two long traces with a space of a foot or more between them. A round collar of soft leather fitted closely to the shoulders, and buckled on either side to the traces, which were supported by a band passing over the back. Both this band and the collar were made the subject of a good deal of decoration, being often hung with tiny bells, or ornamented with ribbons or fox tails. A train of good dogs thus gaudily appareled, with a blue cariole, from the back of which a fringe of red blanket appeared, and a driver with tasseled fur cap, dark blue capole, a red sash, beaded leggings and moccasins, contributed greatly to the warmth and color of the landscape.

In passenger travel the driver usually ran alongside the sledge, for it seldom happened that the passenger was also driver. Only the most thoroughly trained dogs could be driven from the cariole; attempt to do so with the ordinary train generally ending in an inextricable tangle, in which the leader took the place of the "wheel" dog. With a driver to keep the line straight, and ready to meet any deviation with whip and imprecation, progress was easy enough.

The rate of travel on a fair track, or on the snow crust, was from five to six miles an hour, though much better time was frequently made. A "company's" officer told the writer that he once made fifty-five miles without stopping in seven and a half hours, his passenger being a lady with her trunk, robes and day's provisions. And he said that he had known dogs to trot twelve miles an hour without breaking. But such speed is exceptional.

In traveling start was usually made at three or four o'clock in the morning, with a stop between seven and eight for breakfast and another at noon, the day's journey ending between four and five o'clock in the evening. The best progress was made, however, with a half hour's rest every four hours, during which the dogs were taken from the harness and allowed to roll in the snow, a comparatively easy matter; every dog being trained to come to his own collar when called up. Few spectacles appealed more strongly to the imagination than that of a dog train passing low down upon the horizon across the snowy plain, to disappear at last, a mere speck against the blue. It was a picture of human life—the advent, the brief passing, the speedy disappearance; and like the going down of a ship upon the sea, it magnified for the onlooker the feeling of infinite solitude.

It was in the night camp that the sledge dog again came to his own. The day was for him only a long-drawn misery, relieved by the few fugitive joys of his resting spells. Loosed from the cariole, his old instincts, tempered by circumstances, reasserted themselves. Like the retired green grocer who builds a rockery in his backyard in the effort to return to nature, he essayed to assert his freedom by vocal challenges to his fellows, wanderings about the camp, and suspicious sniffings of the snow, as if game were somewhere concealed. This until the fire burned. Then came a sudden metamorphosis. For with the blaze the sledge-dog became statuesque and intently expectant, sitting rigidly upon his haunches, his eyes fastened upon the row of frozen fish thawing before the coals, and consumed by a fierce hunger. For supper was for him the only meal of the day. Each dog received two fish—about seven pounds—as his ration. There were no pleasures of deglutition. Like its dinners, which Thackeray described, when men met only to eat, the meal was served in a single course. A few gulps and swallowings, a wistful sniff or two, and the sledge-dog curled down upon the snow as, in beating down his nest, his wild ancestor had curled in the long grasses of the prairie. As the hours wore on, and the stillness and cold of the northern night settled over him, he sought his master's blankets, edging closer and closer until driver and dogs became an indistinguishable heap. At times some grizzled leader, answering the howl of a vagrant wolf, roused the camp by his hoarse baritone. But in the main only the imprecation of the driver, as he resented the too close encroachment of the dogs, broke the long silence.

In freight hauling much the same routine of travel was followed. The vehicle was, of course, a much simpler affair, the freight sledge being the usual toboggan, save in the coast region, where a low, very flat runner was not infrequent. In each cords passed along the edges by which the loads could be tied, or, rather, laced down; the closer the weight lay to the snow the easier being the labor of both dogs and driver. Usually the latter maintained the equilibrium of the load, and prevented overturn by a cord attached to the rear of the sledge.

A good dog on a beaten track could haul about one hundred and fifty pounds, and for a short distance might do even more. On a journey of, say four or five days, four hundred pounds for a train of four dogs, with fish at the rate of seven pounds per day for each dog, kettles, ax, blankets, etc., was considered a fair load. With this a train could travel on the snow crust or hard road, at a rate of four miles an hour. In soft and deep snow, however, the rate was scarcely more than half that, the drivers having first to walk ahead and beat down a path with snowshoes in which the dogs could follow. As the loaded sledge sank deeper than the track thus made, it was indispensable to progress that the dogs got a foothold upon the ground.

Moreover, continued travel in deep snow was apt to make the dog's legs sore above the ankle, and to diminish his speed and endurance. In the spring time the brittle snow crust cut both the dog's feet and the driver's moccasins; a disablement guarded against in the case of the former by putting him in shoes. These were merely pieces of soft leather or cloth secured about the ankle with a thong, but which for the time constituted an effective protection.

Generally speaking, however heavy the pull and difficult in trail, the dogs performed their task with a degree of equanimity, not to say resignation, which, considering its arduous and repugnant nature, was much to their credit. There was very little fighting, and that little generally among newly made-up trains, when the places of the dogs were changed, or when the leader engaged in a quarrel. Dog nature resembles human nature, in that it is suspicious of strangers, and resents a change of position which involves harder labor or reduction in rank. Many dogs, too, will not work well except in the lead, a trait not wholly canine. Once acknowledged, all sledge-dogs respect the leader, follow him and fight for him, even out of harness. Some dogs are, however, naturally very stubborn, and seem never to be reconciled to their task. Very few can be trained to the sledge without severe beatings.

As was inevitable with a people given to nicknames, dog nomenclature throughout the north, and especially among the half-breeds, formed an extensive vocabulary. In the early days the dog was named after his owner, after personal traits, natural objects, or some battle or adventure in which he bad been conspicuous. But following the advent of the fur traders and the introduction of liquors, names for a time were those of various brands of drinkables. Of these whiskey, brandy and coffee attained the greatest popularity, and for many years it seemed safe to say that of every train two dogs at least bore one or the other of these labels. With the driver shrieking for whiskey and brandy, and the passenger calling for coffee, the cup of creature comfort at that time throughout the North would seem to have been full. As no custom hardens without a reason, it may be assumed that these names were chosen by men constantly exposed to cold and storm, as most suggestive of warmth and good cheer. With the advance of civilization, however, taste in this direction changed, and the sledge-dog took the names of great statesmen and cities—Bismarck, Gladstone, London, etc., and with the Scotch fur traders that of national heroes, Bruce, Wallace and the "Scots wha hae."

But whether named or not, the half-breed driver never lacked appelations with which to urge on his train. He was never at a loss for invective or phrases descriptive of his opinion of the defects of particular dogs. And no dog ever entertained a doubt as to who was meant when they were applied. The profanity of the half-breed driver was delivered with a shot-like precision which never missed its mark, or failed to awaken renewed effort; and his general appeal to the train to "just see if they couldn't do a little better," with marginal references to their ancestry, had all the effect of the lash.

It was not until the year 1880 that the decline of dog-sledging became pronounced. It is true that in the middle region south of the fiftieth parallel, it had, previous to that date, suffered some eclipse. The opening of roads and trails, and the gradual settlement of the country, had brought the horse increasingly into use in winter travel. By the latter year the process was being repeated in the Canadian Northwest, and especially in the great plains south of the Saskatchewan. The settlement of the Indian tribes on reservations tended further to diminish the work of the dog, by circumscribing the wanderings of the Indian hunters.

In the north, however, the dog-sledge still held its own. But gradually, even there the whistle of the steamboat was heard upon rivers which, since time began, had borne only the birch bark canoe and the macinac boat. Little settlements sprang up here and there, roads and trails were opened to connect them, and in winter the horse sled took the place of that drawn by the dog. Greatest blow of all was the discovery of the Alaskan gold fields, and the consequent opening of great arteries of travel to the north. In the eastern coast region the dog-sledge remains, and probably will remain, the ordinary means of winter transport. But in the great central area and the western coast the horse vehicle has largely taken its place. Only in the Mackenzie and English River districts, and in Alberta, is the dog still in general use.

It was a picturesque phase of aboriginal and pioneer life that is thus passing away. There was no more novel and animated spectacle than that of the dog trains, with their gaily-colored carioles, tinkling bells and smartly dressed drivers gathered in the fort yards for departure. It was a moment of much cheer, of laughing and gesticulation, of handshaking and wishing of *bon voyage*. And when Pierre and Baptiste and Louison set sail with their little craft out upon the limitless expanse of snow, what a shouting of adieus! On they went, little lines of light and motion, crossed by other lines going east, west, north, south, bearing the travel and commerce of a fourth of a continent, and bringing cheer to the hearts of men. But the utilitarian has ever waged war with the picturesque; and the dog-sledge with which the *coureurs des bois* penetrated the great region west and north of Lake Superior and opened it to settlement, is disappearing in the struggle. The dog has had his day.

H. M. ROBINSON.

Long Island Ducks.

BAYPORT, L. I., Dec. 20.—The past week since the thaw set in has been better for gunning than at any time before this season. Redheads are in the bay in large numbers. Brant and geese have also been seen, though as yet I have not heard of anyone getting either. The quail shooting has been very good for so late in the season, which closes here the first day of January. Mr. G. Still, out one day last week, got 21 quail, 2 partridges, 2 rabbits. Guide Will Brown on Thursday got 51 broadbills, 3 redheads, 3 coots. On Saturday he had out Mr. Such, of Perth Amboy; the weather was not very favorable, and they only got 17 broadbills and 4 redheads.

Guide Le Roy Still was away on his sloop two days and returned Saturday with 85 ducks, including 16 redheads, most of which he got point shooting, the ducks coming right inshore and stooling good. Rabbit shooting has been quite good; Will Bason, of Sayville, on Monday last got 17 and Mr. Sharp 12. Will Clock and party, of Islip, on Monday last got six fine wild geese.

HENRY STOKES.

W. T. Woodward, a La Crosse attorney, has drafted a bill, which he will present to the Wisconsin Legislature next winter, the purpose of which is to prevent the telling of "fish stories." The bill provides that every fisherman must, under penalty of fine, register the weight of every fish taken exceeding one pound in weight. It provides for the appointment of a State officer, with county deputies, with whom register shall be made, and whose duty it shall be to see that the law is enforced.

Notes, also Observations.

Editor Forest and Stream:

I propose to give you some notes on the rattlesnake and squirrel, and perhaps some observations about other matters.

There has not yet been an opportunity to determine at what temperature the rattlers become completely torpid. We had a minimum thermometer of 30½ degrees night before last; but when the snakes were observed the temperature was 33 degrees. They were then quite inert, but with consciousness and some power of movement A few days ago, the weather being damp and chilly, though the temperature was not lower than about 40 degrees, I brushed off some straw from the larger snake with my naked hand, and stroked his neck a little with my fingers. His only recognition was a feeble movement of the tongue and a slight squirming of the body in his coil.

This looks like undue temerity; but I was quite certain that his nerves were not keyed up to the striking point, aside from his disinclination to strike at familiar objects without severe provocation. Some days ago a lady approached the box to view the reptiles. The day was warm and bright, and the snakes rather lively. The lady wore a large hat and a striking costume. Joseph became very much excited, put himself in an attitude of defense and sounded his rattle vigorously, which he had not done before for some weeks, or perhaps two months.

When the rattlers have become completely torpid, I propose to subject them to a quiet decapitation, as I shall have no further use for them, except to dissect their heads.

The pet squirrel has grown to be a "big boy," but is as saucy and badly spoiled as ever. He assumes the privilege of interrupting me at my work whenever he pleases, compelling me to quit, and romp with him. He makes vigorous onslaughts upon my fingers, with ears laid back, apparently intending to bite through; but always restrains himself, and does not bite hard enough to hurt. A little girl, three years old, came to see the squirrel, and I expected mutual pleasure between them at their meeting. But he showed a decided resentment at her approach, ran off and concealed himself in his den, and could not be coaxed out while she was present. I then reflected that he had never seen anybody but men before. He also shows his disapproval of the occasional presence of ladies by remaining in retirement during their visits. He was coaxed into approaching a lady's hand for a nut held between her fingers. He approached in a nervous, jerky fashion, scolding all the while, with his tail well advanced before his nose, which I have observed to be his custom when curiosity impels him to approach an unfamiliar object. He seized the nut and galloped off with it, still scolding at the lady as he retreated.

Now for some natural history notes.

This squirrel has never heard another squirrel bark, unless in his early infancy. He has developed an utterance of his own, differing in form from that of his kind in a state of nature. He uses his forepaws exactly as hands are used, grasping and holding on to small objects, lacking only thumbs to having perfect hands.

He has a habit of "washing" his face with his paws, after the manner of a cat, and uses his tail as a towel, to wipe his countenance with. He invariably seizes his tail near the root and runs his nose rapidly along it to the end, rubbing the while vigorously with his paws.

His heart-beats are of extraordinary rapidity. While reposing on my shoulder, my ear resting against him, I took my watch to count the pulsations and time them. I could count only as high as ten, and then begin again at one, as I could not repeat fast enough, even mentally, the dissyllabic numbers above ten. I made out eight times ten beats in ten seconds, or eight beats per second—480 beats per minute, while in a normal state of repose. I did not suppose that the heart action of any creature was as rapid as this.

And now for my "observations."

I suppose that my good friend Mr. Jos. W. Shurter, will expect me to say something about his last remark about not dumping the barrel of pork into the bayou. I will do so briefly. "Objected to as irrelevant." It cannot be supposed that the man who should own the barrel of pork would decline to sell it for say 25 cents a pound, merely because he himself had butchered the hogs. Not to pursue the argument further, I will merely "mention a circumstance." There is a lake in the adjoining county of Tunica, called Swan Lake, about forty miles from here, mainly by rail. I was informed that this lake is a great resort for ducks in season, and the shooting there very fine. But the lake is almost completely occupied by a tall, coarse grass; so that it is impossible to recover the ducks after killing them. For that reason the lake has no attraction for sportsmen, and is never visited by them, although only four miles from a railroad town. Corollary: There is no "sport" in shooting ducks unless they can be had in possession after killing them.

Observation No. 2: I have occasionally been imprudent enough to "put in my oar" in other people's controversies toward the wind up, for the purpose of "pointing a moral," or deducing an abstract principle; and have sometimes got myself into hot water by so doing, as witness Mr. Shurter. The late dispute between Mr. Converse, Mr. Brown and others, about the "Vermont Mode," affords another opportunity for a similar experiment.

I believe it may be truthfully said that the proper mode of hunting game of any kind in any country is purely a "local issue." Different methods of hunting in different countries grow up naturally, as it were, as the result of environment. Under the compelling influence of local conditions, sportsmen in the South, and in Old England, hunt their foxes in a certain way because the physical features of their country are favorable to that way. Likewise the New Englander, without indulging in any sentimental theories on the subject, simply and naturally adjusts his method of fox hunting to suit the physical conditions by which he is surrounded.

It is difficult to understand upon what ground the right is claimed by a sportsman of Pennsylvania or of Mississippi, or any other State, to dictate to New Englanders, either how they shall or shall not hunt their own foxes, or to bar them the right to call their mode "fox hunting." If it is not fox hunting, what is it? As the illiterate man said, "If n-a-t does not spell nat, what does it spell?"

It would seem that the Vermonters, who have developed a "mode" of fox hunting to suit the con-

"Then veteran Cap winded a bevy."

ditions of their country, have the same right to apply the obvious and non-copyrighted term, "fox hunting" to their sport, as have the sportsmen of other countries, who have done the same thing after their lights.

As regards the proper or improper way, of accomplishing the destruction of the fox, the view we may take, like all other purely sentimental questions, depends altogether upon what we have been accustomed to. Our method is the right one; all others are wrong. And here, we are apt to indulge the delusion that the estimate we form upon this question has relation to the feelings and sensibilities of the fox. That is a mistake. It is our own feelings and sensibilities that are consulted, not the fox's. The mode of killing the fox that we have not been accustomed to, may be revolting to us, because our own sensitiveness is shocked in its contemplation.

It would be difficult to say, if the fox were consulted, whether he would prefer to be killed from ambush, without warning, or smoked out of a hole, or chased to the point of exhaustion and then give up in despair, to be torn to pieces by the pursuing pack. Judged by human standards, the first method would seem preferable. But so far as the fox has

"He careful drew and stanchly stood."

given evidence of his views on the subject, the last method seems to be preferred. Certainly none of these modes of destroying our four-footed fellows in this vale of tears is nearly so cruel as keeping a bear or other animal four days at a time with his foot fastened in and lacerated by a steel trap. And yet I have never seen the propriety of doing so questioned—because we are accustomed to the idea; therefore it seems right.

COAHOMA.

Dec. 7.

Stubble Rhymes.—IV.

Warning.

When Scotia's bard sings Robert Bruce,
His verse flows on a limpid stream;
When Alma chants of Robert White,
His rhymes roll on a limping dream.

Prologue.

What madness drives us in the spring,
To whipping up and down the stream?
Or lures in autumn chill to seek
The quail with which the stubbles teem?
No fragrance like the meadows' breath,
No melodies like woodland tunes,
The rills and winds sing soothing songs,
Their music weds weird forest runes.
When hunger gaunt smites every son
Of Nimrod with a welcome pain,
How sweet the fare; and sweeter still
The fellowship in hardship's train.
What peace in "God's first temples" reigns!
What vigor in the mountain air!
What like communion with the hills
To knit "the ravell'd sleeve of care!"
The mountain brook with nectar flows,
Each hill and vale enchanted land;
Diana beckons to her shrine
With health and happiness in hand.

The Major rousing from the spell
Cast o'er him by the hundred four,
Said to the Colonel at the club,
"I find this social whirl a bore
And long to don my shooting coat
And shake myself from business free;
The Norman also has a mind
To take his gun and go with me."
"Now autumn's here," the Colonel said,
"I'll scatter lead o'er hill and dale,
And touch the woodcock on the head,
But sprinkle more on Bob White's tail."
"Why linger in the city's din?
I go to summon all the clan,
Blackstone and Æsculapius,
For pilgrimage to Michigan;
Where other days have seen such sport
As rarely falls to lot of man:
The quails are piping in the corn,
What think you, Major, of the plan?"
"The plan is good, the time is ripe,
To-morrow ere the sun goes down
Shall find us in a Pullman car
And speeding west to Almatown."

Sport.

The morning sun had barely rolled
The misty blanket from the breast
Of field and stream, when sportsmen four
Were sallied forth on merry quest;
Don coursing boldly up the slope,
With swinging stride Vic racing down,
The white dog and his darker mate
Are silhouettes on stubble brown.
They catch the faintly tainted breeze
And up-wind quarter well the ground,
Then careful side by side draw on
And stanchly stand; the quarry's found.

What strange contagion in the air
Has instant hushed the merry tone?
Men, dogs and birds are motionless
As images of graven stone.
The heart beats fast, life currents bound
Through every vein a torrid stream;
Nerves a-tingle, each muscle tense,
With bated breath and eyes a-gleam:
A moment thus, then from the heath
The covey bursts on whirring wing
To greet the thunder of the guns
And to their fire defiance fling.

"My gun at safe," "Sun in my eyes!"
Excuses buzz as thick as bees
When swarming wild in forest deep
And honey hunters fell their trees.

"All trigger fingers left at home?"
The Major asks—his fire retards
Till as they to the open flash
He cuts two down at fifty yards.
"However could you do it, G?
For shadows never swifter sped."
With merry twinkle in his eye—
"Crack shots are born, not made," he said.
"Could greedy guns attain that state
They would the game exterminate;
So that lime-lighted eminence
Diana holds in self-defense:
And sees afield no sadder sight
Than bristles on her chosen knight."
Then stooping by a pile of brush
Where steady Don did stanchly stand,
Discerned a Bob White 'neath a branch
And deftly caught it in his hand.
At words of praise his swarthy cheek
Blazed ruddy as a blackbird's wing
When o'er the marshes *Kink-cher-ee,*
Rings out a harbinger of spring.
Such skill and modesty and grace
Are themes the minstrels love to sing,
See Siegfried with the mystic hoard,
And then the Nibelungen Ring.

Once more the pointer ranging wide
O'er furrowed field to shady wood,
When by a clump of berry brush
Threw up his head and stanchly stood,—
Foot up, rigid, save twitching lip
And tremor slight at tip of tail;
What life and energy restrained,
Made statuesque by perfumed gale!
Behold the stalwart financier
With ready gun and purpose grim!
The wary quails that lay concealed
Made merry of the likes of him;
For as they flushed by twos and threes,
He promptly shot, but strange to tell,
Instead of bringing down the game
Did nothing at all and did it well.
Such shooting makes the maples blush,
Bluejays above with laughter scream,
While comrades look the other way,
And smiling ripples sweep the stream.
"Aha!" he cried, "those fleeting wings
Must be well loaded down with lead;
Let's follow them and surely find
A brace or two among the dead."
(No trigger-knight would e'en in thought
Accuse him of mendacity,
But simply free, unfettered by
Exactions of veracity).
"I'll *habeas corpus* two," he said,

The rest demurred and there remained
While dog and man the stubble scanned;
  Writ returned, demurrer sustained.
Then two strong birds were quick a-wing,
  As quick the Greener had its say
In two short words, and two fine birds
  Upon the frosted stubble lay.
Oh, what were loans and margins then!
  Notes, bonds and stocks were all forgot;

"More birds lie hidden in these weeds."

And still his eye with rapture beams
  At mention of that clever shot.

"More birds lie hidden in these weeds,
  There must be three unless they've run;
Come, Æsculapius, and do
  The little trick as should be done,
And show the clan the excellence
  Of treble-wedge, non-jar-off gun."
"After you, Alphonse," but forward stepped
  Unable to repress elation:
"A little dose of leaden pills
  Will give the quarry nerve prostration."
"Quite possible," the joker said,
  "Judging from your clear description
And rumors rife, such dire results
  Sometimes follow your prescription."
How close they lie! but such finesse
  Deceives not pointer, setter fleet.
"Whoa, steady, Don!" and "Mark, there, mark!"
  As whirring wings spring from our feet.
The jar-off to perfection worked,
  Birds flew as tho' a trifle late,
But that they suffered nervous shock,
  They and the papers failed to state.

Then veteran Cap, head high in air,
  Winded a bevy deep in brush;
The Colonel hurried to his side
Clearing all things in his stride,
  Hoping to reach him ere the flush.
He reached a frail and age-worn fence,
  Likewise age of indiscretion,
Well endowed with avoir-du-pois
  To make on earth a deep impression.
Vaulting ambition! This shooting star,
  Ignoring many friendly hints,
When rails collapsed saw other stars
  Besides the usual rainbow tints.
Though fallen low and prostrate he,

"Behold the stalwart financier."

  No sulphurous exclamation:
We all admired and counted him
  Wise in his degeneration.
Up spring the quails, the Colonel then
  Side-stepped so nimbly left and right
In looking for an open shot,
  Kept flies guessing where to light;
Till through a break in tangled vines
  A flash of wings uncertain, dim;
Then flashed the gun, down came the wing:
  Back benches were not made for him!
A smile played o'er his weathered face,
  He tapped the Daly featherweight;
"When quails are called to shuffle off,
  This will the pace accelerate."

Imagination eighteen fine,
  Have all sportsmen sans contention,
And are, when singing of their guns
  Pipe dreamers in the fourth dimension.
My dog, my gun, my fishing rod,
  In autumn sere and springtime green;
If only half that's told were true.
  What wondrous things this world has seen!
And it is well. The field-won health
  Which makes of life perennial spring,
Touches as with an artist's brush
  And roseate hue the common thing;
And implements inanimate
  Take on rare personality,
And charms unseen by other eyes—
  The sportsman's dear fatality.

And pranks! By gnawing hunger pressed,
  A farmhouse near with open door;
We entered in, friends not at home,
  The table spread with pies galore.
We feasted; then a card of thanks—
  This legend on a field of white
Was placed upon the ravaged board
  Weighted with coin of silver bright—
"Fair lady, this is not a case
  Of theft and inebriety,
A hunter's grace ere eating pie,
  Labels it piebald piety:
Or, since the crust was super-thick,
  Say upper-crust satiety."
And to this day with zest she tells
  Of honest hobos wandering by,
Who sat unbidden at her board
  But paid two prices for the pie.

No sooner were we well afield,
  Refreshed within and glad of heart,
Than strode a stranger vassal forth
  Inviting, urging us "Depart
And trample not these acres broad
  With sportsmen's feet, now hurry, start!"
(The corn-field wide, tossed in the sun
  To golden billows by the breeze
Was corn; the reach of mead and wood,
  Cloud capped, to him was grass and trees;
A woodcock by the brooklet's brim
  A timber-doodle was to him,

Bob White.

And nothing more. With souls so dim
  A sportsman's chance is rather slim.)

"So bos! If you're the manor's lord,
  Reproach us not so stridently;
Bad form! To roar like taurus mad,
  Degrades bucolic dignity.
Malevolence and raucous tones
  Mar pastoral tranquillity:
Is it not true that old blue jeans
  Sometimes conceal gentility?
The apple with the fairest cheek
  May often have a flavor tart;
The melon with the greenest rind
  May sometimes have the reddest heart.
Hie, home, show title deeds and speak
  Words dulcet, all-persuasive,
Your face adorn with smiles that tell
  Of good-will all-pervasive,
And you shall see how cheerfully
  Eastern chivalry and setters stanch,
(Not hastily with *sauve qui peut*)
  Will gracefully vamoose the ranch."

The answer soft turns wrath away,
  The ox-goad gently sinks to earth;
No Shamgar he to put to flight
  The Pihilistines but joins the mirth;
And game that wingless lendeth wings.
  To shekels bright is in his mind
As quails take flight; "A flush," one cries;
  "Not so," he says, "three of a kind,"
And dissipates dark anger's trace
  With grins enough to sprain his face.
Our farmer friends will never find
  True sportsmen willing trespassers,
Regardless of their vested rights,
  But always by-your-leave chasseurs.

When shadows long are eastward thrown
  And weary footsteps homeward tend,
A score of birds are counted out:
  Not much for four? A plenty, friend,
To nimrods careless of the bag
  But mindful of the vista grand—
The rugged hill, the valley sweet,
  The startled wing, the setter fleet,
The lights that play on sky and land;
  The music of the trees and streams,
Good fellowship and camp-fire dreams—
  Bird in the bush 's worth two in hand.

Cogitation.

Ah, poor Bob White! How full of grace!
  How quickly fled the vital spark!
Could he a better purpose serve
  Than for a sportsman's shining mark?
With healthful recreation give
  A morsel of the choicest food
For banquet, friend or invalid—

"Could he a better purpose serve?"

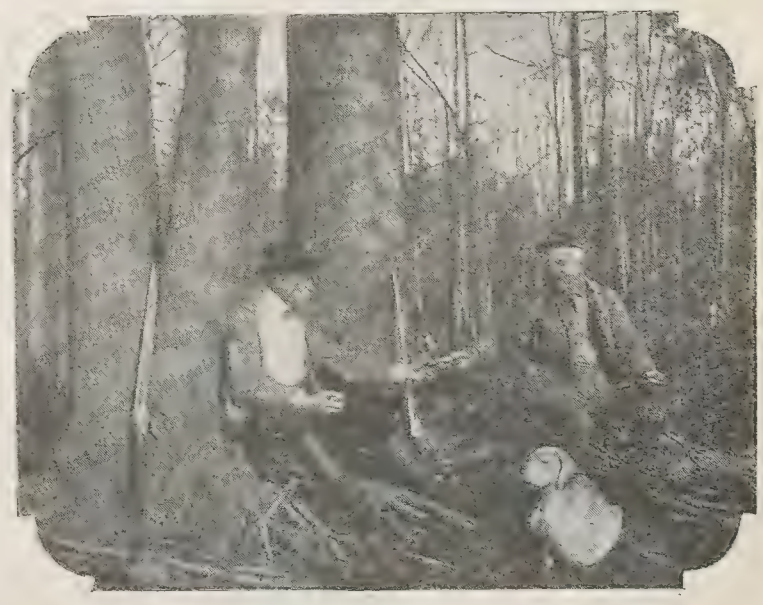
  Is there for him a higher good?
Pursuit of him makes all akin,
  The prince and peasant meet as men;
The season past and guns laid by,
  All hope to meet Bob White again.

Since wild life ends in tragedy,
  Let us invoke the tragic muse:
Come, then, pied piper of the field
  The manner of your passing choose.
Shall taloned pirate of the air
  Swoop swiftly on unerring wing
And strike you down, make your fair form
  Torn limb from limb, a mangled thing?
Shall velvet-footed prowler sly
  Slow let your blood with greedy fang?
Then crush your warm and quivering frame?
  Or, strangled by the snarer hang?
Shall winter's blast pile snow and sleet
  Where you repose on withered bloom
Asleep 'neath spotless shroud, then wake
  To perish in a crystal tomb?
Or wander far, alas! to find
  Your food encased in gleaming shields—
Starvation's lingering agony
  Upon the bleak and ice-clad fields?
Or from the stubble strong of wing
  To upward spring and skyward sail.
Swift passage to oblivion
  By sudden burst of fiery hail?

The rub—To shoot or not to shoot?
  The question burns but deep involved,
We pick his bones with repartee
  And leave the problem still unsolved.

Au Revoir.

From woodland green and covert gloom
All redolent with vernal bloom,
From waxing morn to waning light,



"When hunger gaunt smites every son
Of Nimrod with a welcome pain."

We hear his love-note, "Ah, Bob White."
When yeomen reap the fragrant meads
With chattering knives and patient steeds,
His merry voice makes labor light;
How cheerily he pipes "Bob White."
When groaning wains wend slowly by
To bursting barns, unseen and shy
For vesper hymn the little sprite
Chants through the gloaming still, "Good night."
When autumn's golden days are come
And sportsmen love the fields to roam,
His plaintive call-note rising clear,
The scattered bevy summons "Here."
His destiny not feeble age
But fadeless youth on printed page;
From merry days to festal nights
Served hot for prandial delights.
At reason's feast and flow of sense
He wings responsive eloquence;
The honored guest and genial host
Find none like him to grace the toast.
Let other bipeds emulate.
In life and death to man's estate
He adds health, strength and happiness;
His shadow, may it ne'er grow less.

ALMA.

Ways of the Night.

"A little nonsense now and then
Is relished by the best of men."

There are places where game abounds that are shown on no sportsman's chart; there are ways and means for its capture not laid down in sportsmen's publications.

One such case came under my observation and one such method was brought to my attention some years since when jacking deer was considered good form and had legal sanction. The place still exists, and as the method is somewhat novel and not likely to materially aid in the extermination of deer, with or without legal sanction, I may be pardoned for making it public now with attendant incidents and experiences.

Deer Bog—that is the place—but you will look in vain for it on any map, or in the advertisement of any camp owner whose seductive words are the net to catch the dollars of the tenderfoot and unwary sportsman.

Deer Bog, deer bog—rather a fetching name, eh?—and one likely to recall many stirring adventures of camp and trail.

Well, here it was one night in the rapidly lengthening years agone that two noble bucks paid the penalty of over-curiosity or over-confidence, or both.

The place? Oh, yes!—but I crave to be excused if I am not more specific—it is up in Canada in the Megantic Country, off toward the Boundary Mountains. Jack Boyle lives up that way—Jack has made many tours of exploration and discovery, and the location of Deer Bog is one of his secrets that I do not feel at liberty to reveal.

Jack is one of the many verifications of the old adage which says that "valuable goods are done up in small parcels." He is well versed in woodcraft, willing, cheerful, companionable; he can carry a good pack, is past-master of paddle and frying pan, and resourceful in emergencies. He is just the man with whom to share your camp blanket in the woods—and to him I refer the reader as the proper sign post to point the way more definitely to Deer Bog.

With a party of friends and guides we had closed the trout season in a blaze of glory on the head waters of the Dead River in northwestern Maine, and early the next morning we set forth upon the long trail over the mountains to take advantage of the opening of the deer season in Canada, Sept. 1. A soaking rain storm forced us to accept the shelter of a friendly lean-to beside the trail for several hours, and this with heavy packs and increased difficulties of travel delayed our arrival at the clubhouse on Spider Lake several hours beyond the time planned. Here we learned that another party had gone up Spider River where we had planned to go; but Jack, to use an expressive modern colloquialism, always has "something up his sleeve" for emergencies and to please and bring success to his employer.

To this seeming untoward yet fortunate circumstance is due my introduction to Deer Bog and the possession of two noble bucks weighing respectively 205 and 240 pounds.

Journeying from the clubhouse several miles by water and team we at length drew rein at the log cabin of an *habitant* near the edge of the woods. As he could speak no English, I was about to polish up my very limited knowledge of *parlez-vous Français* and start it going at him, when the very unusual sight of a winsome Canadian lass with auburn hair and hazel eyes appeared upon the scene and accosted us in English. I noticed that her cordiality was not that of a stranger, and that for Jack at least the place might be both dear and deer bog.

But Jack is married now, and this, as the novelist would say, is another story.

It was late in the afternoon and we had yet a couple of miles to travel on foot through the woods—some of the distance over an old portage road and some through swamp and dense undergrowth. The horse having been cared for, and telling her our errand, we took our departure for the adventures of the night at the bog, accompanied by her oft-repeated expression of good wishes for our success and safe return.

Arriving after a hurried walk, which induced profuse perspiration, at our destination in the rapidly deepening twilight, Jack sought his old dug-out canoe where it had been safely *cachéd* since the previous season, and dragging it over the yielding, mossy surface of the bog we launched it upon the water. A few yards back was what appeared to be a flag pole standing upright in the bog. Jack was somewhat puzzled and troubled about this, and in answer to my questioning said he thought that someone must have discovered this out-of-the-way and favorite place of his and had been camping here, and that the pole was probably erected for a flag staff.

We soon had two noble bucks, the limit allowed by law, "biled the kettle," improvised a shelter for the night, and slept the sleep of the tired and successful sportsman.

With earliest dawn, we started out for the team and assistance to bring out the game. Arriving at the cabin the daughter was surprised and delighted when told of our success, which, to appear gallant, we attributed very largely to her good wishes for our success the previous evening.

The parents were incredulous at first, but again being positively assured that we "got two bull deeres," and that the head of the household must lend a helping hand to get them out, he discharged a Maxim rapid-fire gun loaded with interrogatories at me, which the daughter as rapidly interpreted.

"My fader he wants to know if you gat dose deeres by fire?"

"By fire? Oh! yes, we jacked them," I replied when the meaning of her question dawned upon me.

This, being told to him, seemed to increase his surprise and led to animated and prolonged conversation between all the members of the household.

The interpreter resumed her task with:

"My fader he says you are big hunter for sure. He go on same place some tam, den some more tam, den more tam agin, and he hang him light on pole and stay all night and no deeres come. No, no—for sure."

"Did he have only one lantern, and did he whistle any?" I inquired.

"We haf only one lantern, but I don't know 'bout whistle him. I will ask my fader 'bout dat."

Then for a time the English abdicated and French had the floor.

"My fader say him no whistle. He say you know 'bout all dose things for get deeres, and will you tell him all 'bout fire way lak one big fire?"

"Well, you tell your father he must get another lantern and put up another pole opposite the one now there, and fasten a lantern high up on each pole. He must then get in his canoe and take his place midway between them, and whistle a jig or other lively dancing tune occasionally. You know deer are lively and jovial and have a good ear for music. Then when the deer come running down the mountain side and plunge into the water looking for the music, he can get a good shot. By having a lantern on either side he can see both ways, which will double his chances for getting his game."

This information elevated me in the estimation of all to a higher level as a mighty hunter, and elicited generous words of admiration, praise, and thanks.

Just then Jack announced that he had the team in readiness, and as our fire-hunting friend was to accompany him, I took my leave and pointed the toes of my moccasins toward Spider Lake, where Jack overtook me with the two bucks soon after I reached its shore. We loaded the deer in our canoe and a paddle of a few miles landed us at the clubhouse, where we were showered with heartiest congratulations and praise.

I have never heard whether or not our fire-hunting friend was successful in getting "deeres" by my improved method of jacking, and I have not deemed it judicious to make personal application to ascertain.

Geo. McAleer.

Worcester, Mass.

The Wolf Concert Cure.

Editor Forest and Stream:

There is, or was, away back in 1882, a silver mine just back of Cooks Peak, in Grant county, New Mexico; it is ten miles from the nearest railroad station, and what little ore there was shipped from this mine (it was only low grade ore, and a limited amount of it was sent up to Sante Fe to be used as flux in the smelter there) was hauled by wagon from the mine to Porter station on the Santa Fe road.

A friend of mine named Wilson had the contract to haul it, and he drove one of his teams himself. He had two fine horses in this team, but one of them was, I think, the most stubborn animal I have ever seen. A mule is credited with being stubborn. I could generally coax or whip an army mule into doing anything I wanted done. I could do nothing with this horse. I had tried coaxing him time and again, and had seen Wilson half kill him whipping him; I had to interfere to stop him; still the horse would not move an inch.

An Arizona camel that I once tried to educate, but made a failure of it, came about the nearest to this horse for stubbornness of any animal I have ever seen, one being about as stubborn as the other.

I carried a mail on this road, going over it twice a day, riding a mule, and generally each evening I would find Wilson and his team at a dead stop a mile or two from the railroad. This horse had quit here for the day. Then Wilson would unhitch them; then mounting this one or his other horse, would leave the wagon here and ride home. The horse would go now, but he would not drag that wagon another inch to-day. To-morrow he would help haul it down, then back to the mine; then down here again, to stop here as before. This was the regular programme; and Wilson was nearly tired of it, he told me.

I came down the road that evening and found the team here at a dead stop as usual. It had been here an hour now, and was still a mile and a half from the railroad; it would stay here if this horse had to haul it. I was a full hour ahead of train time, and concluded to try an experiment on the horse, if Wilson would let me.

"If you let me have this horse to-night, Wilson, I think I can cure him."

"Go ahead; cure or kill him, I don't care much which. I am sick of him."

We took his mate out of the wagon; then I got two rope lariats out of the wagon, and tying one on each side of his head, carried the ends of them clear across the road, one on each side of it; then drove the iron picket pins in hard, leaving the horse only a few inches to move his head in either way; and next we chained both hind wheels; that was hardly necessary, though, for the wagon had about two tons of ore on it, and the horse would hardly drag it far if his head were not tied if he did make up his mind to move. Next I unhooked his outside trace chain, tying it up out of his way. Then we both mounted and left him.

"I am afraid that the wolves will finish him," Wilson told me; "but I will risk it."

"They won't go near him as long as he is not crippled. I depend on those wolves to cure him. They will keep him in a cold sweat all night. That is why I left him there. I don't think you will ever have to leave him there, or anywhere else, after this."

These were the little prairie wolves; there were plenty of them here.

It was long after dark when I rode back here again on my way home. The horse heard me coming, and began to whinny; he was getting lonesome. These little wolves had already found him, and were giving him a free concert when I came up. I stopped a moment, and the horse began to dance; he would pull that wagon down home now, I had no doubt, if I wanted him to do it.

"You stay here," I told him; "we don't need you to-night; when we do we know where to find you."

I came back with my morning mail just after sunrise next morning; the horse stood just as I had left him, and looked at me as if to say, "What kind of a deal do you call this, anyhow? Have you never heard of the Humane Society?"

Wilson came up now, and taking the ropes off, hitched his other horse in; then mounted the seat, and the team started off. The horse needed no whipping to-day; he seemed to think that he could not get to that railroad soon enough. He wanted water and his supper and breakfast. He got them, then dragged the wagon up to the mine and back again, not offering to stop anywhere he was not told to stop, and getting in soon after 3 o'clock. He hauled six loads a week for the next month, then only quit because Wilson did, his contract being filled.

The next time I saw him, months after this, he was still going. I began to pet him, and asked, "How often does he go on a strike now?"

"Never. He has never offered to stop since the night you tied him out. I believe he remembers it as well as we do."

"Yes, and what is more, that horse understands every word we are saying now; I can tell by his eye that he does. Well," I said, standing in front of the horse and speaking slowly while I passed my hand down his face, "if he begins to stop again just send for me, I'll fix him. You don't want any more wolf concerts, do you?"

Cabia Blanco.

Ashbel's Goat.

We had been traveling up the St. Mary's River above the lakes and had just come out from the thick timber of the mountain side into the little marshy flat, where we sometimes camp. It was the middle of the afternoon. We had been traveling long and fast and the animals were all hungry. A halt was made here, and while each horse began to feed as rapidly as it could, most of the men slipped from their saddles, and ran back to tighten up the packs. A little further along on the trail were several boggy places, through which the horses must flounder with difficulty, and we did not wish to have the packs come off in a place where a saddle blanket would mire down.

Ashbel, however, who was an odd man—two men are needed to pack a horse—and who beside knew nothing about packing, sat on his horse, and with his glasses studied the stupendous cliffs of Citadel Mountain just across the river, which rise a couple of thousand feet almost sheer. Presently he exclaimed in an excited tone, "I see a bear."

"Grizzly or black?" said an older man who was near him, supposing that Ashbel had taken a stump for a bear, and disposed to make fun of the boy. But Ashbel was too busy to reply.

"By Jove, there's another," he said. "And there's another. There are three of them."

His good faith was so evident that the older men looked as he was looking, and after a moment each of them saw one or more of the bears, which were working about on the ledges and along the sides of a watercourse, running down the cliff, which was half precipice and half ravine.

The discovery of three bears was of course more or less exciting. Ashbel was the only one of the party who had formally started out to hunt. The other members of the party professed to be mere mountain climbers, yet one of them in his day had been a hunter, and had often been as much excited at the presence of game as anyone is likely to be. Still, the bears were a long way off; half a mile horizontally and nearly as much vertically. The whole outfit was in plain sight and they might take the alarm at any moment. It seemed useless to attempt to approach them, though it was obvious that Ashbel wanted to. Now was the time when Jack Monroe came forward with his usual cheerful optimism and declared that of course the bears could be killed.

He said, "We can crawl through the brush up to within three or four hundred yards of them, and they have a half a mile to run before they can get out of sight. It'll be queer if we can't get one of them before they disappear."

Ashbel needed no persuasion and the older man but little. Directions were given to let the horses feed for half an hour, by which time, according to Jack, at least one bear would have furnished a hide for Ashbel to take home. The three hunters crossed the river on horseback, and riding as close as possible to the foot of the talus of great rocks which lay beneath the cliff, began a long crawl through the tangled alders. For most of the distance the bears were in sight, or, at least, could have been seen by anyone who wished to look for them, but the hunters were all occupied in keeping out of sight themselves, and did not look at the bears again until they had reached an open spot below the cliff, which it was impossible to cross unseen. They stopped here perforce, and viewed the animals.

The mother was nearest to them; two cubs—yearlings apparently—were higher up, and all were busy searching for food. A few moments later, however, the old bear saw or smelt something that made her uneasy, and after looking across the valley at the horses, she started to scramble up the cliffs. The hunters must shoot now or not at all. The distance was estimated about 700 yards and bullets soon began to kick up the dust about the fleeing bears. One from Ashbel's rifle seemed to pass through one of the cubs, but the three kept on, and in a brief moment of time disappeared, evidently having reached a wide ledge along which they could gallop, unseen by the hunters at the foot of the cliff.

Returning toward the river they endeavored to learn from their companions on the other side what had become of the bears, but the distance was too great, and even the cheerful Jack became disgusted. Hearing his own shouts so distinctly, he imagined that those on the other side of the river must also hear them, and since he could not distinguish the words of the answering cry he declared indignantly that "those fellows seem to have their mouths full of mush."

When the horses had been mounted, the river crossed and camp reached again, it was getting late. Jack's twenty minutes had stretched out to nearly two hours, and it was decided to camp here. While the beasts were being unloaded, there was much speculation as to whether the bears had or had not been hit. Jack and one or two others thought they must have been, and finally Jack expressed a wish to climb up to where the game had been and to follow the trail. He asked Ashbel if he wished to go, and found that he did. The two at once started, but it

was two or three hours after dark before they reached camp again, hungry, tired and in rags. They had scrambled almost to the top of Citadel, had found where the bears had been, and had followed the trail where they had raced madly along a ledge, and then up a ravine into a basin back of the mountain, but the men had found no blood. Then starting back for camp they had been overtaken by night, and had clambered, fallen and rolled down the mountain side. They were tattered, wet, scratched and bruised, but still cheerful.

The next day I said to Jack, "That was a pretty tough climb you gave Ashbel last night."

"So it was," he said, "about as tough as I ever made."

"How did he stand it?" I asked.

"Oh, he's all right," said Jack. "He never squeaked or weakened. He'd fall down a place and roll along until the bushes stopped him and then get up and find his gun and come on again."

The next day we traveled on up the stream, reached the extreme head of the river and spent a few days there, hunting, traveling backward and forward over the mighty glaciers that furrow the mountain sides and climbing two or three peaks. Then turning our faces down the stream again, we reached the camp where the bears had been seen.

This is immediately below a stupendous shoulder of the main range which runs out from Mount Reynolds, one of its most impressive peaks. Reynolds had been in sight during much of our journeying up the river and it had appealed strongly to the imagination of one of the mountain climbers. He proposed that we should spend a day here and make a prospecting trip to see how close we could get to Reynolds. The suggestion was agreed to, for we all wished to reach the top of Hairy Cap from which it was believed that a large number of the kingdoms of the earth could be seen. Moreover there was a prospect that game might be found there.

Early next morning, five or six men might have been seen on hands and knees digging their fingers and toes into the almost vertical sides of Hairy Cap, and trying to reach its crest. A portion of the way chosen was bare of timber, and being covered with soap grass and dry vegetation was so slippery that it was with very great difficulty that it was climbed. At last, however, a clump of pine trees was reached on the shoulder of the mountain, and from here upward there was what seemed to be an old game trail, rough, rocky and sometimes steep, to be sure, but offering good footing. It held to the crest of the ridge, and occasionally extended views were had on either hand; on the right, the valley of the North St. Mary's, and on the left, that of the river we were camped on. At one point a bevy of great blue grouse was started from the ground, and all the birds flew into the pines and stood there looking down at us. It was not deemed wise to kill them on account of the possibility of big game being in the neighborhood, and when their curiosity was satisfied, one by one they whirled off into the valley, leaving the trees just as we sometimes see a wild ruffed grouse pitch from a tree in which he has taken refuge.

At last the summit of the ridge was reached and the walking was more or less level, though constantly ascending. It was a pretty country, with open pine timber and little lakes, and grassy meadows now partly covered with snow, furnishing an attractive feeding ground for deer or elk, or for sheep in winter. These animals must have been abundant here until killed off or frightened away by the prospectors, who in recent years have overrun the country on the lower river. Mounting steadily, but by a very gradual ascent, at last the pines grew smaller and fewer and a wide outlook was had over the country to the north. It was a great basin beginning at the foot of Mount Reynolds, nearly a mile wide, and sloping gradually down between Mt. Martin and Hairy Cap, toward the valley of the north fork of the St. Mary's, which, however, it did not seem to reach, but descending abruptly appeared to break off in a precipice a thousand feet high.

As we sat down near the edge of one of the cliffs to eat our lunch, the west wind blowing down from the heights above us felt cold. The basin into which we looked seemed from this great height to be level. It was intersected by many little streams, each of which had its source in some snowbank or ice field, and was dotted by many groups of pine trees, and looked like an ideal summer pasture for game. As we sat there, looking over it, the keen-eyed Ashbel exclaimed: "I see a goat. I see two goats." Sure enough; there they were on the other side of the basin, coming through a low saddle between a shoulder of Reynolds and Mt. Martin, working along slowly, feeding as they went, but a mile or more away and as safe as if gun powder had never been invented.

After watching them for a time, we went on, now quite above timber line and walking over finely broken rock, which in many places was covered with snow. And here was seen something more encouraging to the hunter; the track of a large goat, sometimes in the rocks, again in the snow; going in the direction which we were following, and made some time during the day.

While one man followed the track, the others spread out more or less on either side of him, so as to cover as much ground as possible. After perhaps half an hour of this search, all the time climbing higher, a cheerful whistle was heard, and looking up I saw, twenty-five or or thirty yards above me, Jack, who made signs that he had seen the goat. I hurried up to his altitude—signing meanwhile to the others of the party, all of whom scrambled toward the heights—and Jack showed me where the goat, but a moment before, had walked under a ledge out of sight. Presently we were all in position, and Ashbel, for whose success we were all anxious, stood with his rifle ready, waiting for the animal to appear. I wondered whether the sight of his first goat might give him buck fever and grasped a rifle in order to be ready to do anything that might be necessary. Jack shouted at the goat, and when it did not respond, threw down a stone or two and presently the majestic male walked slowly out from under the ledge and stood there, knee deep in the luxuriant grass. He made a pretty picture, his white body outlined against the green grass and the darker firs; and his sharp black horns, curving back toward his shoulders, shone in the afternoon sun as he slowly turned his face toward us. Ashbel was ready. The gun went to his shoulder. There was an instant's pause; the crack of the smokeless load, and the goat stumbled forward and slipped out of sight beneath the evergreens. It had been a good shot—instantly fatal.

While Ashbel and one of the men went down to skin the goat the others kept on along the crest of Hairy Cap toward Reynolds. It was far too late in the day to attempt to climb the peak, which still towered fifteen hundred or two thousand feet above us, and after a hasty inspection of its base, we set our faces toward camp.

Before we had reached the worse part of the descent darkness was upon us. How we fell down the mountain and tumbled over down timber and snagged ourselves on dead branches and generally had an unhappy time, I will not try to tell. It was near the middle of the night when we reached camp, and we were very weary and very hungry. But Ashbel had his goat. Yo.

Dawson Yesterday and To-day.

A thousand dollars in gold dust was stolen last night from the home of John McDonald, a tailor and dry goods dealer, while the family was at the theater. No arrests have been made.—Dawson news item.

ONE of the few suggestions of the untamed days of '97 and '98 is the gold dust still in circulation as money. This, too, will soon be a thing of the past, as the trading companies have put forth their fiat against the uncoined metal, and will only accept it at a considerable discount below its true value.

In other respects, the story of the tailor's thousand stolen while he saw the play might as well apply to the oldest as to the youngest civilized city in the world.

Things move at a rapid pace just now. How soon Dawson's past has been relegated to the legendary days!

It seems only yesterday that we heard that Foghorn George, the squaw man, with his Siwash brother-in-law, had washed the first Klondike gold. Civilization in four thousand years hardly made greater progress than Dawson accomplished in four. The man who travels to Dawson by steamer and palace car, laughs when you ask him if he saw any dead men on the trail. There isn't even a horse skeleton to be seen in White Pass, where three thousand horses perished in three months in 1897. Starvation has been switched off to the back country—to the headwaters of the Koyukuk and Kuskokwim, and a thousand unmapped streams that lace the Arctic waste. It is no longer a familiar spectre on the Klondike. Here the wilderness blossoms with potted geraniums and schoolmarms from New England, women of education, nurses, bookkeepers, and the like, have hard work finding employment, not because there is no employment for business women, but because the field has already been occupied. Dawson City now has fine municipal buildings, including a court house, a residence for the Governor, and a handsome new school house for the accommodation of upward of two hundred pupils. The Presbyterians have erected a modern church, after the style of the English country church, with a seating capacity for several hundred. Three of the churches of the city have pipe organs.

Dawson now has telegraph communication with the outside world, as well as telephones and a district messenger service, with electric call boxes. Its electric lighting system is thoroughly modern and up to date. The coal strike has not affected Dawson as it has three separate sources of supply above and below on the Yukon, independent of outside conditions.

There is not much indication of hardship about this paragraph clipped from a Dawson newspaper last fall: "Potatoes, which for a while were scarce, are again becoming plentiful. Fresh grapes, peaches, apples, watermelons and other such fruits are common in the market. The first shipment of potted flowers ever brought from the outside arrived from Seattle a few days ago, including blossoming geraniums and the like. They came in good condition, and sold well."

The boulders from the Thirty-Mile River have been removed, and the channel of the Upper Yukon greatly improved by draining and dredging. At Hell Gate, nine miles above Fort Selkirk, a dam 680 feet long has just been completed to concentrate the river in one channel and deepen it by the scouring that is bound to come with an increased head; and at Lake Le Barge jetties with sections measuring 400 feet, 2,800 feet, and 3,400 feet, respectively, have been constructed for like purpose. At Five Finger Rapids hundreds of tons of obstructing rock have been blasted away, and White Pass has no terrors now that the railroad has conquered its grades.

The questions bothering Dawson nowadays are much the same as elsewhere in civilization—elections, franchises and the like. As regards dissipation in its exuberant manifestation, Dawson long ago settled that. Gambling even has been tabooed, and Dawson is an ideal Sunday-school picnic ground to-day. The question is, Shall the Klondike Mines Railway be permitted to traverse the west side of First avenue to gain access to the wharves and quartz mills; and it can be stated for the benefit of New York city that the city government is not holding up the measure like their aldermanic prototypes in the wicked East.

Twelve millions in gold was Dawson's contribution from her creeks in 1902; but the city is also important in trade. For the three months ending Oct. 1, Dawson's customs receipts amounted to $227,144, and during September, she received and distributed goods to the value of a million and a third.

During the year 1902 Dawson has spent $60,000 improving the city streets. Many blocks of eight-foot sidewalks have been built, and extensive work has been done macadamizing streets and laying permanent sidewalks. Seventy thousand dollars was spent for the maintenance of the fire department.

The total assessed valuation of Dawson property, as shown by the report just compiled by the city assessor, is $12,038,740—not bad for the precocious six-year-old! J. B. BURNHAM.

Natural History.

Squids in Fresh Water.

A SHORT time since a newspaper story went about, telling of a citizen of Syracuse, who had captured, while drawing a net in Onondaga Lake, a strange looking fish. This, when submitted to a local teacher of science, was identified as a squid. Another specimen was afterward taken by another individual, and this last has come into the possession of Prof. John M. Clarke, who will submit it to an authority for examination in order to learn what it actually is.

The squids are marine animals, while Onondaga Lake is a body of fresh water, and it would be very astonishing to find squids actually living in that water; but on the other hand, a considerable number of cases are known where marine animals are found living in fresh water lakes, having in some way adapted themselves to new conditions, and appear to flourish under them.

Onondaga Lake, as is well known, is a shallow body of fresh water resting on strata which contain salt in abundance. From these strata it receives a certain amount of salt, for there are salt springs on the border of the lake which pour their briny waters into it. It is near such a spring that these squids are alleged to have been taken. Beside that, this body of water had not very long ago—in post glacial time—a connection with the sea by way of the St. Lawrence River, and at this time its waters may have been salt.

It is possible, of course, that these two specimens may have been introduced into the waters of the lake by some practical joker, though this seems hardly possible, since both are alleged to have been alive when taken.

Squids, or if not squids, at least members of the great Class Cephalopoda, to which the squids belong, have inhabited the earth since very early geological time, and to-day various forms of this class are known as the food of different fishes, as the famed nautilus, fossil as ammonites, and most impressive of all, as those giant squids whose arms may be 30 or 40 feet long, which have been described chiefly by Prof. A. E. Verrill, of New Haven, and which have given rise to so many stories of sea monsters and sea serpents.

One of the earliest descriptions of these vast creatures is that of Pontopidian. The animal was long regarded as a myth, although figured by the learned bishop, and described in the following language:

"This monster was taken at Dingle-I-cosh in the county of Kerry, being driven up by a great storm in the month of October last, 1673; having two heads, one great head (out of which spring a little head two foot, or a yard from the great head), with two great eyes, each as big as a pewter dish, the length of it being about nineteen foot, bigger in the body than any horse, of the shape represented by this figure, having upon the great head ten horns, some of six, some of eight or ten, one of eleven foot long, the biggest horns as big as a man's leg, the least as big as his wrist, which horns it threw from it on both sides; And to it again to defend itself having two of the ten horns plain, and smooth that were the middle and biggest horns, the other eight had one hundred Crowns a peece, placed by two and two on each of them, in all 800 crowns, each crown having teeth, that tore anything that touched them, by shutting together the sharp teeth, being like the wheels of a watch, the Crowns were as big as a man's thumb or something bigger, that a man might put his finger in the hollow part of them, and had in them something like a pearl or eye in the middle; over this Monster's back was a mantle of a bright Red Color, with a fringe round it, it hung down on both sides like a Carpet on a table, falling back on each side, and faced with white; the crowns and mantle were glorious to behold; This monster had but one bone about him, nor skin nor scales, or feet, but had a smooth skin like a man's belly. It swoom by the lappits of the mantle; The little head it could dart forth a yard from the great, and draw it in again at pleasure, being like a hawk's beak and having in the little head two tongues by which it is thought it received all its nourishment; when it was dead and opened the liver wayed 30 pounds. The man that took it came to Clonmel the 4th of this instant December, with two of the horns in a long box with the little head, and the figure of the fish drawn on a painted-cloth, which was the full proportion of it, and he went up to Dublin, with an intent to show it to the Lord Lieutenant."

The identification and further history of the squids from Onondaga Lake will be looked for with much interest.

Connecticut Winter Birds.

BEAVER BROOK FARM, MILFORD, Coon., Dec. 18.—*Editor Forest and Stream.* After an exceptionally cold ten days, during which the thermometer rarely reached the point of 10 deg. F., the weather became quite mild.

Yesterday, Dec. 17, I observed a large number of robins and blue birds and a few song sparrows and white throated sparrows, also a pair of common crossbills and some smaller finches which I could not identify. Again to-day I saw some of the above and in addition a sparrow hawk. Does this portend a mild and open winter?

M. G.

[All the birds mentioned commonly winter in southern Connecticut, except the crossbills; and these are such thorough vagrants that their presence does not necessarily mean anything more than bitter cold weather to the northward. We do not believe that the appearence of these birds portends anything meteorological.]

Teacher—"Bessie, name one bird that is now extinct." Little Bessie—"Dick!" Teacher—"Dick? What sort of a bird is that?" Little Bessie—"Our canary—the cat extincted him!"—Puck.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in Forest and Stream.

An Iowa Game Law Case.

The Waterloo, Iowa, Courier of Dec. 19 reports: The Supreme Court yesterday handed down a number of decisions. One of the most interesting was the case of the State against Harry E. Fields, of Cedar Falls. In this famous case, which was for the killing of six quails last winter in the closed season, Justice J. H. Hildebrand, of Waterloo township, before whom the first trial was held, found Fields guilty in spite of his claim, substantiated by the testimony of Prof. M. F. Arey of the Iowa State Normal School, that he killed the birds to mount as specimens for the museum at the State school. Fields appealed the case to the district court. The case was heard before Justice Hildebrand, Feb. 8, 1902, and before Judge Blair at the March term of the district court. In the district court, Justice Hildebrand's decision was reversed and Fields was cleared of any intention to violate the law. The State, while not able to further prosecute the defendant, carried the case to the Supreme Court. Now Judge McClain of that court rules against Judge Blair and in favor of Justice Hildebrand. One of the regretable features of the case is that Fields gets off without any punishment. Had he not been declared innocent by the district court he would have been obliged to have paid $20 fine for each bird killed, besides the costs. But there is this consolation, that a precedent has been established depriving any illegal hunter from setting up the claim that he is a taxidermist when birds are found in his possession which the law protects during certain seasons of the year.

The Register and Leader of this morning gives the following concerning Judge McClain's decision:

In the case of the State against Harry E. Fields, the Supreme Court decided yesterday that game birds can not be killed in the closed season for purposes of taxidermy or other scientific purposes. Fields was convicted before a Black Hawk County justice of killing quail in the closed season. He appealed to the district court, his defense being that he was a taxidermist engaged in collecting and mounting specimens for the State Normal School Museum. The district court found him not guilty. Section 2551 of the Code for the protection of game birds prescribes periods during which the killing of game birds is prohibited. No exception is made permitting them to be killed for any purpose, but section 2561, referring to certain harmless birds, other than game birds, prohibits the destruction of them or their eggs, except for the use of taxidermists. The Supreme Court rules, however, in an opinion by Judge McClain that the exception in section 2561 does not apply to section 2551.

License as a Remedy.

Editor Forest and Stream:

There appears to be two ends which may be attained by a law requiring license of sportsmen from outside the State of Maine. One is to restrict and retard the visits of many of these same sportsmen by adding a good sized license fee to their already heavy expenses and thereby help to free the woods of hunters. This will allow those persons who are mentioned in article under "Hunters' License" in Forest and Stream, of Dec. 6, to have the woods of Maine for their own use providing they pay the price.

This is rank selfishness and is intolerable to true men. The real object to be gained by a proposed license law is the better protection of the game now existing and the further propagation of any and all species of game which may be made to thrive in the forests of Maine.

To this end, the forests must be carefully watched and protected from fires. Rifles and guns should be prohibited by fishing and camping parties in the summer time, and finally the slaughter of game in close season, and most odious of all the butchery of deer by the score and hundreds by paid hunters hired by lumbermen to supply logging camps during the whole winter, should be stopped.

It is of no use to attempt to make little of this latter evil and point out that it is only in exceptional cases that it occurs. I have personally seen the evidence of it myself even in the small bit of the State which has come under my immediate notice, viz., heaps of rotting deer hides in close proximity to old lumber camps. In explanation of our question of what this means, we are told by our guides and by residents who live near these lumber camps, of as many as 60 or 80 deer being killed in a winter and consumed by the loggers who rarely have any other fresh meat furnished them. These are facts.

Now, why do not these guides or residents prosecute the law breakers? Because living as they do in the immediate neighborhood, a bullet or the burning of barn or house would be the result.

As I said before these are facts gathered in visits to Maine during the last ten years. Why should it not be so? Who is there to prevent it? The game commissioners of Maine and their assistants are doing a good work, all that a few men can do or be expected to do, and I believe the most effective work is being done in creating a public sentiment in the right direction, but there is need of a much greater number of executives in the prosecution of the game protection interests. What can one game warden do toward protecting the great territory which he is now expected to cover in the little time and with the little pay allotted to him. And just here is where the license fee or the fund derived therefrom, may be directly and profitably spent.

This is the outline of the proposition: The establishment by the game commissioners of Maine of a thoroughly organized, well equipped, intelligent and honest body of traveling game and forest wardens, who shall traverse during the entire year the wild region of the State, by twos for mutual protection and defense, and also for more efficient work. The State of Maine has an abundance of strong, courageous and capable men, so there need be no lack of material.

They would be really an organized forest police, not with settled beats so that lawbreakers might watch and know when to expect them, but rather with routes mapped out by their chief which might be known only by the head of the department. They would be expected to drop without warning upon loggers, trappers, hunters and fishermen's camps at all times of the year and make careful watch for evidence of law breaking which they could obtain for themselves.

Moreover, the same men should not travel the same country all the time, but by being shifted from one district to another, as with city police, would have no fear or favor in any particular locality. These wardens should have a yearly salary sufficient to attract and hold the best men. They should make reports of all their doings and experiences in the game country which would furnish a most valuable fund of information to the game commissioners of the State.

I have merely outlined above a few of the various duties which would fall upon such a band of men. They must also be numerous enough to efficiently cover the State. The number would depend somewhat upon the amount of fun available. It is reasonable to believe that seventy-five to one hundred thousand dollars would not be too little to expect from moderate licenses, say $5 for non-residents and half that amount for residents of the State. I do not believe that the latter should be overlooked in helping to pay for what conduces directly to their own interests. This amount would be directly in addition to the regular State appropriation along this line.

Above all, sportsmen should be shown that the license fee is not enough to prohibit or prevent any, but is to be used for one and only one object as outlined above, that is the direct protection of game and forests by men who are fully in the spirit of the work and give their entire time to the cause. I may say also in conclusion that I believe this is a plan which ought to be put into practice in every State where game is to be saved. Good laws are all right, but amount to nothing unless there are a sufficient number of men to directly enforce those laws, and sportsmen must pay the bills. Therefore I say, license the hunters.

L. A. J.

Rhode Island.

Massachusetts Association.

Two Important Meetings.

Boston, Dec. 20.—*Editor Forest and Stream:* On Thursday, Dec. 18, the Executive Committee of the Massachusetts Central Committee for Protection of Fish and Game, met at the Copley Square Hotel. The chairman, Mr. H. A. Estabrook, of Fitchburg, presided.

That the anti-sale law on partridges and woodcock should be continued was agreed by every one, and it was voted to endeavor to secure its enactment as a permanent statute the coming winter.

Mr. Wm. B. Phinney, of Lynn, who has been re-elected to the Legislature, and expects to serve again on the Fish and Game Committee, expressed the opinion that the law had been highly beneficial in preserving the birds, and should be re-enacted either permanently or for a term of years, and there is no doubt regarding the stand he will take; and he said he believed several of the members of that committee who have been returned would take the same view of the subject. But the attitude of the Executive Committee is one of determined effort in behalf of the measure, and Heman S. Fay, Esq., of Marlborough, was unanimously chosen as legal counsel.

Your readers will remember that he was counsel for the committee in 1899-1900, when the sportsmen fought and won the hardest battle in the history of game protection ever waged in this State.

While the Committee hope it will prove easier to get a renewal of the law, it is deemed the part of prudence to be prepared for a contest. Chairman Collins, of the Commission, was present, and is in hearty sympathy with us.

He expressed his disappointment that the Legislature last winter did not enact a law giving deputies the right of search, and it was voted that counsel draw up a bill of such a character as would be likely to receive the approval of the incoming Legislature and report the same to the Committee at its next meeting.

It was voted that an effort be made to secure a re-enactment of the deer law, so as to prohibit their killing for a period of five years more.

Mr. A. C. Sylvester, president of the North Attleboro Association, said hordes of hunters were in the woods of Bristol county from Dec. 1 to 15, and he condemned the present law for that county in severe terms. The impression prevails that sportsmen there have had enough of it. Let us hope so. Mr. Sylvester stated that the associations of the Blackstone Valley in Rhode Island will attempt to get a law against sale of woodcock and partridge in that State, which would be an advantage to sections of Massachusetts bordering on Rhode Island.

Capt. Collins also mentioned the difficulty met by wardens frequently in securing warrants for the arrest of offenders. It seems many of the judges are not deeply impressed with the importance of a rigid enforcement of the game laws. In one instance, where by the statute a fine of $10 is fixed, the judge made it $5. This raises the question whether or not judges are amenable to the law.

The Committee adjourned to meet at the State House on Monday, Dec. 29 at 2 P. M.

Association Meeting.

Immediately after the adjournment of the Executive Committee at 6:30, the members of the Association sat down to dinner. In the absence of President Reed, Vice-President Wm. S. Hinman occupied the chair.

Dr. E. W. Branigan, chairman of the Nominating Committee, presented the list of officers for 1903, to be balloted for at the annual meeting, Jan. 14. For President, J. R. Reed, Esq., is nominated, as are most of the present board. The following names were added to the membership list by unanimous vote: M. A. Spear, A. S. Bruinier, Hon. Wm. S. McNary, Leroy S. Brown, L. Noyes Whitcomb, president of the Englewood Club, all of Boston; Fred E. Gillis, of Boxford; Dr. Samuel H. Talbot, Cambridge; John C. Phillips, N. Beverly, O. K. Gerrish, Lakeville; B. M. Rockwood, Franklin. Mr. Charles C. Russell, president of Greenfield Sportsmen's Club, was elected a corresponding member.

Dr. J. T. Herrick opened the after-dinner speaking. He assured the members that the Springfield club, of which he is president, is active in securing the enforcement of the laws in that section, and that it is in hearty sympathy with the State Association. He reported that everywhere he went he heard the work of the Association commended in the highest terms.

President Sylvester said it gave him great pleasure to bring the greeting of the 300 members of the North Attleboro Association. He spoke in detail of the good work of that club in liberating quail and stocking the streams, as well as in educating the whole community to take an active interest in protecting and propagating fish and game and the enforcement of the laws. So much good has the anti-sale law done, not a man can be found in his section who is not in favor of its continuance.

Mr. A. B. F. Kinney expressed the opinion that not a man could be found in Worcester who would care to oppose the re-enactment of the law.

The testimony of all the speakers was that the law had been the means of adding materially to the number of birds in the covers.

Henry H. Kimball, Sec'y.

People and Incidents of Interest.

[By a Forest and Stream Staff Correspondent.]

On my arrival in Buffalo last Tuesday morning I found the mercury making love to zero, which made the big round stove in Le Valley's store a new friend of the warmest kind and one I regretted having to leave so soon, more especially so from the fact that that stove has been for many years the center piece of more game and fish history than falls to the lot of many of its kind. It is here that Major Phipps and his coterie of friends have weighed and measured game and fish from the Atlantic and the Pacific, from the waters and woods of Canada and Florida. Mr. Le Valley should write a history of men he has hunted and fished with around that dear old stove. Fish stories are not killing, on the contrary, they lighten the weight of years, the seared period of life loses its seriousness around such stoves. Mr. Le Valley himself is a fine exemplification of this, so let them flow, the fish gets heavier and makes a prettier fight with each telling.

It was here that I first heard of the laxity with which the game laws of New York State are enforced, a deplorable fact which reaches across most of the State. Buffalo, with its fine contingent of sportsmen, should wake up to the times' crying necessities, and enforce the game laws.

While in Rochester it was my good fortune to be entertained by Dr. Durand, of foot power boat fame. I found the Doctor full of his practicable, well-tested and clearly proven theories and delightfully entertaining on the subject; he only needs to meet you "face to face" and you are his. A visit to the Genesee Valley Club revealed much to the interest of visiting and local sportsmen. A beautifully mounted specimen of the tarpon surmounts an open fire-place, and other trophies are not lacking. A particularly interesting feature is a collection of Chinese firearms and field guns, captured during the recent yellow plague. It would take a page of Forest and Stream to do justice to this mixture of ancient and modern, aggressive and defensive thought; suffice it to say when one Chinaman exhausted his supply of ammunition he had to take to the woods.

A grilled chop and tea furnished reminiscent moods, and boyhood days came to us again and again, until I regret I can only continue in thought; however, there are deeds in men's lives of so rare and tender a sort that the world would be much better should they know of them and in a degree emulate them.

Imagine the blood-letting sportsman on his way home at 1 A. M., when the thermometer was below zero, hearing a wee small voice by a big tree in a lonesome neighborhood plaintively wailing "meaw, meauw." His big burly figure stops; he removes his warm gloves and feels around until he finds a half-grown kitten in the last stages of emaciation, gathers it up in the warm folds of his generous coat and carries it to his study, only to find it past his skill to help, except by kindness, warmth and then chloroform. With dimmed eyes he warmed it and it slept. I only remarked, "Doctor, didn't you prolong its agony? A dash on the frozen walk would have been quick and effective." "True," said the Doctor, "but I couldn't bear the thud."

In Syracuse I had the pleasure of meeting Mr. W. A. Able—most everybody knows Mr. Able, but those who don't ought to. In him I found the sportsman of a generation agone and of to-day, surely a happy condition only attained by the ordinary observances of God's laws to man. Mr. Able has a fine collection of forest and stream prerequisites of ours and other times, one of the most interesting is a gun with a romance.

This gun is a double-barreled flint-lock, with solid silver mountings, a rarely pretty, graceful affair, not weighing over seven pounds. It was made in the year 1810, in a basement at the corner now occupied by Von Lengerke & Detmold, on Broadway, New York, for a Frenchman who emigrated to this country for reasons best known to himself. He afterward settled on the shore of Cayuga Lake, and three years afterward died. During the many years (forty-seven) which his faithful widow survived him she had the servants remove this gun from its case and polish and oil it twice a year. Its beautiful state of preservation to-day would indicate that sentiment and affection so tenderly bestowed by her had lost none of its sacredness in the hands of others. This

identity of interest in cold steel between man and wife is food indeed for modern reflection.

Mr. Robert Hunter, of Fulton, N. Y., was most generous in giving me three hours of his crowded time showing me through their vast gun factory in this place, and knowing every detail of the work as he does, even to making of any of a gun's many parts, furnished me with much data that I never even dreamed of, yet I have handled guns so long that it tires memory to go back so far. Here I found 450 men employed and the factory running night and day, superintended by five brothers, all working in different directions that merge into one ambition, and that the highest perfection of their product.

At Utica Mr. Savage best showed his devotion to rifle building by forfeiting his lunch hour to entertain me. He informs me they will be in their new plant by Jan. 1, and Feb. 1 to 15 will be able to market their new products in the way of calibers, etc.

I visited Mr. H. H. Valentine in Albany and found him at this end of the State in much the same frame of mind as Mr. Le Valley at the other, regarding the game laws. The well known conditions of Rensselaer County, where, under closed season for three years, the grouse have nearly become extinct, tells the story—snared to death.

T. E. BATTEN.

NEW YORK, Dec. 15.

CHICAGO AND THE WEST.

The Death of Col Bobo.

CHICAGO, Ill., Dec. 19.—Last week there was printed in these columns some mention of that veteran bear hunter and prominent citizen of Mississippi, Col. R. E. Bobo. It is sad reading to offer in this time of cheer, yet I am obliged to chronicle the death of this friend, who was also the friend of thousands of other sportsmen in America. Col. Bobo died in this city at eight o'clock on Wednesday morning last, and his remains, in charge of his son and a friend, left this city yesterday morning for their final resting place in the soil of Mississippi. The immediate cause of death was an acute complication which resulted in something like severe jaundice, the liver being badly involved. Bobo was accustomed all his life to hunt in the malarial swamps of the cane brake country. Perhaps the swamps finally had their revenge on the man who had done so much toward conquering their secrets, and so much toward changing that country from a wilderness into a land of civilization. Col. Bobo lived to see fertile plantations stretching over much of his old bear hunting grounds, and he was one of the most prominent aids of the railroads, which have been doing so much toward settling the Mississippi Delta in the last few years. He died possessed of a fortune of $200,000 or $300,000, all of which he had amassed by his own energy and foresight. He was at one time offered $100 an acre for land for which he paid less than $2 an acre.

Col. Bobo was, without question, the most expert hunter of the black bear which this country ever knew. To repeat earlier mention of his exploits, I may state that he was known to kill 206 bear in one year, 6 one day, 5 the day following, and so on. It was his delight to take his friends out upon these hunts. There was no master of bear hounds in all the country like this same energetic Mississippian, as I am sure earlier mention in these columns must have shown fully.

It was my sad office to help Col. Bobo's friends to assemble his effects. I found in his pockets telegrams and letters bearing upon the recent presidential bear hunt in Mississippi, mention of which was recently made at his request in the FOREST AND STREAM. Sick as he was and nearing his end, as he personally knew before any of us did, it was none the less a source of great annoyance to him to have it reported in some of the Southern newspapers that he had shown discourtesy to President Roosevelt in refusing to join the latter with his pack of bear dogs. No one who knew Bobo doubts that he was the soul of courtesy and hospitality. As bearing upon this, a few months ago there was a little railroad wreck near Bobo's plantation, in which some 155 persons were left breakfastless on the train. They tramped over to Bobo's house and there they were fed, each and all of them. All of these people offered Bobo pay, but he stated that he had never charged a man for a meal in all his life, and was too old to begin it then. He practically kept open house in the old time Southern fashion, and he was one of the best living survivors of the old-time Southern type, generous, hospitable, ready to resent any wrong upon the instant, yet animated by a large sense of fairness and justice. There was not a negro on the Bobo plantation who did not love the "boss." I may say also, that, during his stay here, he made a wide circle of friends who not only respected but loved him, even on this short acquaintance.

He died at the age of 55 years. Mr. Fincher Bobo, his eldest son, is the sole remaining member of the family now at the old plantation.

There will be no one to take the place of Bobo, the bear hunter. The Delta is changing very rapidly. Railroads are going through there at distances of every few miles. New problems and new customs are arising in that country, the last of the old South to experience change. The Bobo bear pack will perhaps be scattered. The memory of its owner will not readily die, certainly not in the minds of those of us who have ridden with him, slept with him in camp, and known that friendship which arises only between men who know each other for what they are in the outdoor air, wide of all the artificialities and conventions of city life. I knew Bobo and loved him, and am only one of very many of whom the same might be said. I feel sure it is my privilege to speak for them in expressing this sense of loss. R. E. Bobo was no ordinary man. He was a big man and was rapidly forging ahead into still bigger stages of life. We cannot have too many American citizens of his type, men of courage, fearlessness and a fine and delicate sense of personal honor.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Deer in Massachusetts and Maine.

BOSTON, Dec. 21.—*Editor Forest and Stream:* The case of Mr. Collins, of Malden, has done more to advertise the deer law than anything that has occurred in Massachusetts for many a day. Hardly a daily paper for a week but has had something about it. Deputy Burney had him in court and he was fined one hundred dollars. Not having the money he was sent to jail where he remained some days. It was believed, however, that he was ignorant of the law. He had a numerous family dependent upon him, so the kind-hearted judge, Judge Pettengill, started a subscription to pay his fine. The generous citizens of Malden and others responded and the poor fellow is now at liberty. Now probably this man was not unable to read, and it seems very strange that he should not have known that the killing of deer is illegal. Query, how can a knowledge of the game laws be made universal?

The total of deer shipped through Bangor this year is 5,289; of moose, 191.

It is believed that fully five times this number of deer have been killed in the State the past season. Even this estimate may be too low. No doubt there are a great many still left in the woods, but what would be the result of a very severe winter on the supply for coming years?

It is reported that excellent sport in the shooting of bears and foxes has been had in Washington County and southern Aroostook. Some of the Boston sportsmen recently returned with deer are: Messrs. J. H. Harding, S. J. Turner, W. H. and Mrs. W. H. Ellsmere, John Magee, F. F. Field, A. B. Pratt, O. E. Bowers, H. A. Lewis, John J. Moore and Harry B. Hobbs.

Dr. A. F. Townsend, a dentist of Worcester, brought out two fine deer. He also obtained with his camera many of the best views of scenery about Katahdin.

CENTRAL.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The Sea Trout Per Se.

Editor Forest and Stream:

In No. 3 of Mr. Venning's series of interesting sketches which are being printed in FOREST AND STREAM under the caption of "Reminiscences of an Octogenarian," the author discusses the much vexed question whether the sea trout (so recognized by naturalists thirty-five years ago) and the brook trout, yclept *Salvelinus fontinalis,* are identically the same, or a different variety; and he courteously challenges me by name to meet his objections to my contrary opinion, which I am known to have pertinaciously defended for a lifetime.

Well, under a position so well fortified and strenuously defended as his, I should say that my inevitable alternative would be to recant or burn, except that I happen to have, as I believe, the key to the problem, which, if admitted, should reconcile all variances. We will see!

While both of us agree that there is no specific or structural difference between the two fishes, I maintain that their environments, habits and food are so widely diverse that they predicate variety, distinct and obvious, just as parents differentiate and distinguish twins which cannot otherwise be told apart. I hold that the sea trout is a littoral marine fish, which feeds (for the most part) along the estuaries on shore food, and spawns in the rivers at the head of the tide, or not far above it, while the brook trout dwells in the forest, feeding on insects and ephemera (for the most part), and spawns all along the length of a stream from its mouth to headwaters. One is migratory and gregarious, entering the rivers periodically in immense numbers, in June and October, after the salmon; not to deposit their spawn, but to eat the extruded ova which the salmon have deposited in the gravel, while the other is a purely local, stationary and fluviatile fish, which is never found in very large schools and never leaves his native water except in individual cases for a momentary picnic in the brine, supposing that he has access to it. The largest schools of brook trout that I have ever seen were in artificial retaining ponds.

As to geographical distribution, brook trout occupy the greater part of the inland continental area of British North America and the United States, being found in twenty-eight States, while sea trout are not met with below latitude 49 degrees on either the Atlantic or Pacific side, and then only in coastwise estuaries and in rivers having access to the sea.

Taxonomically, fishes may be classified as follows:

1. Pelagic fishes, which are ocean rovers, though many species, such as bluefish, tilefish, menhaden, mackerel and herring, come inshore to feed at certain seasons, and some of them perhaps to spawn.

2. Littoral or shore fish, which dwell and feed along the coast, but run up at times into the rivers and estuaries to feed and spawn, usually at or near tide water, where the flux and efflux nourishes the ova with alternate baths of salt and fresh water every day. Of this class are white perch, skates, sheepshead, some kinds of sharks, sea sturgeon, hyacks or gaspereau, dogfish and sea trout.

3. Anadromous fishes, which spawn and mature in the rivers, but take their salt and fresh water baths at long intervals, returning periodically to their native gravel beds. Of these the shad and the so-called sea salmon, in contradistinction from landlocked salmon, are conspicuous.

4. Fluviatile fishes, which spawn and live continuously in fresh-running water, though individuals at times run down to salt water if they have access to it. Black bass, pike (jack fish), and brook trout are notable examples of this class.

5. In the great inland lakes the lacustrine fishes imitate the ocean fishes to a degree; the ciscowits, namaycush, herrings, whitefish and sturgeon ranging wide, for the most part, but approaching the inflowing rivers at stated seasons in quest of minnows, shadflies, shrimps, and microscopic bottom food, or to spawn on the sandbars at and near the outlets. In lesser eastern lakes, the like habit is noticed, where landlocked salmon and togue follow the smelts into the rivers in early spring, though they do not themselves spawn until October. (No more do the sea trout, although they run up the rivers in July.) So also in the British northwest the trout and sturgeon of the great lakes spawn near the discharge, while grayling, trout and squawfish spawn all the way up to headwaters of the affluents, thereby providently stocking the water courses throughout their fluvial extent.

This general information I have acquired chiefly by travel and observation, though Mr. Venning, who has not been thoroughly posted on my continuous field work, is pleased to intimate that I foregather mainly by hearsay. Such, I plead, has not been my life-long reputation. But give hearsay a chance! I will not affect to stand on my own ipse dixit. In canonical jurisprudence "the tesimony of two witnesses is true," and I have two accredited witnesses! One of these is Com. J. U. Gregory, of the Canadian Department of Marine and Fisheries, who has been at the head of the lighthouse supply for thirty-eight years, and has cruised along shore some. The other is John Manuel, of Ottawa, who owns the river Godbout, on the lower St. Lawrence, and has hardly missed a salmon fishing season for twenty-five years, to my personal knowledge. I have been bon camarade with both these gentlemen more or less since the 60s. Mr. Gregory writes:

"I am of opinion that sea trout are gregarious and migratory shore fish, which come and go periodically, feeding on littoral food, such as minnows, caplin, sand worms, shrimps, etc., as you say, and are looked for only at stated periods of the year; but I am aware that many rivers, at certain periods yearly, become well stocked with sea trout, which come in by the mouth of the river which empties into salt water; that these fish go a long distance up-stream, and are a nuisance in salmon pools. After a time, they disappear; while in these same rivers, the ordinary *Salmo fontinalis* remain on, and are about as numerous as they were before the sea trout struck in and went out again; therefore, they do not follow them to sea. I consider this as an argument in favor of your theory."

But Mr. Manuel's deposition is a clincher. He says, cautiously:

"As to where sea trout spawn, I cannot declare at present. My observations on the Godbout are that they go up that river in large numbers; but I think it is for the purpose of reaching the spawning beds of the salmon and living on the ovum. My reason for thinking so is that they follow the salmon. When we see the trout going up the river, it is a sure sign that the bulk of the salmon are already up. Another reason is that I have never seen any trout fry in the river. If they spawn in the river we would surely see the young trout, just as we see the salmon, peel and parr, unless they all got out to sea before we reach the river, which is early in June. In that case they would be differently constituted from the salmon, for the young salmon cannot live in salt water until they are two years old, and have got the silvery scales like the parent fish. But even if they did go out, as stated, there would always be some late stragglers to be seen to show that trout had spawned in the river. I have seen them netted in large numbers at the mouth of the Godbout River. We net them every year, to prevent them getting up to the spawning beds of the salmon. We don't market them, but give them to the habitants for food, our only object being to get rid of them and protect the salmon as much as possible. The large schools of trout that appear in the estuaries in July and August are going up. Some of them may come down again later in the season, but most of them remain in the river all winter and come down when the river breaks up, in May. I incline to think that sea trout are littoral or shore fish, as you suggest."

From the foregoing evidence it seems to me that Mr. Venning's observations can easily be reconciled to fit, if he would but allow that sea trout ascend rivers to eat spawn, and not to deposit it. We all know that the sea trout of Alaska are voracious spawn eaters, and that the Indians of the Pacific coast use little else than fish spawn for bait. The Dominion Coast Survey has reported sea trout all along the eastern and northern Labrador coast as far as Hudson Bay; but these fish do not occur in the Mackenzie River, nor do any kind of salmonoids, and Lieut. Fred. Schwatka does not mention sea trout as occurring in Back's or Great Fish River, although he speaks of salmon fishing in July and August, and of catching them through the ice in winter. Had sea trout been present, some of them would have been hooked.

I would suggest to the guild that comparison of the gills of fresh run sea trout when in the rivers with the gills of occupants which are known to remain the whole year round, would show quite a difference in the texture and color of their papillæ. Nature has adapted every creature to its environment, and no one can thrive equally well in two elements, even amphibians. Introduced species have to be acclimated. The difference of density of salt and fresh water is well known, and besides, the two are chemically quite unlike.

CHARLES HALLOCK.

FAYETTEVILLE, N. C.

A Marine Station for Florida.

Hon. S. M. Sparkman, of Florida, has a bill before Congress authorizing, empowerings and directing the Commissioner of Fish and Fisheries to establish in the State of Florida, on the Gulf of Mexico, a station for the investigation of problems connected with the marine fishery interests of the region. It reads:

Be it enacted by the Senate and House of Representatives of the United States of American in Congress assembled, That the Commissioner of Fish and Fisheries be, and he is hereby, authorized, empowered, and directed to establish at some suitable point in the State of Florida, on the Gulf of Mexico, a station for the investigation of problems connected with the marine fishery interests of the region.

Sec. 2. That for necessary surveys, purchase of land, erection of buildings and other structures, and for the proper equipment of said station the sum of twenty-five thousand dollars, or as much thereof as may be necessary, be, and the same is hereby, appropriated, out of any money in the Treasury not otherwise appropriated.

The House Committee on Marine and Fisheries has made a favorable report on the measure, on which they say:

"The Committee on the Merchant Marine and Fisheries, to whom was referred the bill (H. R. 11476) authorizing, empowering and directing the Commissioner of Fish and Fisheries to establish in the State of Florida, on the Gulf of Mexico, a station for the investigation of problems connected with the marine fishery interests of the region, have examined the same and recommend that the bill pass without amendment.

"There have heretofore been established two of these similar stations for experimental work connected with fish problems on the Atlantic coast, one at Woods Hole, Mass., and the other at Beaufort, on the coast of North Carolina.

"It is considered by the Fish Commission that the above two stations are sufficient to cover necessary investigations on the Atlantic coast.

"The species of fish found in the Gulf of Mexico, their habits and manner of propagation, are essentially different from those found upon the Atlantic coast, and an independent station for such investigation is absolutely essential if the same objects are to be subserved for that region.

"The necessity for such biological investigations for the propagation of fish has now been settled beyond controversy, and this work must necessarily proceed or be contemporaneous with the establishment of fish-cultural stations.

The catch of shad on the Atlantic coast prior to the introduction of artificial propagation had been yearly decreasing. Under the influence of artificial propagation by the Fish Commission the catch has been increased from 3,000,000 fish in 1880 to 11,760,000 in 1898, this increase being equal to 30,000,000 pounds of fish caught in 1898 over the catch of 1880—valued at nearly $1,000,000. At a cost of not exceeding $4,000 shad were introduced on the Pacific coast, and 5,000,000 pounds of this fish have been recently caught where there were none before. By artificial propagation we are increasing the supply of food, and thereby cheapening it, to the great benefit of the people.

"A similar work is being done for the salmon industry on the Pacific coast, where the catch has been greatly and continuously increased since artificial propagation was introduced, and the salmon is also being successfully introduced into the Great Lakes.

"An equally important work has been in progress in connection with the cod fisheries of the Atlantic coast from Maine to New Jersey. In this region, under the influence of artificial propagation, the catch of cod in 1898 showed an increase of 43,000,000 pounds in ten years; and as another result of the Fish Commission's work, extensive inshore cod fisheries have been developed there during the past few years, where few or no fish were found before.

"The artificial propagation of the shad, cod and salmon was necessarily preceded by a large amount of biologic work, which made known the principal facts connected with the reproduction and breeding habits of these fishes; and so in connection with the artificial propagation and increase of the other species of fish and of the oyster, clam, lobster, shrimp, etc., here again the practical work of propagation must be preceded by a still larger amount of experimental work, in order that we may know more accurately the processes of reproduction; and there is need also of a much larger amount of information concerning the nature and extent of the food and feeding and breeding grounds of these different species of fish and other forms.

"The Fish Commission is one of the most useful departments of the Government. The result of its work is to increase the supply and thereby cheapen one of the most important food products of the country. Improved transportation facilities are year by year distributing this food product to consumers everywhere. The only cost of this food consists in propagating and starting the young fish, catching them when grown, and distributing them. Nature does the rest. This work of propagation cannot be done by individuals or States. It is essentially national in character and must be done by the Government. If this beneficent work should cease this great food supply will ultimately disappear. Enlarge it and the supply will be perpetuated, increased, and cheapened.

"As heretofore stated, careful and painstaking investigation is necessary and precedent to the more practical work of propagation by the hatchery stations.

"The Fish Commission have made a careful investigation of the territory covered by the Gulf of Mexico with a view to selecting that location which would offer greater facilities for the investigation of the sea life peculiar to the Gulf of Mexico and have concluded that the same should be established at some point upon the west coast of Florida to be subsequently determined by the Commissioner of Fish and Fisheries.

"The operations of this station will require no large annual expenditure, as the investigations will be conducted by volunteer observers and scientists from the country at large and by men already in the employ of the Fish Commission.

"The committee appended hereto a communication from the Commissioner of Fish and Fisheries recommending the passage of this bill.

"'Commission of Fish and Fisheries, Washington, D. C., April 29, 1902.—Sir: With regard to the bill (H. R. 2000) to authorize the establishment of a fish-cultural and biological station on the Gulf of Mexico within the limits of the State of Florida, it is recommended that it be not passed, as it contains several objectionable features, to which attention has been drawn in previous communications. In place of this bill, I recommend the passage of House bill 11476, which provides for the same station. Very respectfully, Geo. M. Bowers,

"Hon. Charles H. Grosvenor, Chairman Committee on the Merchant Marine and Fisheries, House of Representatives.'"

Work of the New York Hatcheries.

Fishermen will be particularly interested in that portion of the forthcoming report of the Forest, Fish and Game Commission to the Legislature which deals with the State Hatcheries. This important part of the work is in charge of Hon. Chas. H. Babcock, of Rochester, who is himself an enthusiastic fisherman, and who ever since his appointment as a member of the Commission has taken entire charge of the supervision of the hatcheries and the distribution of their output. The State has eight regular and four temporary hatcheries from which to stock the lakes and streams with every desirable variety of fish. Their product this year amounted to 128,672,516 fish of the various varieties, and their facilities have been so increased as to provide for a much larger output of yearlings and fingerlings than usual. This form of distribution will in the main hereafter take the place of fry, as the fish are much sooner available to the people, and numerous reports received from various parts of the State indicate that the departure made is giving the greatest satisfaction. The distribution for the year included an unsually large number of lake trout yearlings, as well as of the other varieties of favorite game fish. Particular attention was also given to increasing the output of cheap food fish, and the figures of the report show that large amounts of pike, perch and whitefish have been placed in the waters of the State. It is the intention of the Commission, if suitable provision is made by the Legislature, to return to the cultivation of black bass, for which there is a large demand, and for which also one of the State hatcheries is admirably suited. During the past year 10,000 of these fish were netted out of the canal and distributed in nearby ponds and streams in accordance with the custom of the Commission, which is to save as far as possible the bass when the water is drawn off from the canal. No help has been required from the United States Fish Commission during the year, as the excellent condition of the State Hatcheries enabled them to meet all requirements. The number of applications received by the Commission from all parts of the State for fish of various sorts was about 1,700.

Pike-Perch Planting in Northern Vermont.

It is gratifying to learn that the hatching and distributing of pike-perch (glass-eyed pike, wall-eyed pike) in northern Vermont has been attended with very encouraging results. The fish were hatched at the Swanton Hatchery on the Missisquoi River, and were distributed in various ponds and streams in that section of the State as well as elsewhere. The work was begun by the U. S. Fish Commission in 1899 as an experiment, and has since been carried on jointly by the U. S. Fish Commission and the State of Vermont. The partly grown and adult fish were caught in great numbers this last summer in Franklin Pond (Silver Lake) and other lakes where they were never known to exist before. In Silver Lake, the pike-perch fishing is reported to be as good as in Lake Champlain, and in Lake Champlain itself, pike-perch are said to have appeared in unprecedented numbers.

It is quite possible that the U. S. Fish Commission will establish an extensive hatching plant near the mouth of the Missisquoi River for the hatching of these fish. Mr. Myron Green, formerly superintendent of the U. S. Rainbow Trout Station in California, has been appointed Superintendent of the Vermont State Hatchery at Swanton where the pike-perch hatching was conducted, last year.

Salmo.

Remarkable Growth of Trout.

Kalamazoo, Mich.—*Editor Forest and Stream:* In response to Dr. Bean's request in your issue of Dec. 13, I send you these notes of trout growth.

About June 15, 1902, I placed 94 trout in a fountain of our City Park. Of these 78 were rainbow trout hatched Feb. 15, 1901, and 16 were brook trout hatched about the same time. The rainbow trout averaged about 10 inches and the brook trout about 7. The fountain basin is circular, 60 feet across, having a depth of water of 4 feet. The water supply was taken from the city mains and was not very large, consisting of a center spray and four or five smaller jets.

Here these fish found an acceptable home. Everybody fed them worms, minnows, liver, Hamburger steak, cake and crackers, in fact, almost everything. The remarkable part of it was that the rainbow trout ate everything that was offered them. They were very tame and everything was grist that came to their mill. The brook trout were not much in evidence, there being a pyramid of cobble stone in the fountain in which they could hide.

Six fish were lost during the summer. On Oct. 23 I took the fish out and they were simply enormous. The rainbow trout weighed 1½ pounds; four of them weighed 2 pounds. The brook trout averaged about ¾ pound. They were very highly colored, in fact, could not be distinguished from wild fish. I attribute their large growth to the amount of rains they had and the diversified food. Also to the temperature of the water which was quite high.

Albert Rosenberg.

Reminiscences of an Octogenarian.

Part IV.

BY THE OLD ANGLER.

(*Continued from page 494.*)

Before leaving the subject it may interest the Old Guard to know that the first time the writer met dear old Thad Norris was at Rough Waters on the Nepissiguit, where, on a former visit, he had killed his first salmon. The manner in which he handled a lively fish, fresh from the sea, on a rod of his own make and on a fly of his own dressing, settled his standing as an expert angler. His main object in this second visit to the North Shore was to inquire thoroughly into this vexed question of a sea trout in North America, distinct from *fontinalis*, for the prevalence of which belief he was himself largely responsible. In his "American Anglers' Book," published some years previously, depending almost entirely on erroneous information and a few hours' fishing on the Tabusintac, an affluent of the Miramichi, he described the fish caught there as the *Salmo Canadensis* of Hamilton Smith. He stated that it was entirely distinct from *S. fontinalis*, and a purely anadromous species. He had afterward found reason to doubt the correctness of his published opinion, and hence this visit for a more thorough examination of the grounds on which it was based. He had just come from the Restigouche, where his inquiries left him in grave doubt of the existence of such a fish in that river. The late Samuel Wilmot, Superintendent of Fish Culture, was one of the party, and we discussed the question fully and freely. He was introduced to the intelligent fishery Overseer of the district, and by him brought in contact with the oldest fishermen on the river and down the coast.

During our stay at Rough Waters an incident occurred which furnished much amusement and some instruction for the whole party. Among the canoe-men was Billy Bateman, one of the best on the river. His home was not far from our camp, and his father, a man of middle age, came often to visit us. He was a most amusing character, full of cynical remarks and quaint expressions, whose horse-sense and mother-wit made him always a welcome visitor. He was a special favorite with Mr. Norris, who was highly amused at his droll sayings and caustic remarks about the waste of time spent in angling. He averred that he could take more fish in a single night on his hickory hackle (*Anglice*—spear) than the whole party could in a week with all their "costive rods and silkworm's guts." He said if a salmon knew his own strength he could break the strongest leader that could be made. Billy, who was a good rod fisherman as well as a most expert spearer, had all his father's quaintness and a stronger sense of humor, spoke up at once:

"Well, father, you're a good deal stronger than a salmon; do you think you could break loose if you were in the water and the fly was in the collar of your shirt?"

"Of course I could, and smash your rod, too!"

"Well, father, I get a dollar a day for poling this canoe a good many hours. Would you like to make it in ten minutes?"

"Just give me the chance, my bouchal (*Anglice*—good boy)."

"Very well; hold here."

Taking my Castle Connel—the strongest rod in the party—a fly was securely fixed in the collar of his strong woollen shirt. Near by was a deep pool close inshore, where salmon never lay. It was about 25 yards across, but to get out of it, a steep rugged ledge of rocks had to be climbed before footing could be obtained.

"Now, father, you go in, swim across, get on the rocks and you can run out the whole line and break the leader or the rod."

"Put the dollar in Jack Buchet's hand and I'll show you a trick the salmon don't know."

Wilmot supplied the dollar for Billy, and old man Bateman, dressed only in homespun shirt and trousers, slipped into the pool and struck out for the other side. Billy retreated and let the line run off the reel. When he had about 20 yards out and the old man had some 10 yards' start, and was swimming strongly, Billy put the whole force of a wide arch on the line, which checked the swimmer's progress. Still he make headway slowly, and various were the opinions expressed and great the excitement produced. Norris cheered and encouraged the old man; Wilmot and Hickson prompted Billy. I had little doubt of the result, but still was nervous about my rod and line—the leader was a small affair. For some moments it was doubtful whether the old man would get across; but slowly he forged ahead, and Billy had more line out than he cared to see. Of course, he could not reel in, and had to let the line run or risk the leader. The arch was wide and the strain so even that there was little fear for the rod. I doubt if one of that party was ever so much interested in seeing a salmon played, as he was in this novel trial of strength between a man in the water and a single gut leader in the hands of one who knew how to use a rod. At length the old man reached the ledge and lifted an arm to secure a hold. At that instant Billy "gave him the butt" for all the rod could do, and as he expected, the old man lost ground. Again he reached for a hold, and putting out all his strength, raised his shoulders from the water. Another application of the butt, pointed straight at him, pulled the old man backward, and he went completely under water. Again he attempted to gain a hold and again he was drawn backward, heels over head, into the water.

"Will you give in, father?" called out the graceless scamp, while shouts of laughter shook all the spectators of this queer scene. The old man was really too nearly exhausted to make further efforts, and Buchet, who had been sent round by Billy after the first submersion, reached down and assisted him up the ledge. I attached the fly to the hook of a spring balance, and holding it firmly by the ring, directed Billy to put the same strain on the line in order to ascertain how many pounds of tension the old man had contended against in the last ten yards of his struggle. The index marked ——. Perhaps no question in the wide and varied range of those offered by angling has given rise to more discussion than that of how much force, in pounds, a salmon exerts in its rushes. The wildest answers have been given, showing how various are the conclusions reached from the same data. Some

good anglers have estimated it at not less than 40 pounds. Others have fancifully thought a pound of strain for every pound of its own weight would be a near approximation, while others have contended that no salmon ever hooked could move a ten-pound weight lying on the ground. The note-book in which is recorded the number of pounds indicated by the balance, is now before the writer, and he would like to have his angling readers guess the number.* The old man soon recovered after clearing his stomach of the water taken in his tumbles. He was quite crestfallen, and revised his opinions about rods, lines and salmon. Mr. Norris suggested that the fun and information derived at his expense was well worth a dollar to each, with which we all agreed, and the old man said "devil so good a day's work did I ever do in my life."

Mr. Norris did his work thoroughly this time. After leaving the river he proceeded down the coast to interview fishermen whose fathers were among the first settlers, and who had fished all their lives. As the writer's official duties required his presence at Chatham, whither he intended proceeding by rail, he changed his mind and decided to accompany Mr. Norris down the coast, and with him visit the Tabusintac which debouches into the estuary of the Miramichi. This is a very considerable stream, which in its upper waters divides into two branches, each of which has several smaller tributaries. It has, since the settlement of the country, been celebrated for the number and size of its trout, and as the post road to Chatham crosses it not far from its best pools, a fine opportunity was offered, with little trouble or expense, for Mr. N. to see on this visit the true habitat of the sea trout, and to correct his former opinion that their habitat was the sea. As this river offered every facility for testing the statements made by fishermen and arriving at a sound conclusion, we made but one stop in the journey, at Caraquet, in order that he might taste the oysters which more nearly resemble the English "natives" than any others in the Maritime Provinces.

Here we met Overseer Hickson, one of the most intelligent and energetic fishing officers that ever gave good service to his country. He had gone down the coast on one of his periodical visits to inspect nets and settle some of the numerous and interminable disputes that constantly arise among fishermen, especially when the disputants are French. We put up at a comfortable farm-house where Hickson was to hold his court. He sent the local warden to rake a basket of oysters, which added much to the enjoyment of a substantial dinner for which our ride in the ozone-laden breeze from the salt water had given us a sharp appetite. After dinner Hickson, who knew the disputants and their several dispositions, prepared the wide hall for his court-room, and covered a large table with all the books in the house. The neighbors, mostly French, from far and near, had made a fete-day, and were waiting outside in quite a crowd, and of course did not fail to sing *En roulant ma boule.* Arranging his papers, and taking his seat in a large arm chair, Hickson summoned the disputants, announced the court open, and made a speech in substance as follows: "Gentlemen, before I hear this case, I wish to say that these disputes are growing more frequent and more annoying to the neighborhood, to yourselves and to me, every season. I have made up my mind that these quarrels about nothing must end. Hitherto I have refrained from applying the law, which fully provides for all these cases, solely for the purpose of saving you expense and large legal costs. Instead of appreciating my leniency, you have redoubled my labor, and caused me great annoyance, to which I will no longer submit. I am here to-day to uphold the majesty of the law. Do you see these books? They are all full of law, and I will enforce the whole of it if you make it necessary. There are many knotty points of law in these books and every knot will cost you each five dollars before it is satisfactorily decided. I advise you to settle your disputes without any law proceedings, and to give you every chance to do this, I now adjourn the court for one week, when it will re-open at my house in Bathurst at ten o'clock in the forenoon. *Vive la Reine!*" The result showed that Hickson fully understood his men. He heard no more of the case and his little ruse saved the fishermen and himself from much trouble. Hickson has now reached the allotted span of life, and has retired from the arduous duties his office imposed. In his early manhood and middle age few could compete with him in feats of strength and agility. He was, until years impaired his strength, a good hunter, an able canoe-man, a fine shot with rifle and pistol, a neat fly-dresser, a good rod-maker and a thorough angler. Like the water, he can now only live over again in memory, the pleasant days spent in pursuit of fin, fur and feather, and these memories recall to each of us many happy hours in forest and on stream. All old-time anglers on the Nepissiguit will recall Overseer Hickson's uniform kindness and assistance in their search for sport. He is the last of the Old Guard left on the North Shore.

We arrived at Tabusintac that night and next morning proceeded up stream to the famous Escadillac pools, which, on his former visit, Mr. N. had reached by going down stream from Harris's Inn on the Bathurst road. Here, as Mr. N. had done before, we caught trout at almost every cast weighing from one to two and a half pounds, and desisted only when surfeited with fishing. As the smelts had long left the river, these trout, if denizens of the sea, should have followed them; but here they were, veritable *fontinalis,* identical with those which are found in every river in the Maritime Provinces, and here they would remain until they went down to salt water to meet the smelt again the following spring. The result of this inquiry on the mind of Mr. Norris was that the North Shore of New Brunswick has no sea trout distinct from *fontinalis.* The lamented death of Mr. Norris soon after prevented the publication of the conclusion arrived at and the grounds for correcting his former belief. We parted at Chatham. Mr. N. took rail for St. John and his home in Philadelphia. Alas! the next tidings of my friend announced his unexpected death, and as I grieved, so, I am sure, did every angler and every man who had enjoyed the intimacy of this genial gentleman and true sportsman—one of the best known of the Old Guard. Mr. Norris was the pioneer writer on Fish Culture, and though printed 35 years ago, his book contains all that so-called *scientists,* with half the alphabet attached to their names, have since written. His "Anglers' Book," I hope, is in the hands of every American fisherman.

In taking final leave of this subject, the Octogenarian would like to expostulate with *Messieurs les Savants,* who have lately developed a genius for new classifications. There seem to be fashions in zoology as well as in dress. Some years ago the fashion was to generalize structure and to reduce species; to-day the fashion is to differentiate very minutely on structure and to multiply species; but in neither fashion is there unanimity among the savants. Since the days of Dame Berners, Father Izaak and Brother Cotton, the anglers of England, Ireland and Scotland have been under no doubt or difficulty about the brook trout. On the continent of Europe all classes of the people are familiar with *Salmo fontinalis* of Humboldt and Cuvier. In America there was not, until recently, any confusion in the minds of the common people as to what was a brook trout. But Agassiz and Baird, who were content with the classification of their great predecessors in natural history, are dead, and *Messieurs les Savants,* dragging half the alphabet after their names, (as if the more letters they could flaunt the more the *oi polloi* were bound to submit to their superior knowledge) are, on the principle of *lucus a non lucendo* writing glibly about "vomers plane" and "vomers boat-shaped," "shafts elevated and shafts depressed," "teeth in rows or no teeth at all," "scales conspicuous or scales embedded," "black spots, red spots or gray spots," until a poor devil is so confused with the learned trifling that he begins to doubt his own eyesight and his ability to tell a sea salmon from a brook trout, which, by the way *Messieurs les Savants* now tell us is no trout at all, but only a miserable "char!" What has science gained? How has knowledge been increased by the learned jargon of these *fin de siècle* professors and adepts who, with scalpels and microscopes are counting the number of bony rays in dorsal and caudal fins, especially since no three of them ever agree in their count? Will the *oi polloi* know the brook trout any better because these savants have taken him out of the *Salmo* class and given him a brand new name? Will we know him any better as a *Salvelinus* than we have hitherto known him as a *Salmo?* Will he give more sport or taste better as a char than he did as a trout? Come, *Messieurs les Savants,* let up on us poor ignorami, for whom the old, universally known term, *Salmo fontinalis,* is good enough. Some of us are too old to learn your long-sounding new names; it will require two or three generations to make sportsmen forget the old familiar terms and to replace the familiar *Salmo* by the strange *Salvelinus.* Let up, *Messieurs!* You are only confusing a very simple matter, by applying to it your "science" and long words! What was good enough for Humboldt and Cuvier, Agassiz and Baird, Buckland and Huxley among naturalists, and "Kit North," Sir Humphrey Davy and Frank Francis among anglers, is good enough for us who have no time to split hairs and make distinctions without a difference. Were the Old Angler to try his hand at classification, his description of these New Savants would read something like this, and not an Angler in the world would have any doubt about the *animile: Order,* primates; *genus,* homo; *family,* college dons; *species,* Smithsonian; *variety,* fishmongers; *individuals,* fellows that "know it all." How Father Izaak would laugh at you and quietly pursue his angling for *Salmo salar* in the Tweed or for *Salmo fontinalis* in the Wye!

V.

(TO BE CONTINUED.)

*Note.—So far as we are informed, no authentic decision has ever been given on this vexata questio. Any answers we may receive to the Old Angler's question will be given in our Angling Column.—Editor FOREST AND STREAM.

The Rockefeller-Lamora Case.

A newspaper despatch from Glens Falls, N. Y., announces the decision by Judge Beman, of Malone, Essex County, N. Y., of a nonsuit in the case of Rockefeller against Lamora in the action brought for the recovery of penalties for unlawfully fishing in Mr. Rockefeller's private park in the Adirondacks. The defense showed that the waters of the park had been stocked by fish from the State hatcheries and at public expense, and Judge Beman declared that this was a complete defense under that clause in the law relating to private parks, which provides that waters stocked by the State shall not come within the provisions of the act. This means, as we interpret it, that when a private preserve has been stocked by the State, the owner cannot recover the special trespass penalties which the law prescribes. The well-established common law principles governing property and trespass are nevertheless in such cases still in force, and under these the land owner is still secured exclusive right of occupation or entry for any purpose whatever, hunting or fishing included.

Break the Chain.

Tell your friend you mean to spend your life fighting for money and power, and he will, if he be an average man, applaud your decision; tell him you mean to dwell in the country, gaining a simple livelihood from your labor, and he will either not believe you mean it, or will conclude you are a beaten competitor in the city's race. Most people do not know they are the slaves of their modern improvements, so-called. They build houses larger than they can occupy—for show; they pinch and scrape year after year to pay for them, and after that continue pinching to pay taxes, repairs and other maintenance charges. A large house demands expensive furniture. Then fine dress. And the demands increase. The man keeps his nose on the grindstone, the woman wears herself out taking care of the fine feathers. No time to just live and enjoy it; got to make a show first—going to take a real rest, and cut off all the little vanities, next winter—next summer—some other time, when matters are not quite so pressing. I am not exactly a loafer, but I like Walt Whitman best of all our American writers, because he had sense enough to "loafe and invite his soul" once in a while. I am tired of hearing the everlasting preachers of the "strenuous" life. Go slower, and you'll go farther and enjoy it better. Don't live to work; work to live. Bread and butter work, I mean. Leave a little time for the sort of work you find your chief pleasure in.—Frank Putnam in the National Magazine.

Canine Elegies and Epitaphs.

XXXI.—From the Greek.

Τὴν τρίβον ὃς παράγεις ἀλύπως τόδε σῆμα νοήσα
Μή, δέομαι, γελάσῃς, εἰ κυνός ἐστι τάφος.
Ἐκλαύσθην. Χεῖρες δὲ κόνιν συνέθηκαν ἀνακτος
Ὅς μου καὶ στήλῃ τόνδ' ἐχάραξε λόγον.

"Only a dog!" Yes, here a dog is laid;
Yet laugh not, stranger; there was one to love me;
He wept, dear Master! when I died, and made
This verse to mark the stone that stands above me.

Yachting.

Designing of Small Racing Yachts.

Lecture Delivered by W. Starling Burgess before the Society of Arts of the Massachusetts Institute of Technology, on Nov. 28, 1902.

THE designing of small racing yachts is probably the most fascinating branch of naval architecture, and one that appeals most to the majority of younger men. Unlike what is apt to be the case in the production of larger craft, all the details of the small racing boat are usually thought out and provided for by one man, there is but little specializing of the different parts of the work involved. Small help can be gained from the data obtained in larger vessels, the entire problem of design is a unique one, and governed by laws of its own. A very wide range is afforded for experiment, in the design of each new boat its forerunner is but little adhered to. As a result, failures have been many, and some most grotesque. Unlike a steamer, it is almost impossible to accurately predict a racing yacht's performance.

There are many subtle qualities which go to make up the elements of the successful craft which are at the present time wholly unknown. For instance, the proportions and various curves of the sails are an important factor, but we are in almost total ignorance of what these proportions and curves should be. To be sure, almost every sail maker and designer will have his pet theories; and it is significant that these are often at total variance with one another.

At the outset we must bear in mind that the sole object for which a racing yacht is constructed is to defeat every competitor that measures no larger under the rating rule to which both conform.

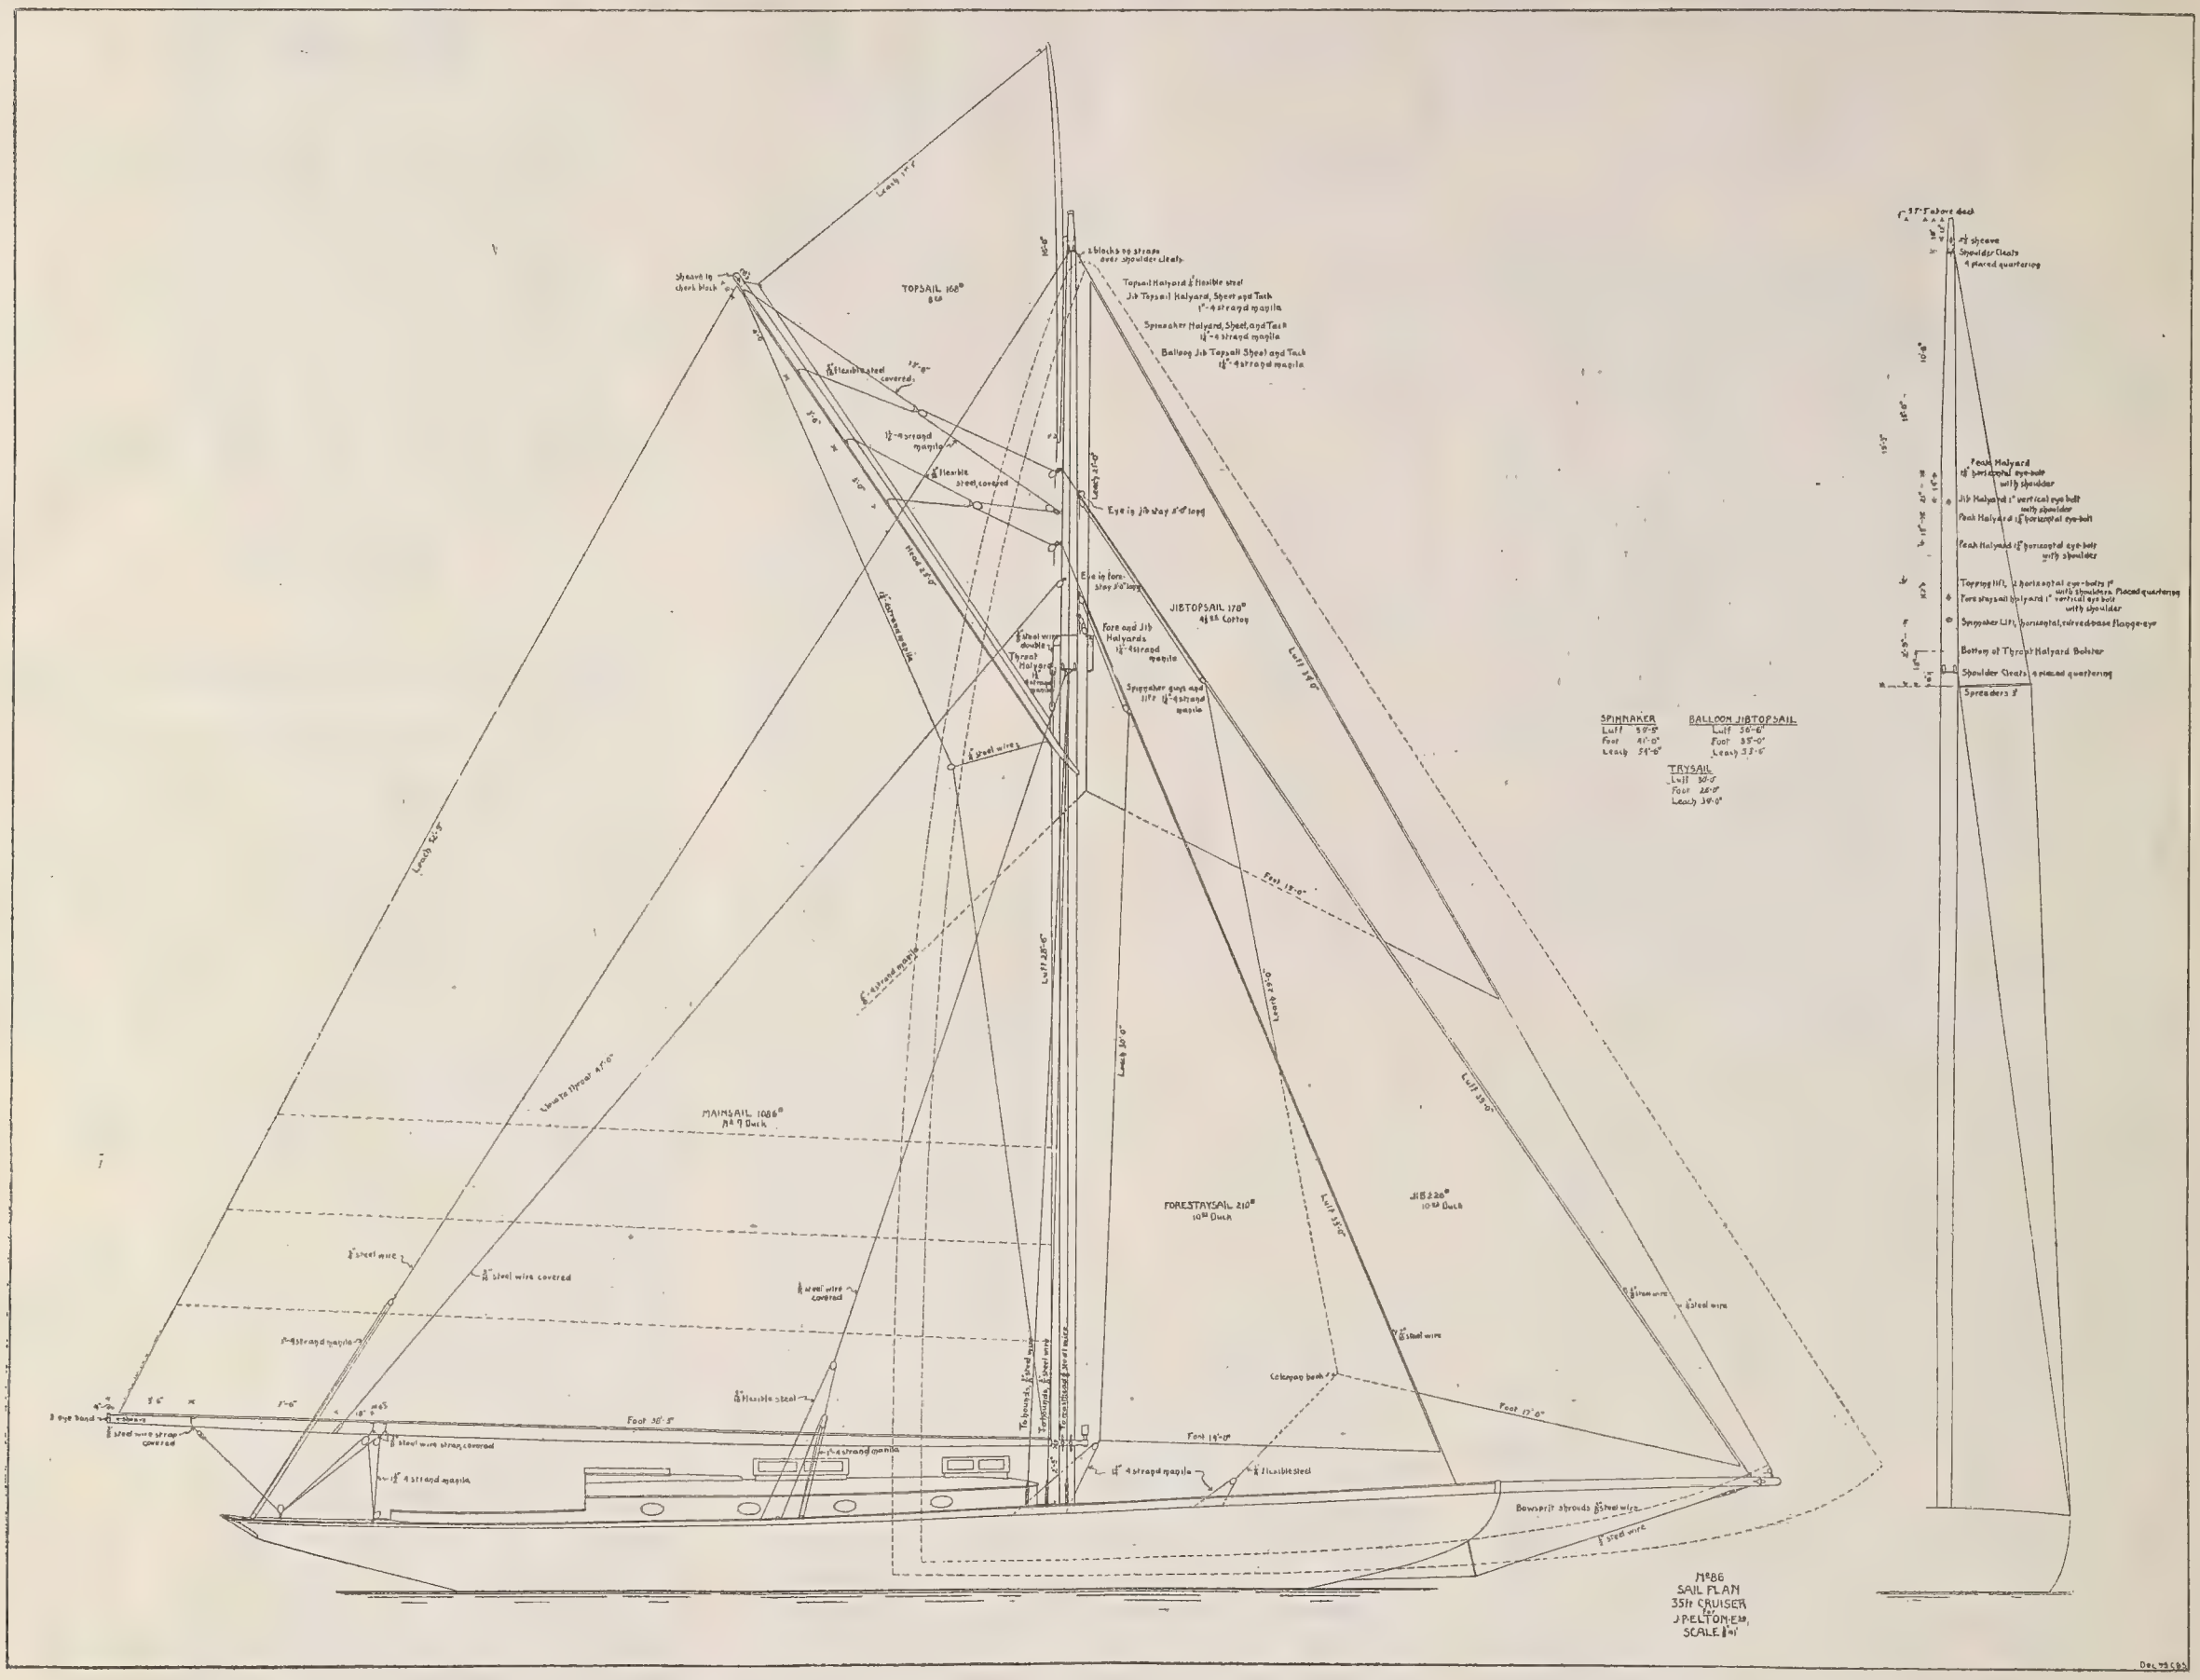
The most efficient steamer is that which for a given displacement gives the greatest speed for the least horsepower. Thus from the standpoint of the engineer, the most efficient sailing boat would be that which on a fixed displacement showed the highest speed for the smallest sail spread. However, rating rules in the past have almost never considered displacement and but seldom sail area.

The one standard of racing measurement has been length. In the days of the yacht America length of hull seemed a fair measure of speed. The clipper bow with graceful figurehead, and the narrow raking stern, while lending beauty to many of the early yachts, were in no sense speed elements and were rightly left untaxed.

From time to time attempts were made to tax the sail area in addition to the length of the immersed hull, and other elements were incorporated in the racing formula; but in this country in most of the so-called open classes the length of the immersed hulled alone has been the standard of measurement. Following the classical experiments of Froude—for many years the displacement was systematically increased, it being found that the greater stability or sail-carrying power which it afforded, more than balanced the wave making resistance it gave rise to. Thus the later boats designed by my father had enormous sail spreads, created great bow waves, and left heavy wakes behind them. If the displacement were left a constant it was found that three means remained, outside of lightness of construction, of increasing the stability. These were, first, increasing the water-line length, which being directly taxed was limited in each class; second, increasing the beam, which soon led to an altogether impracticable excess of wave making and wildness of steering; and third, increasing the draft, which found its limit under the conditions of the many shallow harbors of our coast.

Unlike the steamer, the sailing boat does not sail upright, but at a more or less great angle of heel. The length of the immersed hull was always taken when the boat was at rest, with sails furled, and in a vertical position. About eleven years ago it came to be realized that the above-water portion of the hull could be so shaped fore and aft that the immersed hull when heeled would have a length far exceeding that of the vertical hull, and that such excess of length would pass untaxed. This increased length was found to have three great uses: First, from the increase of length alone it allowed finer lines of entrance and run, and consequently less pronounced wave-making tendencies; second, it also gave increased moment of inertia to the inclined water-line plane, that is, it afforded a greater base or platform, so to speak for the lofty sail spread to stand upon; and, finally, it caused the center of buoyancy to shift to a greater distance to leeward of the centre of gravity when the boat heeled, and then a boat of the same weight or displacement had greater stability.

It was at first urged that the prolonged above-the-water hull would prove faulty in a seaway; that the long overhangs would pound in a dangerous manner, and that the extra weight of hull due to the long ends would offset the above-mentioned advantages. In well-designed craft of the smaller class this prediction was not fulfilled, and the overhanging hull found favor more and more. At first both the deck and water-lines closely resembled each



UMBRINA—CRUISING CUTTER—SAIL PLAN—DESIGNED AND BUILT BY THE MARBLEHEAD YACHT YARD FOR J. P. ELTON, 1900.

other, the deck-line only being somewhat longer and more sharply drawn out. Next, to give an increased moment of inertia to the load water-line plane and to form sharper sections of entrance and run when heeled, the water-line plane was filled out at the ends and brought to closely resemble a circumscribed rectangle. Thus the horizontal sections of the water-line became absolutely square and blunted at the stem and stern, resembling those of the ordinary mudscow; and hence arose the term "scow" as applied to racing craft. It might be thought that these square water-lines would be a great factor of resistance, but it must be remembered that the profile or vertical section lines showed but a slight angle to the surface of the water, and thus it was a case of a flat plate moving not normally to its line of advance, but skimming over and pressing down the water at a very acute angle.

As time went on the desirability was found of filling in or squaring the deck-line to an almost equal extent to the load water-line itself, for the boat with long overhanging square bow and stern thus held in reserve above the water an immense chamber of buoyancy, which on the smallest heel she could at once place in the water and at a great distance from, and consequently acting with a great leverage upon the centre of gravity. The enormous length of this untaxed out-of-the-water hull was exemplified most extremely in the Quincy cup defender Outlook of last season. This boat, whose immersed hull when vertical measured but 21 feet, was 53 feet on deck. Many of the scow type of boats, while sailing very fast in smooth water, were found to lose headway and almost stop when encountering a choppy sea. This was explained to a great extent by their forward overhangs striking the water at an oblique angle which tended with each pitch to arrest the hull backwards. This was overcome by the so-called reversed-curve bow, that is, a bow whose vertical contour and buttock lines, while rising somewhat sharply to the water surface, quickly reverse and run in straight lines over and almost parallel to the water surface. Such a boat when pounding struck the water with an alarming crash, but received no back-throwing impulse. When under way in a moderate sea the forward part of the Outlook's bottom bent like paper with each plunge. It sounded like wicker baskets under the blow of a pile driver. To derive the greatest possible advantage from this reversed-curve bow it is essential to have the horizontal contour line of the deck as nearly as possible a straight line all along the region of entrance, for otherwise it will have the effect of a bow with sharply rising buttock lines when heeled. This type of craft when measured by the length of immersed hull alone allows almost unlimited sail area, and will exhibit relatively marvellous speed as long as she holds together, but she is subject to the most unusual stresses, and from the very nature of her type must be built with most disproportionate lightness. Although most exciting to sail on, she must be considered rather as an abnormal development of a faulty rule than as a useful type of craft.

Sir William White says that the ablest designer is the one who under given restrictions turns out the ship which best meets the special requirements demanded, such as great cargo capacity, extreme speed, a heavy armament, or unusual steadiness in a seaway. As I have already said, the one requirement in a small racing yacht is speed. Therefore the designer must aim to conform to the restriction under which he builds, in the manner which shall least retard the racing efficiency of the yacht.

The successful yacht in a heavily restricted class is often referred to as a "disguised racing machine," and it is slightingly pointed out that while she doubtless complies to all prescribed measurements and weights, she really has the greatest proportion of sail area to weight, or of overhang to water-line length, or in some real or imaginary speed-giving element.

There is a satisfaction in going to the limit which may be indulged in in a small yacht. Unheard of dimensions, hulls whose length on deck more than doubled the load water-line and ratios of sail area to displacement apparently out of the question.

I shall try to describe briefly the phenomena that occur when a hull is moved a reasonable speed through still water.

If a flat plate is moved sideways through water, the fluid ahead will be seen to rise, then sweep around the edges of the advancing plate, curl in eddies in its immediate wake, and pass astern in fanlike, spreading ripples. To create these waves requires the expenditure of work in moving the plate, but were the moving body of such form that the stream lines of a perfect fluid, deflected by the stem were left with their original velocity and motion at the stern, no waves would be set up and no force expended. This ideal condition manifests itself to some extent under real conditions, for it is an actual fact that the stream lines, whose deflection offer great resistance to the advancing forebody, sweep in around, and, so to speak, squeeze forward the afterbody. This is but little realized, and may perhaps be better stated as follows:

The part of the work done in stream deflection by the forebody is given back in forward propelling impulses to the afterbody, just as the energy lost by the slowing piston of the steam engine is stored in the flywheel and given back in the return stroke.

Thus in a boat, if the afterbody is disproportionately shortened, the stream lines are unable to deliver their forward propelling impulses to the best advantage, and instead swerve around the counter in disturbed eddies, and waste their energy in useless waves. Or, in the other extreme, if the afterbody be too long or a straight middlebody of great length intervene, the skin pressure of the stream lines can have but a lifting or balanced side pressing effect, which yields a small forward resultant. It is also probable that in the case of a long, straight middlebody the action of the stream lines is delayed, and so to speak, damped out so that its effect when closing around the afterbody is partially destroyed. This tendency of a long straight middlebody has been demonstrated by towing models of steamers, where the wider ship with long fore and afterbody gave less resistance than the narrow hull with straight sides and comparatively blunted entrance and run.

It was determined at an early date that the resistance per square foot of a thin plate moving under water normally to its line of direction was a little over 100 pounds at a speed of 10 feet per second or 600 feet per minute. As the speed increased or decreased within reasonable limits, the pressure was found to vary as a little less than the square of the velocity (with the one and eighty-five hundredth power, according to the experiments of Calvert). It was also thought that for an angle of obliquity X of a plate to the line of its advance the normal pressure of the afterbody was the square of the sine of the angle of obliquity. Many sought to determine the resistance of hulls by considering their surface divided into many separates plates of unit volume and of varying angles of obliquity. However, no satisfactory results were obtained by this reasoning, and it finally gave place to the modern stream-line theory, so beautifully worked out by the late Mr. Froude. The stream-line theory does not attempt any arbitrary division of the immersed hull into separate plates or units, but, on the other hand, regards it as a whole.

Long before the advancing hull reaches a given spot, the particles of water begin to feel its influence, and are set in motion in different directions. As the stem approaches the particles on either side are not only caused to diverge, but are given a forward motion, and a zone or wave of water higher than the surrounding surface is formed at the bow, and as a given region of particles reaches the middle body, its speed sternward is greater than the outlying surface, then a depression of water is caused. This again gives place to a summit at the stern where the stream's line motion is also changed, and they, to a certain extent, follow and are urged forward at the hull. Not until the hull is well passed do the particles of water assume their original state. These retardations and accelerations of particles of water as the ship passes give rise to the bow and stern waves. To sum up the foregoing a little more concisely, it may be said that at the bow and stern the speed of the particles of water with reference to the advancing vessel is at its minimum and wave crests are formed, while on the other hand, amidships, where the relative speed is at its maximum, a wave hollow results; that is, the particles of water at the bow and stern are moving in the same direction as the ship relatively to the surround-

UMBRINA—CRUISING CUTTER—CABIN PLANS—DESIGNED AND BUILT BY THE MARBLEHEAD YACHT YARD FOR J. P. ELTON, 1900.

ing water. Just where the forward motion of the water stops and the sternward motion begins, must depend on the form of bow and length of entrance. Every vessel may be considered to have a line of nodes peculiar to itself, extending from the port and starboard bows along which all the particles of water are absolutely at rest relatively to the far outlying surfaces. With the sharp needle-like bow and long entrance as exemplified in the modern torpedo boat, the two lines of nodes will run forward at a sharp angle to the axis of advance and diverge but little from one another. On the other hand, when the bow is very blunted and the entrance short, the node lines will be greatly divergent.

Generally speaking, the greater the displacement the greater will be the force absorbed in wave making, and also the nearer this displacement comes to the water surface, the greater will be the disturbance. A torpedo towed but partly immersed has a greater resistance than when towed far below the surface. It is a common fallacy of belief that a bulb of lead retards a deep draft boat more than when placed near the surface of a shallower vessel. It is, in fact, most decidedly the reverse, other conditions being equal.

Unlike a perfect fluid, molecules of water flow past one another with certain difficulty, and a surface advancing in water will cause all the particles in immediate contact with it to move forward revolve in so-called frictional eddies and finally pass astern in a frictional wake. These eddies form a skin about the moving hull, whose thickness varies according to the velocity and length of the hull, and to the comparative roughness or smoothness of its surface. If a well varnished plank is moved through water, the surface nearest its bow or leading edge will be found to have a frictional resistance of nearly 4-10 of a pound per square foot, but this resistance per square foot will be found to rapidly diminish as the distance from the leading edge increases, finally assuming a value for lengths of fifty feet and upward of but little over 2-10 of a pound. This diminishing resistance is easily accounted for when it is considered that as the plank passes through the water it sets all the particles in immediate contact with it in motion in a direction similar to its own, so that the relative difference in motion is lessened as the distance from the leading edge increases, moreover, it has been determined experimentally that this decrease of friction no longr holds for lengths of surface over fifty feet.

The forward propelling tendency of the stream lines under the afterbody was well illustrated in the experience of the two triple screw cruisers, Columbia and Minneapolis. On these ships the two propellers were arranged, as is the ordinary custom, with twin screws and a third propeller in a well similar to that on the single screw vessel. Each propeller was driven by a separate engine, all designed to be of about equal horsepower. It turned out, however, that the central engine developed slightly more power than the port and starboard engines; instead of giving an increased number of revolutions, as would at first sight be expected, there was, on the contrary, a decided decrease in the number of turns. The pitch and diameter of all three propellers being identical, the only explanation was that the forward moving stream lines and skin friction eddies about the center line of the afterbody was to account for the increased resistance.

With the victory of the Defender in 1895, and the successes at the same time of many of the fin-keeled racing boats of the season, a reaction took place against the centerboard type of boat, and many made so bold as to state that the heavy ballasted type had once and for all vanquished the centerboard boats, in all classes above the diminutive half raters and other small skimming dishes. It was urged that the centerboard was more of a mechanical than a nautical contrivance, and even likened to shifting ballast devices, hinged hulls and even catamarans, and the great advantages of its extremely light draft and easy lined hull being entirely lost sight of. To my mind the cumbrous lead bulb hung far below the hull proper is a far less ship-shape device than a moderate form of centerboard.

The heavily weighted centerboard offers an entirely different problem. With the exception of the Harpoon, in her second racing season, few of the larger racing boats have derived much benefit from the heavily weighted board, and it is a curious fact that the increased statical stability, which on paper it would seem to afford, is not lived up to in practice. The light centerboard gives a decided capsizing moment to leeward, in fact it presses so hard on the lower windward edge and the upper portion of the leeward side of the centerboard box that it is usually impossible to raise it except in stays. In the heavily weighted board this effect is so neutralized by the weight of the board itself that it will lie almost neutral in the box and often vibrate from side to side.

We finally come to the questions of the most easily driven form and the form which offers the least wetted surface, always remembering that both ease of form and minimum of wetted surface have often to be sacrificed to increased power of carrying sail, and with the best results. It is a favorite joke with the rule of thumb men that a boat cut away to a nicety as to her wetted surface, will often perform wretchedly, but the same boat, when hauled out and given an enormous scag or other unusual additions to her keel, will sail steadier and much faster. This does not mean that wetted surface is an overestimated factor, but rather that the art of balancing a boat to get the best results is beyond the present method of calculation. In the case of sailing merchantmen, the early naval architects had to do with enormous slow-moving ships with proportionately insignificant sails and long, steadying keels. The rules which were deduced under these conditions for the so-called lead (that is the distance of the center of gravity of the planes of the sails forward of the center of gravity, of the profile of the under water hull), worked very well. However, when we come to apply these rules to the quick turning racing boat with its pivot-like keel and rudder almost amidships, we are led to grievous error. With later yachts it has

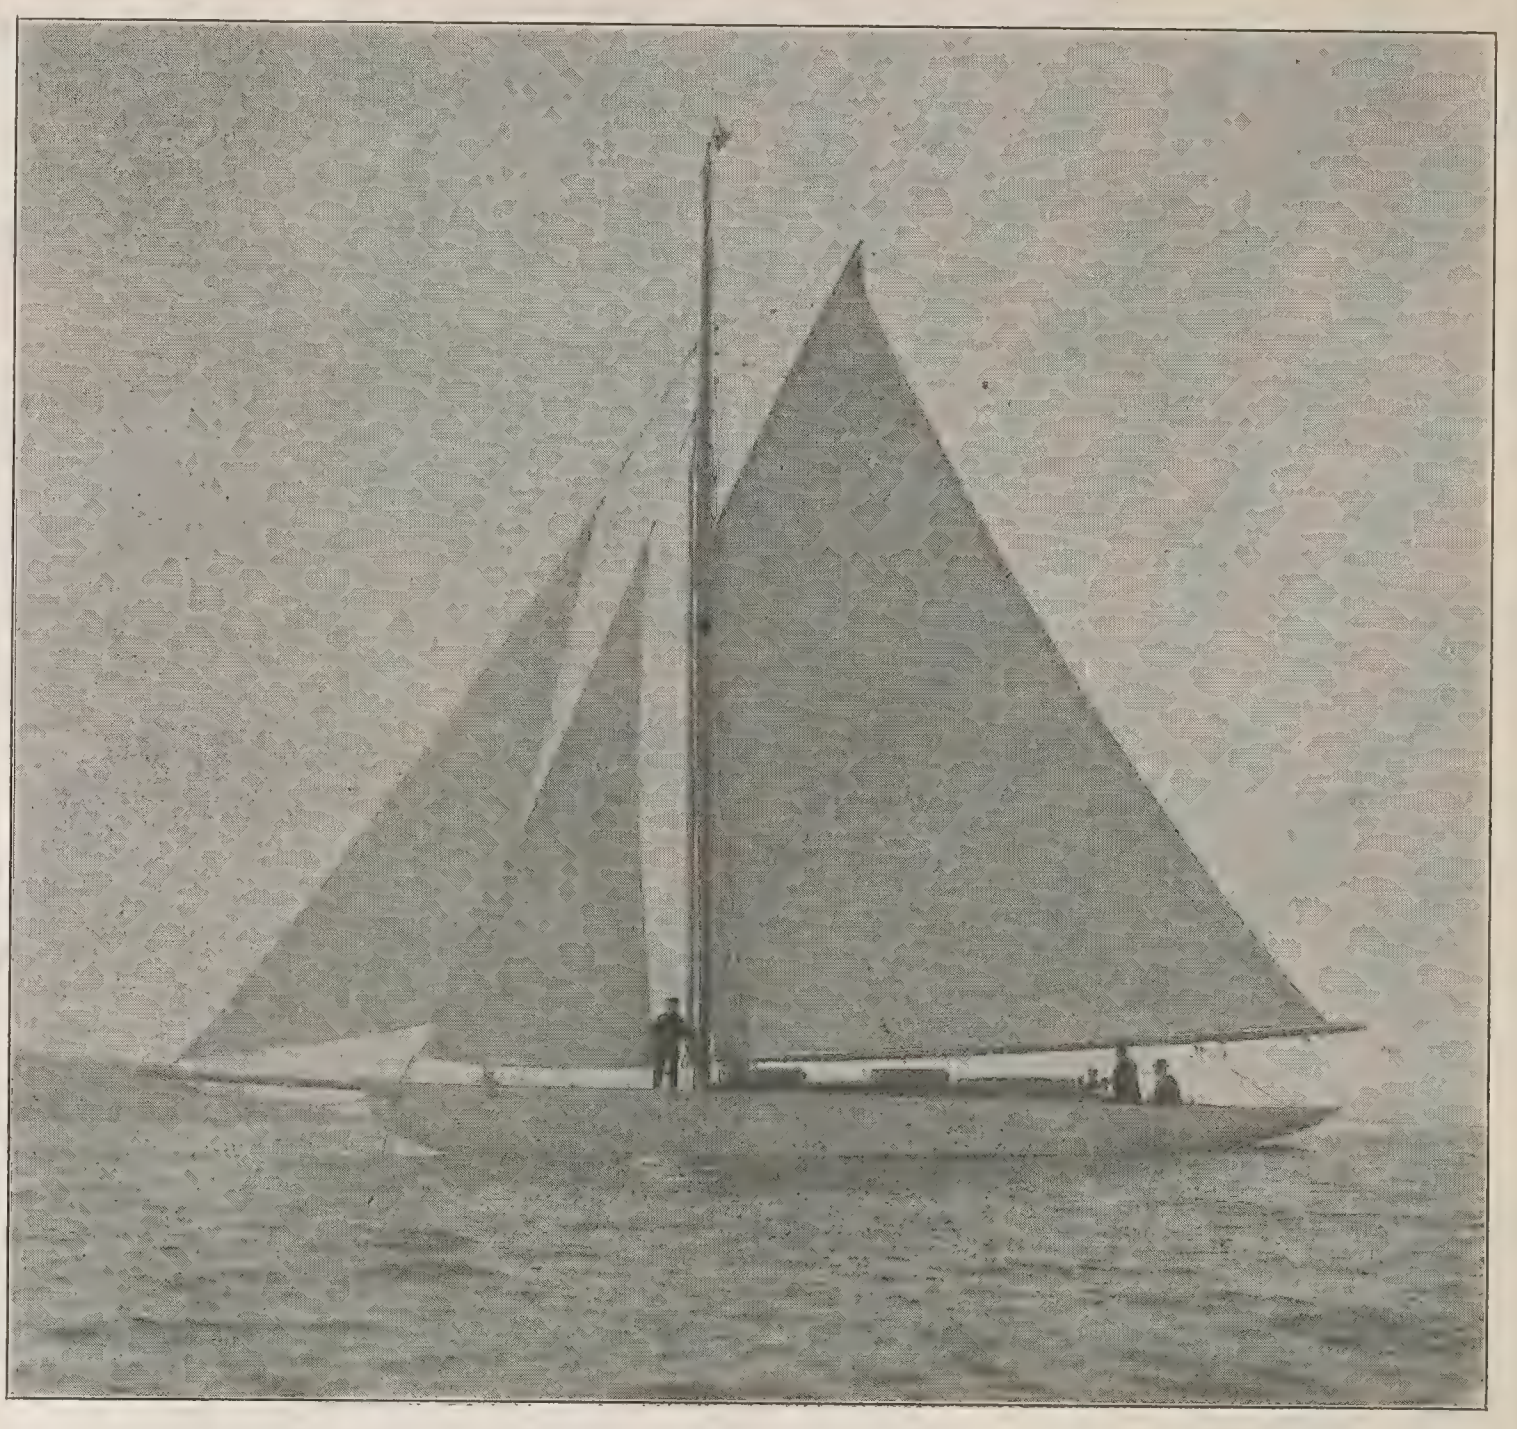
often been the custom for a designer to give up the attempt at nice balancing and provide his boat with the so-called sliding mast, that is, a mast whose position forward and aft could be readily changed by an adjustment of wedges.

There are two extreme opinions as to the use of scientific designing, the one holds that it is possible to calculate or in some manner to ultimately arrive at a highly developed and perfect form of hull, which for a given sail power will show such a balance of resistance as will result in the greatest obtainable speed. On the other hand, some say that it is all mere guess work, and one indiscriminate shape will do as well as the other. The latter being often supported in their views by the sight of the very wide shallow and blunted craft sailing on equal terms with the narrow, canoe-like type of boat. I think it may be safely said that mathematical theory alone will never evolve a perfect craft, even for given conditions, but on the other hand, I firmly believe that careful and appropriate experiment with much thought and precise methods of calculation will always place the art of designing higher and higher, and eventually entirely supersede all hit and miss methods.

Theory is much, but experiment must give the final touch, as Goethe said, "Gray is every theory and green the golden tree of life."

Umbrina.

The plans of Umbrina, published herewith, show one of the type of light draft 35ft. waterline keel cutters designed and built by the Marblehead Yacht Yard. In performance these boats turned out surprisingly well, being more than reasonably fast to windward and exceptionally fast off the wind. Umbrina is, perhaps, the most successful example of the type, not only in point of speed, but in seaworthiness and general comfort of arrangement. The two staterooms seem somewhat cut up, but as a matter of fact, there is plenty of elbow room even in the small one, and the convenience of the separate sleeping compartment appeals to many, especially when plenty of ventilation is provided for, as in this case. The main cabin is 7ft. 6in. long and the starboard stateroom is 7ft. long. The toilet room is 3ft. 3in. wide. The cabin house is 18ft. in length, and there is a waterway 2ft. 9in. wide all around. The galley is roomy and well arranged, and there is full headroom over a floor space 2ft. 6in. by 5ft. The forecastle has ample accommodation for the two men that are carried. The cockpit is watertight, and is 8ft. long and 6ft. wide.



UMBRINA.
Designed and built by the Marblehead Yacht Yard for J. P. Elton. Photo by Willard B. Jackson, Marblehead.

The boat is very handsomely finished below decks in figured mahogany. The cabin trunk is lined with mahogany. The beams are mahogany, and the deck is laid in two thicknesses, the inner of mahogany, so that with carefully arranged panel work the effect is exceptionally handsome.

The dimensions follow:

Length—	
Over all	52ft. 3 in.
L. W. L.	35ft.
Overhang—	
Forward	7ft. 9 in.
Aft	9ft. 6 in.
Breadth—	
Extreme	12ft. 11½in.
L. W. L.	12ft. 5¾in.
Draft—	
Extreme	6ft. 6 in.
Freeboard—	
Forward	4ft. 5 in.
Least	2ft. 9 in.
Taffrail	3ft. 2 in.
Displacement	33,000 lbs.
Ballast	14,000 lbs.
Sail Area—	
Mainsail	1,086 sq. ft.
Forestaysail	210 sq. ft.
Jib	226 sq. ft.
Area lower sails	1,522 sq. ft.
Topsail	168 sq. ft.
Jib topsail	178 sq. ft.
Total area	1,868 sq. ft.
Center of mast from stem at l. w. l.	5ft.
Bowsprit outboard	5ft. 9 in.

MANHASSET BAY CHALLENGE CUP FOR 30-FOOT SLOOPS.

YACHTING NEWS NOTES.

Greene Bros., of Bridgeport, Conn., are building a 66ft. auxiliary for Mr. John A. Serrell, of Bayonne, N. J. The yacht will be fitted with a Globe engine.

Messrs. Herreshoff & Wells have gotten up plans for a one-design class for members of the New York Y. C. The boats are 25ft. waterline, 40ft. over all, 10ft. breadth and 4ft. 6in. draft with the centerboard up and 8ft. with the board down. There is 1,100 sq. ft. of canvas in the lower sails. It is expected that eight of ten boats will be built, and all of them will be ready for delivery by May 15.

The auxiliary steam yacht Elsa has been sold by Mr. Evans R. Dick, of the New York Y. C., to Mr. Max C. Fleischmann, of Cincinnati, through the agency of Messrs. Gardner & Cox. The Elsa was formerly the Black Pearl, and was designed by Wm. Fife, Jr., and built by Culyean Shipbuilding & Engine Co., of Scotland, in 1885. She is of steel construction, 162ft. over all, 144ft. waterline, 23ft. 3in. beam.

The steam yacht Maria, owned by Vice-Commodore Frederick G. Bourne, N. Y. Y. C., arrived at Newport on Tuesday morning, Dec. 16. She was eleven days, sixteen hours from Fayal, and twenty-six days from Queenstown. Very rough weather was experienced, but the yacht behaved well, and Captain Archibald Learmouth, who brought the vessel out, speaks highly of her seagoing qualities. Mr. Bourne and Mr. Geo. A. Cormack, Secretary N. Y. Y. C., met the yacht at Newport and came down the Sound in her. Maria is now at the works of the W. & A. Fletcher Co., Hoboken, N. J., where she will be generally overhauled.

The annual report of the Regatta Committee of the New York Y. C. has been printed and has been distributed among the members. The report is very complete and well gotten up.

The Regatta Committee of the Atlantic Y. C. announce the resignation of Captain George Hill as Chairman of the Regatta Committee, and the election of Captain Henry J. Gielow as Chairman, to fill the unexpired term. The report of the committee has been printed and sent to the members.

English Letter.

The names of the owners of the new one-design class for the Solent have been published, and it is a very influential list, viz.: The Earl of Albemarle, Earl of Arran, Lord Brassey, Baron Eckhardstein, Mr. John Gretton, M. P., the Hon. Alwyne Greville, Capt. Richard Charteris and Capt. J. Orr-Ewing—eight to start with, and with power to add the whole aristocracy to their numbers. Now, nobody could grumble at this movement, were it not for the fact that it will infallibly kill open racing in the 36ft. and probaly in the 30ft. class on the Solent. The owners have chosen a design of almost the same dimensions as a 36-footer, the loadline length being 34ft. 6in. The boats have only one cabin. It may be very satisfactory so far as racing is concerned, but the movement on the part of wealthy men is characteristic of that selfishness that has (being quite unchecked by legislation) directly led to the collapse of our yacht racing. Capt. J. Orr-Ewing is a member of the Council of the Yacht Racing Association, which, as the representative organization of British yachting, has never received a more deadly blow than this. I have been responsible, perhaps, for the establishment of more O. D. C. classes than anyone, and I have always favored the idea as being productive of good sport among men of moderate means who cannot otherwise afford to race; but hitherto these classes have not interfered with open racing in any marked degree. This South Coast class, as it is called, is a very different matter.

No authentic news about the new challenger is forthcoming. I believe she will have a more easy bilge than Shamrock I., but that belief rests on very slender foundations. Sir Thomas Lipton declares that the design is the very best that has ever been seen. As to that I would prefer to rely upon my own belief in Mr. Fife's talents, for I do not forget that on two former occasions Sir Thomas used almost the same words. The yacht will be ready for launching in April next. At the yard, where she is building, there was a serious fire last week, and the challenger was in some danger. Happily, however, she was uninjured.

On Monday last Col. McCalmont died very suddenly as he was leaving his house. His death is deeply regretted, for he was a splendid all-round sportsman. He built the great steam yacht, Giralda, which was

bought by the Spanish Government at the outbreak of the war with you. Giralda carried some machine guns, and could steam at a little over 22 knots. She was a very smart-looking vessel, of a much more rakish appearance than is usual now among very large steam yachts. His last yacht was the little torpedo-boat-like craft, Tarantula, which was launched last summer, and is the first turbine steam yacht ever built. It is said that Col. McCalmont had some share in the Valkyrie III. syndicate.

It is stated that a project is on foot to make a canal from the Thames to Southampton. If this is accomplished it will have a wonderful effect on Solent yachting, for no doubt all sorts of unseaworthy craft in the shape of houseboats, launches, etc., will be constantly passing to and fro. There is also some talk of laying down a motor-car road alongside the canal. The project is a big one, but it would have very pleasant results.

The newly formed Marine Motor Association is still in the midst of its troubles over a rule for rating engines. There does not seem to be much prospect of reaching finality, but the committee considering the matter is very earnest, and has several experts in its number. By experts I mean trained engineers who are making motors, not the man who occupies his time in shouting out that he knows more than anyone else. One member of the association has decided to build an unrestricted 40ft. launch at once. From his engine scheme I expect he will take some beating.

The Clyde, after very long thought, has at last produced an order for one 30-footer. Our sport is now in such a parlous way that this is quite an important item in itself, but it is also interesting because it is the beginning of a new Y. R. A. class. Whether it will succeed is more than doubtful, for the 36-footers are none too favorably regarded up North. Still, time was, and not so long ago, when the Y. R. A. classes were quite unrepresented on the Clyde for many years. This little boat is being built by Messrs. Fife. By the way, the new South Coast O. D. C. is from Mr. Alfred Mylne's design. He is also designing a 52-footer for a London owner whose name I know, but fear to reveal, lest some evil should befall somebody. No owner of any new boat as yet ordered has allowed his name to be disclosed.

Quite a large fleet of cup defenders are building, according to reports cabled over here from New York. I rather fancy that one with 40ft. beam and the centerplate. I wonder your pressmen do not design more of them. Our editors love to have them, and they like them tall and broad. You can cable over at least five more without the slightest fear.

E. H. HAMILTON.

Boston Letter.

BOSTON, Dec. 21.—Prospects appear to be at present somewhat brighter for racing among the smaller classes in Massachusetts Bay during the coming season, although it is not expected that there will be nearly the enthusiasm that was manifested during the three previous seasons, and especially last year. The class which will hold the greatest number of boats will be the 18ft. knockabout class. Yachts for this class are being constructed all over the bay. There are so many that it is very hard work keeping track of them. Many of the owners are desirous of keeping under cover, too, and it is likely that the full complement will not be brought to light until the opening of the racing season of 1903. It is safe to say, however, that there are more than a dozen 18-footers under construction. Burgess and Packard have orders for eight, and the other designers, while not getting so many, have received a good share. In the midsummer series of the Hull-Massachusetts Y. C. last season, there were from 15 to 17 of these little fellows in each day's race. That was not the full number, however. There were probably over 30 in different parts of the bay. It would not be surprising to find as many as 20 new ones when the season opens. While some of the older boats are being disposed of, there are few that are leaving Massachusetts waters, and, thus, the number to be seen at each race throughout the season may be expected to be very large.

There is not much being said about the new 22-footers, although Sumner H. Foster, sponsor for the class, was in the best of spirits last week. He said he had been informed that there were 5 new boats for this class already under construction, but he could not say for whom they are being built. As a matter of fact, Burgess has actually orders for two of these boats, while an order for a third is pending. Fred Lawley has been reported to have orders for four, but according to his own statement, he has not yet been told to go ahead on the plans of any. It is said that a boat for the class is being constructed for Mr. John Greenough by Archie Fenton, of Gloucester. It is not known that Shiverick, of Kingston, has any orders for 22-footers from any of the Duxbury contingent. One of the yachtsmen who was most anxious to have the class adopted by the Yacht Racing Association, and who is loud in his praises of the boat that can be produced in the new class, made the statement last week that his new 18-footer was well along toward completion. It does seem funny that he did not go up 4ft. on waterline length and get one of the boats he admires so much.

There are no new restricted 21-footers being built, and it does not look as if there will be. Nothing more has been heard from the movement among some of the owners of yachts in this class to race among themselves, to the exclusion of the freaks. It is likely, however, that some such arrangement will be made before the racing season opens. In the 25ft. class there now seems to be some prospect of racing, this all having come about through orders to Burgess and Packard to design four of them. With this number there is no doubt the clubs will give them races, such as they are. To say that these boats, built to the limits of extremes under the rules, are undesirable and at variance with the effort to get a safe, seaworthy boat, would be putting it mildly. E. A. Boardman has turned out a full model of a boat that can be built under the rules. She is not so long on top as some of those which have been designed, but, if she were supplied with a square bow, instead of the apology for a sharp one, her model might easily pass for that of Hostess, Lookout or Outlook. A glance at her will convince any rational yachtsman that he does not want to monkey with a class whose rules permit such freaks. And still the delegates, or rather a majority of the delegates, to the Yacht Racing Association, declared by vote that the present rules are all right, and that no changes should be made.

Two notable schooners changed hands last week. Puritan, the defender of the Cup in 1885, the first of the yachts which has done so much to revolutionize ideas in designing and the yacht which established the standing of the late Edward Burgess as a naval architect, was sold by Commodore John O. Shaw, Jr., of the Corinthian Y. C., to Mr. C. H. W. Foster. The sale was made through the agency of Hollis Burgess. Mr. Foster intends to further alter Puritan by adding a 20 horse-power gasolene engine. The schooner is as beautiful and as much admired as ever. Outside of a little leaking around the centerboard box, she is as sound as in the days of old. This may be remedied, but if it cannot be fixed easily, the center-board box will be plugged up and she will be made a keel boat. To take the place of the Puritan, Commodore Shaw has purchased the schooner Alert, until recently owned by Mr. Clement A. Griscom. The sale was made by Arthur Binney.

At Lawley's the cabin work is being put in the 50ft. ketch for Mr. J. H. Cromwell. The deck is being laid on the 60ft. schooner for Mr. C. H. Clark. Mr. F. H. Adriance's 34ft. yawl has been planked and the deck is being laid. A 36-footer for Mr. W. C. Rogers and a 21-footer for Mr. J. H. Spalding have been set up. The Cox 18-footer is partly planked. The deck is being laid on Mr. C. A. Fletcher's steam yacht. The Emery steam yacht, designed by Cheseborough, has been laid down. It is reported that the Lawley Company has secured an option on the tract of land, adjoining its yard, upon which stood the house of correction and the insane hospital. It is a very large parcel and has a fine water frontage, although it will have to be dredged for any large work. It will be interesting to learn how the company will dispose of it.

Frank N. Tandy has an order for a 40-rater under the new measurement rules, for a Western man, who summers at Marblehead. She will be 52ft. 1½in. over all, 33ft. waterline, 11ft. 6in. beam and 7ft. 6in. draft. She will carry 2,004 sq. ft. of sail.

The yacht yard and shop of Pryor and Clark, at North Weymouth on the Fore River, has been leased by W. W. Meek & Co., who will carry on the business of yacht designing and building. Mr. Meek was senior draftsman for Lewis Nixon and has also been with Neafie and Levy.

Smith, of Quincy Point, is at work on a 21-footer, designed by Crowninshield for Mr. Joshua Crane, Jr. She will be raced in Buzzards Bay.

Burgess and Packard have received an order for a 40-rater, under the new measurement rules, for Mr. R. H. Morgan, of Boston. They have also an order for a 22-footer for Mr. Herbert White, and report that Mr. Sumner H. Foster's 22-footer, building by Hodgdon, of Booth Bay, is well along.

E. A. Boardman, recently with Crowninshield, has started out on his own hook with an office at 20 Central street. He has already received orders for two 18-footers for Boston parties, and is considering plans for two 15-footers and a 45ft. speed launch.

Small Bros. have turned out the lines for a one-design class of 18-footers on the order of Mr. W. R. Carson. Four have been ordered, which will be built and raced at Calais, Me.

JOHN B. KILLEEN.

Rifle Range and Gallery.

Ossining Gun Club.

OSSINING, N. Y., Dec. 22.—In the re-entry rifle contest, open to non-members, the following 5-shot scores were made at 50ft. on the ¼in., 25-ring target, two best scores to win; prize, a Winchester model 1890 rifle, with gallery sights: Fred Bellington 113; Jas. Schmidt 116, 113; Frank Tompkins 115, 113, 118, 119; Fred Tompkins 111, 112.

Practice scores, 5 shots at 50ft.: G. Tompkins 119, 116, 118; J. Schmidt 114, 107; Wm. Fisher 118; C. G. Blandford 121, 114; Wm. Coleman 116, 109, 110, 115; C. H. Sidman 118, 117.

Matches at 50ft.: C. G. Blandford 117, Wm. Coleman 115. Wm. Coleman 117, C. G. Blandford 115. C. G. Blandford 117, Wm. Coleman 110. C. G. Blandford 242, Wm. Coleman 236. Wm. Coleman 236, C. G. Blandford 231.

Ten-shot scores, 75ft.: C. G. Blandford 235, Mrs. E. F. Ball 217, Dr. E. B. Sherwood 208.

Matches at 75ft.: C. G. Blandford 230, E. F. Ball 228. E. F. Ball 237, C. G. Blandford 235. E. F. B.

A special feature of the ninth annual Sportsmen's Show, to be held in Madison Square Garden the week commencing Feb. 21, will be rifle and revolver tests, beside other kinds of competition. Capt. J. A. H. Dressel, 313 Broadway, is the General Manager.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Dec. 25.—Dover, N. J.—Holiday live-bird shoot of the Dover Gun Club. Bull shoot the special event.

Dec. 25.—Interstate Park, L. I.—John S. Wright's target tournament, sweepstakes, etc.

Dec. 28.—Brooklyn, L. I.—Fulton Gun Club's shoot. Albert A. Schoverling, Sec'y.

Hell Gate Gun Club's shoot, fourth Tuesday of each month (July and December excepted), at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Hell Gate Annex shoot, second Friday of each month (January and July excepted), at Dexter Park, Brooklyn.

Brooklyn Gun Club's shoot, Saturdays, at Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

South Side Gun Club's shoot, Saturdays, South Broad street, Newark, N. J., near Lehigh Valley coal depot.

Outwater's grounds, Carlstadt, N. J., Saturdays, live-bird handicaps.

1903.

Jan. 1.—Poughkeepsie, N. Y.—Inter-county shoot and tournament of the Poughkeepsie Gun Club. Max Condit, Capt.

Jan. 1.—Paterson, N. J.—Open live-bird shoot of the Jackson Park Gun Club.

Jan. 1.—Rutherford, N. J.—New Year's Day target shoot of the Boiling Springs Fishing and Gun Club. C. B. Axford, Sec'y.

Jan. 1.—Interstate Park, L. I.—New Year's Day target tournament.

Jan. 1.—East Rutherford, N. J.—Match at 50 live birds, $100 a side between C. Fleishman and John Heflich, at Hackensack River Bridge.

Jan. 1.—Towanda, Pa.—Annual tournament of the Towanda Gun Club; live birds and targets. W. F. Dittrich, Sec'y.

Jan. 1.—Wissinoming, Pa.—New Year's Day target tournament of the Florists' Gun Club; open to all.

Jan. 1.—Newark, N. J.—New Year's Day shoot of the South Side Gun Club.

Jan. 8.—Newark, N. J.—Match between J. W. Hoffman, New Germantown, Pa., and C. Steffens, New York, 100 live birds each, $100 a side, on Smith Brothers' grounds.

Jan. 13-15.—El Paso, Texas.—Grand midwinter carnival shooting tournament, under auspices of the El Paso Gun Club. W. H. Shelton, Sec'y.

Jan. 13-16.—Hamilton, Can.—Hamilton Gun Club's thirteenth annual grand Canadian live-bird handicap tournament.

Jan. 26-30.—Brenham, Texas.—Second annual Sunny South Handicap; live birds and targets.

Jan. 15.—Guttenburg, N. J.—Eastern three-man team live-bird championship, $7.50 per team, birds extra. For information address Gus Greiff, 318 Broadway, New York.

Feb. 9-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club. Percy S. Benedict, Sec'y.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 9-11.—Cincinnati, O.—Seventeenth annual tournament of the Ohio Trapshooters' League. Chas. F. Dreihs, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The programme of the Sunny South Handicap at live birds and targets, to be held at Brenham, Texas, Jan. 26 to 31, inclusive, provides competition of four days at live birds and two days at targets. The Sunny South Handicap is a 25 live-bird event, $20 entrance, birds included, handicaps 26 to 31yds. The following is quoted from the published conditions: "All entries to this event must be made by Jan. 15, and accompanied by a $5 forfeit, made payable to Alf Gardiner, manager, Brenham, Texas. Money in this event will be divided 40, 30, 20 and 10 per cent.; class shooting. In addition to first money in this event, the winner will receive a handsome silver cup, value $100. To this event we now have the forfeits of ten Brenham amateur shooters, who have signified their intention of shooting, and deposited these forfeits with us in good faith. We have the promise of others in our city. Make your entries to this event and attend a good shoot. Sunny South Handicap at targets, 100 targets, $10 entrance; handicaps, 14 to 20yds. Five moneys, 30, 25, 20, 15, 10 per cent.; class shooting. In addition to first money the winner of this event will also receive a handsome silver trophy. Shooters who like high gun shooting can arrange a side purse with secretary in these events, to be divided on the high gun system."

The secretary, Mr. W. H. Shelton, informs that "the Grand midwinter carnival shooting tournament under the auspices of the El Paso Gun Club will be given in El Paso, Texas, on Jan. 13 to 15, 1903. Professionals and manufacturers' agents allowed to shoot for targets only. There will be fifteen events, five each day, from 9 A. M. to 1 P. M., the balance of the day to be taken up with other carnival attractions. Added money will approximate $1,000, to be divided under the Rose system, ratios 7, 5, 3, 2. Ten-gauge guns and black powder barred. Interstate Association rules of 1902 to govern. Shooting over magazine trap, known trap and unknown angles. There will be specially low rates on the eight railroads reaching El Paso. Programmes will be mailed on application."

The Florists' Gun Club announce a target tournament for New Year's Day, at Wissinoming, Pa. It is open to all. Three sets of traps will be available. Sweepstake shooting will commence on the arrival of the 9:58 train. Upon the arrival of the 1:50 P. M. train from Broad street a merchandise event and a five-man team match will be shot. There are ten events on the programme, six at 10 targets, 50 cents entrance; two at 15 targets, 75 cents entrance, and one 25 cents entrance to which $5 is guaranteed; merchandise event, $2 entrance; five-man team match, $3 entrance; 30 targets, handicaps added.

The Richmond Gun Club have announced a holiday shoot for Christmas Day, at Concord, Staten Island, commencing at 10 A. M. The secretary, Mr. Albert A. Schoverling, writes us: "New grounds; new club house; everybody welcome. To reach the grounds from New York, the ferry boat to St. George, thence Silver Lake trolley to the junction of Clove road and Richmond turnpike; thence shuttle car to the grounds, or ten minutes' walk in place of shuttle car. The grounds are at the corner of Serpentine and Clove roads."

The Breeder and Sportsman of Dec. 13 contains the following pleasant personals: "Harvey McMurchy has been here for several weeks. 'Prince Mac' says he has greatly enjoyed the duck shooting he has been having, twice a week, at the Spooney Gun Club preserve, near Mt. Eden. Phil B. Bekeart is dated for a return appearance here about the 20th inst. Jack Fanning, a sportsman universally liked and widely known, will also make his appearance on Sportsman's Row on or about the 20th."

On Wednesday evening of last week, Capt. J. A. H. Dressel gave a banquet and theater party to his staff of shooters and missionaries, a list of whom follows: Messrs. John E. Avery, Frank E. Butler, J. L. Head, John S. Cole, Jr., T. W. Morfey, Malcolm Moore, L. J. Standish, F. C. Riehl, Geo. T. Little, S. M. Van Allen, S. D. Woodhouse, George Bingham and A. H. Myerhoff.

Messrs. C. Fleishman and John Heflich have agreed to shoot a match at 50 birds per man, $100 a side, Interstate rules, loser to pay for birds. Date and place are Jan. 1, on Heflich's shooting grounds, Hackensack River Bridge, near East Rutherford, N. J. Fleishman will stand at 30yds., Heflich at 26yds. Mr. Carl von Lengerke holds a forfeit, and has been agreed upon to act as referee.

On Jan. 15, at Guttenburg, N. J., there will be a three-man live-bird Eastern team championship. The teams to be composed of members of clubs, and any club may enter as many teams as it pleases. Entrance $7.50 per team, birds extra; 28yds. rise. The winning team will receive three cups, one for each member, beside 50 per cent. of entrance; second team will receive 30 per cent; third team, 20 per cent. For further information, address Mr. Gus Greiff, 318 Broadway, New York.

The Bound Brook (N. J.) Gun Club announces an all-day shoot for Dec. 27, commencing at 10 o'clock. There will be a dead mark shoot—that is, shooting at a block of wood—for a quarter of beef. The shot sticking in the block and nearest to its center wins. Turkeys and chickens are also on the prize list. If the 27th is stormy, then the shoot will take place on the following Wednesday.

Mr. C. B. Axford, secretary of the Boiling Springs Gun Club, Rutherford, N. J., writes us as follows: "On account of the date conflicting with that of the Jackson Park Gun Club, the Boiling Springs Gun Club have postponed their live-bird shoot of Jan. 1 to some future time. There will be a target shoot instead, beginning at 1 o'clock P. M."

The match at 100 targets between Messrs. Harry M. Brigham and J. S. Schenck Remsen, both of Brooklyn, was won by the former at the shoot of the Crescent Athletic Club, held at Bay Ridge, L. I., to-day. The scores were as follows: Brigham 92, Remsen, 85.

On Monday of this week Messrs. J. W. Hoffman, of New Germantown, Pa., and C. Steffens, of New York, made a match at 100 live birds, $100 a side, to be shot on Smith Brothers' grounds, Newark, N. J., Jan. 8. Mr. S. M. Van Allen holds a forfeit.

Mr. A. Felix defeated Mr. Geo. Bauer in a match at 100 live birds, at Point Breeze race track, Philadelphia, on Dec. 20, by a score of 79 to 71. The match stopped in the ninety-third round, Bauer then being shut out.

Mr. Albert A. Schoverling, corresponding secretary, informs us that the Fulton Gun Club will hold a shoot on Dec. 28. The grounds are about ten minutes' walk from the Crescent street station, Kings County Elevated.

The Towanda (Pa.) Gun Club announces it will hold its annual tournament on Jan. 1. There will be events at live birds and targets. The secretary is Mr. W. F. Dittrich.

Messrs. C. E. Willard, of Chicago, and Ed Rike, of Dayton, O., were visitors in Sportsmen's Row, New York, in the latter part of last week.

BERNARD WATERS.

Arkansas Championship.

PINE BLUFF, Ark., Dec. 17.—In an open contest for the Peters Cartridge Co. trophy, emblematic of the live-bird championship, J. A. Coles, holder, of this city, successfully defended his title against eight other aspirants. In this race he simply outclassed the other contestants, as he beat his nearest competitor four birds; that, too, after making a bad start, losing his first bird. After this, however, he settled down to business and shot in rare form, killing out straight to the end, and thereby aggregating the very fine score of 24 out of 25, on the very best lot of birds the writer has ever seen trapped in Pine Bluff, the majority of which were fast drivers. Up to the fifteenth round there were several others factors in the race, but from thence on there was nothing to it but Coles, as all the other contestants experienced a few bad minutes, which put them out of the race.

Coles came into possession of the trophy on Thanksgiving Day, when he won it in a similar contest with the same score in a field of twelve. Prior to this I. J. Vick, also of Pine Bluff, was the holder, he having won it in open contest at Stuttgart last September, on which occasion he killed 25 straight. At the Stuttgart shoot R. W. Larkan, of De Valls Bluff, was the runner up with 23 to his credit. Aside from the victory above referred to, Vick also successfully defended the trophy against Coles in an individual contest. This match took place in October, and Vick scored 25 to Coles' 21.

The contest of to-day is the third open one of the season, but others are sure to follow, as the rules governing such contest permit any club to redeem the trophy from the holder and put it up in open competition. This provision was added at the last meeting of the Arkansas State Sportsmen's Association, and has greatly stimulated the interest in the trophy.

The conditions of the contest call for 25 live birds, 30yds. rise, Interstate rules.

The weather to-day was all that could be desired, bright and clear, but with little wind, though a keen, sharp atmosphere had an invigorating effect upon the birds as well as the shooters.

At the request of the principals, Paul R. Litzke, of the Peters Cartridge Co., acted in the capacity of referee and scorer, though one of the contestants himself. Scores follow:

Coles	0221122211221211111121111—24

Dr. Joseph Charles.

THE preamble and resolutions concerning the death of Dr. Joseph Charles, passed by the Chesapeake Gun Club, are as follows:

We, the committee appointed by the Chesapeake Gun Club to draft resolutions over the death of Dr. Joseph Charles, most respectfully submit the following:

Whereas, It has pleased Almighty God to take from our midst our beloved friend and fellow sportsman, Dr. Joseph Charles;

Therefore, Be it resolved by the Chesapeake Gun Club that, while bowing in humble submission to His will, we feel keenly the loss and sincerely regret the death of our departed friend.

In his death we lose not only our truest sportsman, but one whose pure, manly character, unbounded liberality, and ever readiness to serve, had endeared him to the hearts of every member of the club.

To his widow and immediate family we extend our heartfelt sympathy.

Be it further resolved, That a copy of these resolutions be duly forwarded to his widow, the several gun clubs in our State, and to the Virginia Trapshooters' Association.

E. S. ROBINSON,
THOS. F. STEARNES,
G. B. JAMES,
} Committee.

NEWPORT NEWS, Va.

Ossining Gun Club.

OSSINING, N. Y., Dec. 20.—The main event at our shoot to-day was a 25-clay-bird, misses as breaks, handicap for a cup, being one of a set of four presented to the club by the president, Mr. F. Brandreth. The attendance was nothing to brag of, but the scores made were A1. The birds were thrown full 50yds., in spite of which the first four broke 90 out of 100 without their handicap allowances. Mr. E. F. Ball was the star performer with a score of 24 out of 25; he had an allowance of 2, one of which was superfluous. Wm. Fisher was second with 20, which, with his handicap allowance of 5, gave him a clean score. On the shoot-off under original conditions, Fisher got 22, while Ball went straight without his handicap. As Mr. Ball has only been shooting about three months, this was a remarkable performance.

No. 3 was the prize shoot. The fourth column denotes misses added; the fifth column is the total; the sixth column the shoot-off.

C. G. B.

IN NEW JERSEY.

Clearview Gun Club.

The most important event was at 25 targets, handicap rise, the scores also to count for the club's main event of the year. There were five qualified to contest for the yearly prize, and Fisher won by scoring 20. The scores: Jones (16) 23, Smith (17) 23, Downs (16) 22, Barr (16) 22, Bell (16) 20, Fisher (17) 20, Franklin (17) 18, Davison (16) 16, Leicht (15) 16, Hill (14) 16,Bivens (14) 11, Yurrec (12) 8, Yardley (16) 5.

The open sweepstake events that rounded off the shoot were all at 10 targets, 16yds. rise, unknown angles.

First event: Franklin 9, Leicht 8, Fisher 8, Downs 8, Jones 7, Barr 7, Curry 6, Ludwig 6, Bell 6.

Second event: Fisher 9, Downs 8, Davison7.

Jackson Park Gun Club.

Paterson, N. J., Dec. 20.—The members of the Jackson Park Gun Club, of Paterson, N. J., are busily at work perfecting all arrangements for their New Year's live-bird shoot, which, from present encouragements, is going to be a great affair. The club is sparing no expense in getting first class, good, strong country birds throughout Jersey, so that no one will have any complaint to make about birds.

Capt. Lenone expects to arrange a programme for that day that will please every one that takes part in the shoot. The poor shooter will be looked after, and the good shooters will be able to get some money if he can stand the pace. Any shooter who so desires can shoot for birds only at all times at this club.

The committee on entertainment is composed of men hard to beat—ex-Capt. Johnny Powers, Ed. Morgan, Billy Stalter, George Hopper and T. C. Wright.

Garry Hopper is looking after the birds, and says everything is going along nicely. But wait till New Year's Day. Everything for the comfort of visitors will be looked after. The club house is well heated and has a glass front the entire length of the building, 40ft., so that everybody can see the sport. Everybody is welcome to be with us on New Year's Day, 1903.

The club shoot to-day brought out quite a crowd, good shooting and fair birds.

Big match Tuesday at Bunn's, 1 o'clock; Geo. Hopper vs. Ed. Klotz, 50 birds, $50 a side; the best of birds.

Events 1, 2, 3, and 4 were $3 entrance:

Johnson, 30	01022—3	20221—4	22212—5	21*21—4

Crescent Athletic Club.

Bay Ridge, L. I., Dec. 20.—The shoot of the Crescent Athletic Club to-day was well attended, a match between the club champion and an ex-champion being a special attraction. Messrs. W. W. Marshall and A. W. Palmer tied for the December cup on and J. S. Schenck Remsen resulted in a victory for the present and J. S. Schenck Remsen resulted in a victory for the present club champion, Mr. Brigham, by a score of 92 to 85.

Brigham also won the 100-target event for the shooting committee's medal, scoring 95; Remsen was second with 93. The third contest for the December cup resulted in a tie between W. W. Marshall and A. W. Palmer, each of whom broke 50, with their handicaps.

December cup, 50 targets, handicap allowances added: W. W. Marshall (12) 50, A. W. Palmer (20) 50, L. C. Hopkins (12) 48, G. G. Stephenson, Jr. (4) 46, D. C. Bennett (8) 44, W. J. McConville (8) 43, F. B. Stephenson (2) 42, H. B. Vanderveer (6) 37.

Match, 100 targets: H. M. Brigham 92, J. S. Schenck Remsen 85.

Trophy shoot, 15 targets, handicap: L. M. Palmer, Jr. (1) 15, H. B. Vanderveer (2) 15, A. W. Palmer (5) 15, L. C. Hopkins (3) 13, W. W. Marshall (3) 11, R. D. Whigham (3) 11.

Shoot-off, same conditions: Palmer 15, L. M. Palmer, Jr., 14, Vanderveer 11.

Trophy shoot, 15 targets, handicap: A. W. Palmer (5) 15, W. J. McConville (3) 15, W. W. Marshall (3) 13, H. M. Brigham (0) 12, F. B. Stephenson (1) 12, L. M. Palmer, Jr. (1) 8.

Shoot-off, same conditions: McConville 15, Palmer 14.

Trophy shoot, 10 pairs: Dr. J. J. Keyes 8, L. M. Palmer, Jr., 8, H. M. Chapman 7, Brigham 6.

Trophy shoot, 25 targets, handicap: R. I. Whigham (6) 25, A. W. Palmer (10) 25, W. W. Marshall (6) 23, H. M. Brigham (0) 22, L. M. Palmer, Jr. (2) 22, H. C. Chapman (8) 22, F. D. Mead (7) 21, Dr. George E. Poole (3) 21, Dr. J. J. Keyes (1) 21, L. C. Hopkins (6) 19.

Shoot-off, same conditions: A. W. Palmer 25, R. I. Whighham 23.

Sweepstake race, 15 targets: Dr. J. J. Keyes 12, L. C. Hopkins 12, Dr. Poole 11, W. W. Marshall 10, D. C. Bennett 10, A. W. Palmer 10, H. B. Vanderveer 8, R. I. Whigham 8, H. M. Chapman 7, A. E. Vorlies 5.

Monthly contest, 100 targets for gold medal: H. M. Brigham 95, J. S. Schenck Remsen 93, F. B. Stephenson 85, W. J. McConville 82, G. G. Stephenson, Jr., 79, Dr. J. J. Keyes 54.

Felix—Bauer.

PHILADELPHIA, Dec. 20.—A live-bird match, 100 a side, was shot to-day between Messrs. A. Felix and Geo. Bauer. The race ended at the ninety-third bird, Bauer then being shot out. The scores:

Keystone Shooting League.

HOLMESBURG JUNCTION, Pa., Dec. 20.—There was some good shooting at the weekly shoot of the Keystone Shooting League to-day. The scores:

Darby trophy, 15 birds, 30yds.:

Roll	111121211211122—15	Harrison	121101112112112—14
Rothacker	222222202222202—13	Darby	222220222202202—12
Geikler	222222222202202—13		

Club handicap, 10 birds:

Roll, 29	2*21210101— 7	Harrison, 28	2111112111—10
Rothacker, 29	2222222222—10	Darby, 29	22022222*2— 8
Geikler, 27	222222222*— 9		

The following programme has been arranged for New Year's Day by the Keystone Shooting League, to be shot on the club's grounds, at Holmesburg Junction:

First and second events, 5 live birds, entrance $2.50, birds extra; high guns, three moneys, 50, 30 and 20 per cent.

Third event, 7 live birds, entrance $5, birds, extra; high guns, three moneys, 50, 30 and 20 per cent.

Fourth event, 10 live birds, entrance $7.50, birds extra, Rose system; three moneys, 50, 30 and 20 per cent. If over ten entries, four moneys, 50, 30, 20 and 10 per cent.

Fifth event, 15 live birds, entrance $10, birds extra; Rose system, three moneys, 50, 30 and 20 per cent. If over ten entries, four moneys.

Club house open and ready for service from 10 A. M. Scheduled events to commence on the arrival of train leaving Broad Street Station, at 1:10. Lunch served at club house all day.

PUBLISHERS' DEPARTMENT.

Driving Nails a Nerve Tonic.

IT is an odd remedy for nervous prostration, yet it is almost a sure cure, so says a well-known Southerner. Some time since a prominent business man in Boston, Mass., wrote Mr. John T. Patrick, of Pinebluff, North Carolina, asking him if the climate of the Pine Woods, where he resides, and where so many Northern people go to recover health, was good for those suffering from sleeplessness and nervousness. Mr. Patrick wrote: "We have many persons coming down here who can hardly get an hour's sleep out of twenty-four, and they are not here a month before they can sleep eight hours during twenty-four. Dr. W. C. Wile, editor of the New England Medical Monthly, of Danbury, Conn., has said that it is one of the finest places to sleep at he ever visited, and the doctor is up on nervous troubles. And Dr. J. Warren Achorn, the prominent specialist of Boston, Mass., who has had great success in treating over-worked and tired-out business men, sends us a great many of his patients, and one of his prescriptions is addressed to us, in which he directs us to put his patient to sawing boards and driving nails, and the results are wonderful. The working of the home lumber is healthful, the exercise is beneficial, and the man cannot think of himself as he drives nails. We have in this way aided Dr. Achorn in curing many of his patients. He has sent us men out of the stores, prominent editors, managers of factories, and even presidents of railroads. We have filled his prescription by putting these men to work, and by their sleeping in the open air as much as possible, some in tents, others in little shanties and cottages they would hardly think of going into in the North to keep out of a shower of rain, they have gained appetite, health, strength and weight, and it only takes a few days until a piece of Southern pork and corn bread tastes better to them than the best meal they can get in the Parker House in Boston, and if driving nails and sleeping in little shanties will bring tone, vigor and sleep to the over-worked man, is it not better than any medical compound? At first the business man, with his soft, delicate hands, hesitates to take hold, but after he has mashed his finger a few times, and gets his hands as hard as a farmer's, he begins to eat and sleep, and when he gets the chance to see himself in a mirror, he wonders what has brought the contented, happy look to his face, and the answer flashes to his mind, 'driving nails and living in a shanty.'"

A Charming Pleasure Place.

FEW winter resorts have the equal of Lakewood's advantages, which are, primarily, location, climate, and surroundings. At the end of a ninety-minute railroad journey you reach Lakewood. The winter home of fashion, culture and society. Fine roads in several directions lead to the hotels and cottages of the latter, of which there are many, and the life of their occupants is as merry as can be. The climate at Lakewood is at least ten degrees milder than at New York or Philadelphia, and by its situation in New Jersey's famous pine belt, there is an exhilarating healthfulness found nowhere else on the Atlantic Coast. The hotels are metropolitan in every sense, and every convenience imaginable is found there, including Sun Parlors, Palm Gardens, Artistic Tea and Music Rooms, and a wonderful appointed cuisine. There are innumerable opportunities for out-door life, and sports like Pony Polo, Golf, Cross-Country Riding, Coaching and Automobiling, are indulged in. The only road to Lakewood from New York is the New Jersey Central, and its express service is such that many New York business men travel daily between Lakewood and New York. To know about Lakewood write C. M. Burt, G. P. A., New Jersey Centray, New York City, for Book on New Jersey's Pines, etc.; it's free for the asking.

The Laflin & Rand Powder Co., New York, Chicago, Denver, San Francisco, has issued a calendar for 1903, which depicts a situation having a theme sure to arouse pleasant memories in the minds of all sportsmen. The bright glow of a fire, cheerily burning in the old-fashioned fireplace illuminates the cabin, in which are three hunters, one of whom, the eldest of the party, is descanting on the merits of Infallible, a package of which he holds forth in his hand as an object lesson. Of his two companions, one is listening in a pose of eager attention, while the other, preparing the coffee, is in a state of suspended action while listening to the wise man. The picture is entitled "It's Infallible." A man-of-wars man and a soldier, portrayed with much spirit on the margin, are suggestive of the powder's further uses. It will be sent to applicants by the Laflin & Rand Powder Co.

The illustrated catalogue of Marine Hardware issued by Anthony S. Morss, of Boston, Mass., is a fat little volume of more than 250 pages. It seems to contain everything that the yacht builder could possibly use, from a palm to a propeller wheel, and from a squilgee to a searchlight. Some idea of its size and variety may be had from the fact that the index alone occupies twenty pages in double column. Yacht builders, and those contemplating building should certainly send for this catalogue.

We have just received from the Almy Water-Tube Boiler Co., of Providence, R. I., their catalogue for 1903. The catalogue deserves more than passing notice, for it is particularly well gotten up, and contains a great deal of interesting matter. The pamphlet is well printed on heavy-coated paper, and the half-tones of the company's plant and of some two hundred yachts and steamers that are equipped with their boilers, show up to the best possible advantage.

Mr. Paul North, of the Chamberlin Cartridge and Target Co., Cleveland, O., in a letter of recent date, informs us that he has sent to Messrs. Schoverling, Daly & Gales, 302-304 Broadway, New York, a Parker gun, equipped with the Fulford single trigger, thus affording to the sportsmen of New York and vicinity ample opportunity to observe its practical advantages and workings.

The Marine Construction and Dry Dock Co., of New York, whose works are at Mariners' Harbor, S. I., not only build yachts, launches and sail boats, but also attend to the work of repairing and overhauling vessels and looking after and storing them and their rigging for the winter. Their proximity to New York makes them especially accessible to those desiring to have work done.

At the new plant of the Durand Manufacturing Company are constructed sail boats, power boats, row boats and canoes. The new foot-power launch which they are building is stated to have covered forty-five miles in nine hours—a remarkable record. This is a device often tried before, and Dr. Durand seems to have solved the problem that has puzzled so many mechanics.
